The first one decided upon was across the harbor, nearly opposite the one then occupied. The owner of the property agreed to build a suitable house and rent to the club. Plans for the building were drawn, but before anything further was done in the matter the property owner died. Though the upsetting of their plans at that time was somewhat discouraging, it was really a blessing in disguise, for it would have been a great mistake to have located the club at the head of the harbor, several miles from open water, and connected with it only by a narrow and tortuous channel. This channel at low tide is really the only navigable portion of the upper harbor, as our canoe club friends had learned by bitter experience. Many a time and oft they had been compelled to beat up or down that narrow way against wind and tide, with a vast expanse of hardly submerged mud flats on either side; and sometimes on return from a day's outing, had found their boat house several yards from the water's edge.

While the search for a site was going on, the very serious matter of financing the club was being considered. That was no small problem, for at that time, the year 1894, "hard times" were upon the country, and money was not plentiful.

After due consideration, the following somewhat novel plan was decided upon. The club (which had been incorporated in the meantime) would issue certificates of ownership in its property, both real and personal, upon which it was promised to pay interest at the rate of 4 per cent. per annum. The shares were

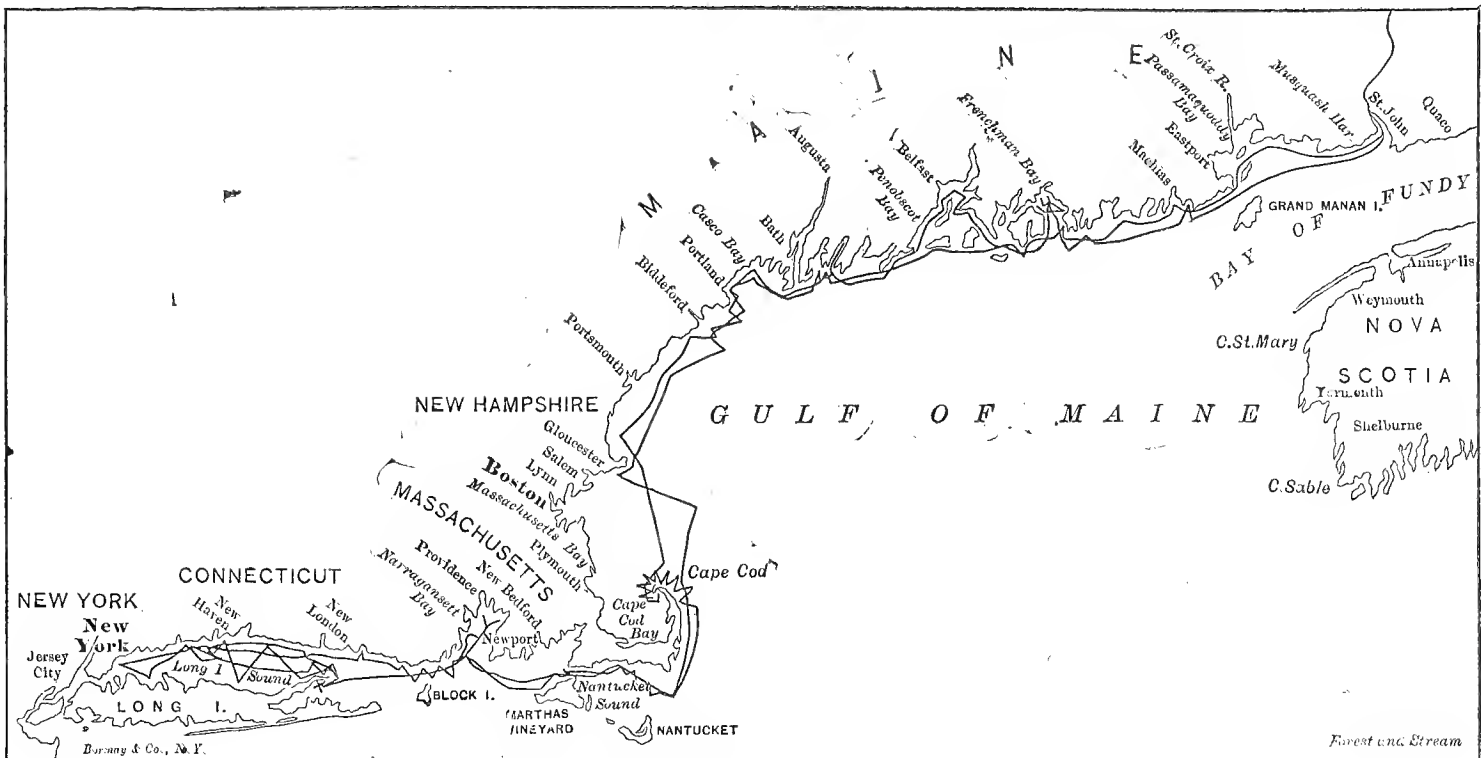

Chart of Course taken by Istar on Her Maiden Cruise.

of the face value of \$10 each, and it was provided in the constitution that each member must own and hold at least one share, beside paying an entrance fee. Ownership of them was not restricted to members, however, and a large number of shares were subscribed for by outsiders, who were interested in the club's success. Of course, many of the members subscribed for more than the one necessary share; some of them for blocks of five or ten shares.

It may not be amiss to mention here that this plan worked so well that it was adopted later, I believe, by the Grand Rapids, Mich., Y. C., and I quote here a portion of an article printed in one of the journals of

fied in entertaining ideas of a more pretentious establishment than they had at first considered.

Shortly before the time of which we are writing, a trolley road had been opened between South Norwalk and Roton Point, making accessible the delightful shores of the lower harbor. Probably the most attractive portion of those shores is what is known as Hickory Bluff.

Fronting on Wilson's Cove, a broad arm of the harbor, it commands a beautiful view of the picturesque Norwalk Islands, and beyond them the Sound. Here, it was thought, was the ideal spot, and ere long a building lot running through from the highway to the water

Norwalk Yacht Club House.

that city the year following the opening of the Norwalk Y. C.:

"At the annual meeting of the Grand Rapids Y. C., at the Morton, last night, C. B. Judd, H. Emery Pease and L. C. Stow were appointed a committee to consider the advisability of, and lay plans for, the erection of a new \$3,000 boat house at Ottawa Beach. Mr. Pease is also a member of the Norwalk (Conn.) Y. C., and he gave a talk on how a boat house was erected there."

Mr. Pease, who was one of the most active and efficient of the promoters of the Norwalk Y. C., moved to Grand Rapids shortly after its opening.

To return to the affairs of the local organization, subscriptions for shares and applications for membership were secured in such gratifying numbers that the outlook became very encouraging, so much so, in fact, that the committee on location and building felt just-

had been purchased and a contract for the club house had been let.

The formal opening of the new station took place on Decoration Day, May 30, 1895, and marked the commencement of a new era for Norwalk yachtsmen. The club house was a substantial and commodious structure, two stories high, with attic above. The first floor was fitted up as a storage room for the smaller craft, and was surrounded with lockers, while the one above made an excellent hall for receptions and dances.

A broad balcony, extending around two sides of the building at the second story, added to its attractiveness, and it soon became one of the most popular seaside resorts in the town. The membership of the club steadily increased, and it was not long before the century mark was reached. For several years past the average membership has been about one hundred and ten, running

Norwalk Harbor, L. I. Sound, from Hickory Bluff. Norwalk Y. C. House in foreground. Sheffield Island in middle distance.

up last summer to one hundred and twenty.

The incorporators and charter members numbered fifteen, most of whom had been members of the old canoe club. The first commodore was Mr. Gilbert E. Bogart, of South Norwalk, and the first vice-commodore Mr. A. E. Chasmar, of New York. Mr. Chasmar served six years as vice-commodore, refusing promotion until 1902, during which year he served as commodore.

Following Mr. Bogart, the office was most ably filled for three years by Mr. Philip G. Sanford, then a prominent member and officer of the Atlantic Y. C. Other commodores have been Messrs. Chas. B. Keeler, of New Canaan, 1899; Clarence F. Osborn, of Norwalk, 1900-or, and James A. Farrell, of New York, the present incumbent. Com. Osborn's administration was a most successful one, owing to his unremitting efforts to bring the club into close touch with our sister clubs on both sides of the Sound. His flagship, Gemini, was kept busy between New York and New London, and he never let pass an opportunity of persuading a yachtsman to enter our races or visit the Norwalk Y. C., while cruising. During his second term he persuaded Com. Banks, of the Atlantic Y. C., who is one of our members, to make our station one of the rendezvous of the Atlantic on their annual cruise. Their fleet arrived according to schedule on Saturday afternoon, Aug. 24, 1901, in the midst of one of the hardest downpours we have had in years. It rained so hard that it was almost impossible to see the vessels as they dropped their hooks off the club house. Their captains and guests were half drowned in the deluge, but in spite of its inauspicious commencement, their visit here was a memorable one. A smoker was tendered to our guests that evening at the club house. The weather had cleared, and all hands had a most jolly time, while the Norwalk boys improved the opportunity of becoming acquainted with the courteous and affable gentlemen from the historic club at Sea Gate, who honored us by being our guests. The following morning, Sunday, services were conducted on the Water Witch, the Atlantic flagship, by our chaplain, the Rev. J. McClure Bellows, now a chaplain in the U. S. Navy.

On Monday morning our visitors departed to the eastward, leaving a most pleasant impression in the hearts and minds of the members of the Norwalk Y. C.

Last summer, through the instrumentality of Com. Farrell, we were honored by a visit from the fleet of the Horseshoe Harbor Club, then on their annual cruise; and upon this occasion also we met our brother yachtsmen from Larchmont at a smoker and made the acquaintance of a host of "bang-up" good fellows.

The value to a club and its members of such fraternal intercourse, it seems to the writer, can hardly be overestimated.

In racing, the Norwalk Y. C. has not been especially prominent, though we usually have a goodly list of entries in the smaller classes for our annual regatta on Labor Day.

In closing this sketch, it is my desire to invite the attention of yachtsmen along the Sound and its adjacent waters—especially those who cruise in these waters—to the superior advantages of Norwalk or Sheffield Island Harbor as a port of call.

It is the only harbor worthy of the name on the Connecticut side west of New Haven. In its waters, between the outer chain of islands and the mainland, an enormous fleet of yachts may lie in safety, protected by natural breakwaters from the fury of the elements.

The main channel is half a mile wide, with from two to three fathoms depth of water and good holding ground. In fact, but a few years ago the New York Y. C. was seriously considering the purchase of a portion of Sheffield Island and the establishment of a station there.

Now that the new lighthouse at the outer end of the formerly dangerous Green's Ledge is in operation, the way into port is as plain and unmistakable as can be. The station of the yacht club is but twenty minutes by trolley from the South Norwalk railway station, bringing the club within an hour and a half of New York. There is a long-distance telephone in the club house, and ice and water may be obtained there, while supplies of all sorts may be had in South Norwalk.

Season after season the attractions and advantages of this harbor have become better known. Each succeeding year brings a greater number of cruising boats to the anchorage off our club house, and it is a question of but a short time before Norwalk Harbor will be one of the most frequented and popular of the harbors along the Sound.

### Little Shamrock Measurement.

CLEVELAND, O., Feb. 4.—*Editor Forest and Stream:* In a recent issue of your paper you published a correction, coming in the form of a sarcastic letter written by Mr. E. T. Balcom, of the Columbia Y. C., of Chicago. I never stated that Little Shamrock had not been measured by the official measurer of the Country Club of Detroit, and to settle this question, respectfully refer you to the article which drew forth this response from Mr. Balcom. The gentleman is fully aware that the design from which the craft under discussion was built, measured one-half a degree in excess of the restriction, and he gives a very unsatisfactory explanation of the facts, by stating the following, which appeared in the January 16 issue: "I can very easily comprehend how the bow could be measured on a drawing and found over the thirty degree limit, as on measuring three drawings of deck, it was found that one measured 30½ degrees, another exactly 30 degrees, and another 29½ degrees. This is very easily accounted for, as a reduction of a deck platform 36ft. to 36in. makes it so small that the minutest increase in inked line on the drawing will make an angle vary a half degree, one way or the other, or the slightest variation of pen or ruler will do the same thing, and such a measurement can only be determined by measurement of the deck of the yacht itself."

It seems to me that this is a very small way of dodging the issue, and Mr. Balcom, in reality, committing himself, by admitting that one design was a half a degree over the restriction, and gives an explanation

that one line being made slightly heavier than the other might be responsible for the apparent error. During my long experience as a yachtsman, and yachting writer, I have handled hundreds of plans, and have yet to see a design from a first-class naval architect, on which the work was so miserably poor that one line would be so much heavier than the other as to make a difference of half a degree. I should like to see a design of that kind, and would be especially interested to see if the signature was attached, giving the name of the man whose work it was.

I did not state that I had measured the craft, but received my information from Detroit, and it seems to be pretty reliable in that another allusion was hurled at my supposed informant.

However, my information did come from the source Mr. Balcom supposed. But believing that he could hit the nail on the head, he states the following: "Little Shamrock is laid up here, and can easily be measured, and thus stop all controversy on the subject, which seem to have arisen from the statement of a disappointed designer."

The disappointed designer, as Mr. Balcom terms him, was in no way implicated with the information I received, but as I have since learned, has a complete set of plans, from which the Little Shamrock was built, and by carefully measuring these plans, discovered the yacht to be according to her plans, and the plans from which she was built, one-half a degree over the limit. If the Shamrock is all right as she stands today, it is because she was not built to her lines; and there is little reason for any of us to suppose that if the builder did deviate from the plans, he would not make the mistake of going under. Rather, I think the tendency would be to go over, especially if he was trying to get the line as fair as possible.

I am exceedingly sorry that I cannot go to Chicago and measure the boat. If the opportunity ever presents itself, and I am given permission to measure the boat, I shall most assuredly avail myself, and will then give facts. However, at present, I can say no more on the subject, as the gentleman who informed me that he had the craft measured, is now in Europe, and until his return cannot procure the name of one who measured the boat, and found her to be in excess of this most important rule.

C. W. SCHMIDT, JR.

## Designing Competition.

\$225 in Prizes.

Two designing competitions have been given in *FOREST AND STREAM*. The first was for a 25ft. water-line cruiser; the second was for a 15ft. one-design class. Both competitions were very successful. The great interest taken in those competitions has prompted us to give a third one, open to amateurs and professionals. The prizes which will be given are as follows:

First prize—\$100.  
Second prize—\$60.  
Third prize—\$40.  
Fourth prize—\$25, offered by Mr. Theodore Zerega for the best interior plan.

The designs are for a yacht conforming to the following conditions:

- I. Centerboard cruiser, 40ft. l. w. l.
- II. Boat must not draw over 6ft with centerboard up.
- III. The lowest freeboard to covering board must be 3ft.

The design must be modern in every particular, without containing any extreme or abnormal features. The conditions have been made as simple as possible, that competitors might have all latitude and scope in working out their ideas. We wish to produce an able and comfortable cruising boat, one that shall have ample accommodation for two or three men living aboard for a period of several months, and one that can be easily managed at all times by two or three paid hands. The draft is restricted to 6ft. in order that the boat may have access to nearly all the desirable harbors, and may, thereby, widely increase her cruising field.

### Drawings Required.

- I. Sheer plan, scale ¾in.=1ft.—showing center of buoyancy, center of lateral resistance and center of effort of both rigs.
- II. Half breadth, scale ¾in.=1ft.
- III. Body plan, scale ¾in.=1ft.
- IV. Cabin plan, inboard profile and at least one cross section, scale ¾in.=1ft.
- V. Two sail plans, scale ¾in.=1ft.; one as a yawl; one as a pole mast sloop.

In the case of the yawl rig the position and height of the mast and length of gaff are to be the same as in the cutter rig. Plans must show working topsail and size of light sails.

VI. All ballast outside on keel except amount necessary for trimming.

An outline specification must accompany each design. The drawings should be carefully made and lettered. All drawings should be on white paper or tracing cloth in black ink. No colored inks or pigments should be used. The designs must bear a nom-de-plume only, and no indication must be given of the author. In a sealed envelope, however, the designer must inclose his own name and address, together with his nom-de-plume. All designs must be received at the office of the *Forest and Stream* Publishing Company, 346 Broadway, New York City, not later than March 1, 1904. All drawings will be returned, but postage should accompany each.

The *FOREST AND STREAM* reserves the right to publish any or all of the designs.

Mr. Clinton H. Crane, of the firm of Messrs. Tams, Lemoine & Crane, who passed upon the designs submitted for the 25ft. with great care, has again consented to judge the designs and make the awards.

Major H. D. Bulkley, of the Baltimore Y. C., has sold his steam yacht *Eleanor*, through Messrs MacConnell Bros., to the United States Government.

## Savarona—Auxiliary Schooner.

SAVARONA was built in 1903 from designs made by Mr. Arthur Binney by the Geo. Lawley & Son Corp. for Mr. C. Howard Clark, Jr., of Philadelphia, who wished to obtain a schooner of fair speed and with sufficient auxiliary power to drive her about five knots an hour in calm weather. The draft was limited so that the boat could go through certain canals, and could enter most of the small harbors along the eastern coast. The result was, as the plan shows, a boat of wide beam with ample accommodations, and with every comfort for cruising.

The dimensions are as follows:

Length—	Over all .....	92ft.
	L.W.L. ....	60ft.
Overhang—	Forward .....	14ft.
	Aft .....	18ft.
Breadth—	Extreme .....	19ft.
Draft—	Extreme .....	9ft. 3in.
Freeboard—	Forward .....	7ft. 6in.
	Aft .....	5ft. 6in.
	Least .....	5ft.

The main companion, from the deck, enters a steerage where there is a large locker for oil skins, etc., chart shelves, and toilet room with bath. The companion stairs are unusually wide and easy. This steerage is finished entirely in mahogany. Immediately aft of the steerage is the owner's stateroom extending the entire width of the boat, and long enough to give a good clothes closet at the forward end of the berths on either side. This room is larger than is usually found in a yacht of this size, and is finished in mahogany and white, the walls being covered with a blue striped damask. The cushions and carpet are in colors to blend with the damask, the whole making a very pleasing and bright effect. There is a toilet room connecting with owner's stateroom.

On the starboard side of the steerage is the guests' room, finished also in mahogany and white, the walls being covered with damask. There is a double berth in this room, also large bureau, clothes closet, and marble wash-basin.

The main cabin is a room 12ft. long and about 12ft. wide between the berths. Like the stateroom, this room is finished in mahogany and white, the walls being covered with plain green deco cloth, with upholstery, carpet and curtains to match.

At the forward end is a pretty Chippendale sideboard, over which is a large mirror. On the starboard side is a tiled open grate, and on the port side the buffet. There are also two wide berths, one on each side, writing desk, and ample shelf and locker room.

Forward of the cabin is the galley in which is located the gasoline motor. This is a 20 horse-power "Standard" marine motor, and sets partially below the galley floor, so that when not in use a very convenient serving table sets over it. The galley and forecabin are as usual in boats of this size, excepting that everything is left open as much as possible to give the best possible ventilation.

The gasoline tanks are located in the lazarette, one either side of the hatch, and are connected to the vaporizer on the engine by a double pipe. The greatest care was given to making and installing these tanks in every possible way to guard against accident. The tanks are cylindrical in form, are made of extra heavy tin-plated copper, strongly riveted, thoroughly braced and tested under slight pressure. The tanks fill from the deck, and the vent pipe is also taken to the deck, so that when filling these tanks no vapor can get below into the boat. The tanks are exposed as much as possible, being surrounded with an open frame work to guard against puncture, the idea being to at once detect any leak which might occur, and for this reason they were placed in the lazarette, where the sailors are in and out many times during the day.

The ample beam of Savarona has made her a most comfortable cruiser, while it has not detracted materially from her speed. On the wind she has shown up well, considering her moderate draft, but with started sheets she has shown unusual speed.

The engine drives her at nearly a six-knot rate, and has proved most useful and thoroughly satisfactory in every respect.

## YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

The Milton Point Ship Yard, of Rye, N. Y., have recently closed a contract for a high speed launch, to be built for Mr. J. Saunders Taylor, of Norfolk, Va. The boat was designed by Mr. Carl T. Forsburg, the superintendent of construction of the Milton Point Ship Yard. Her dimensions are: Length over all, 32ft.; waterline, 29ft.; beam, 4ft.; draft, 12in. Boat to have keel 2in. by 3in. white oak. Stem of white oak, 2in. sided, by 6in. moulded. Shaft log of white oak, 1¼in. by 6in., set on edge. Bilge stringers of pine, 1in. by 1½in. Floors of white oak. Planking of clear cedar, ½in. finished. Deck carlines to be of selected spruce, 1in. by 2in. sawed to shape. Plank sheer of quartered oak, ¾in. thick, and 3in. wide. Shear stake of quartered oak, ½in. thick, and 3in. wide. Decks of clear white pine, ¾in. thick. She is to have a nice roomy cockpit just aft of this seat fitted with camp chairs. This cockpit will hold, with comfort, ten people. At after end of cockpit will be large reclining seats. She is to have a 14 horse-power Buffalo reversing engine, and this engine will easily drive her at a speed of 17 miles an hour. Her rudder, propeller, shaft and strut will be of bronze. The design of this hull is very peculiar and according to the tetrahedral principle. This is an entirely new departure in designing where speed is the main object. By this principle of design there is very little resistance, and such boats do not settle by the stern. The waterlines of the boat are almost straight, and the entrance angle at bow is not more than half that of a boat of similar length and beam, but of ordinary form. The sharp angle of the waterlines and the straight lead of the lines along the entire boat

\*\*\*

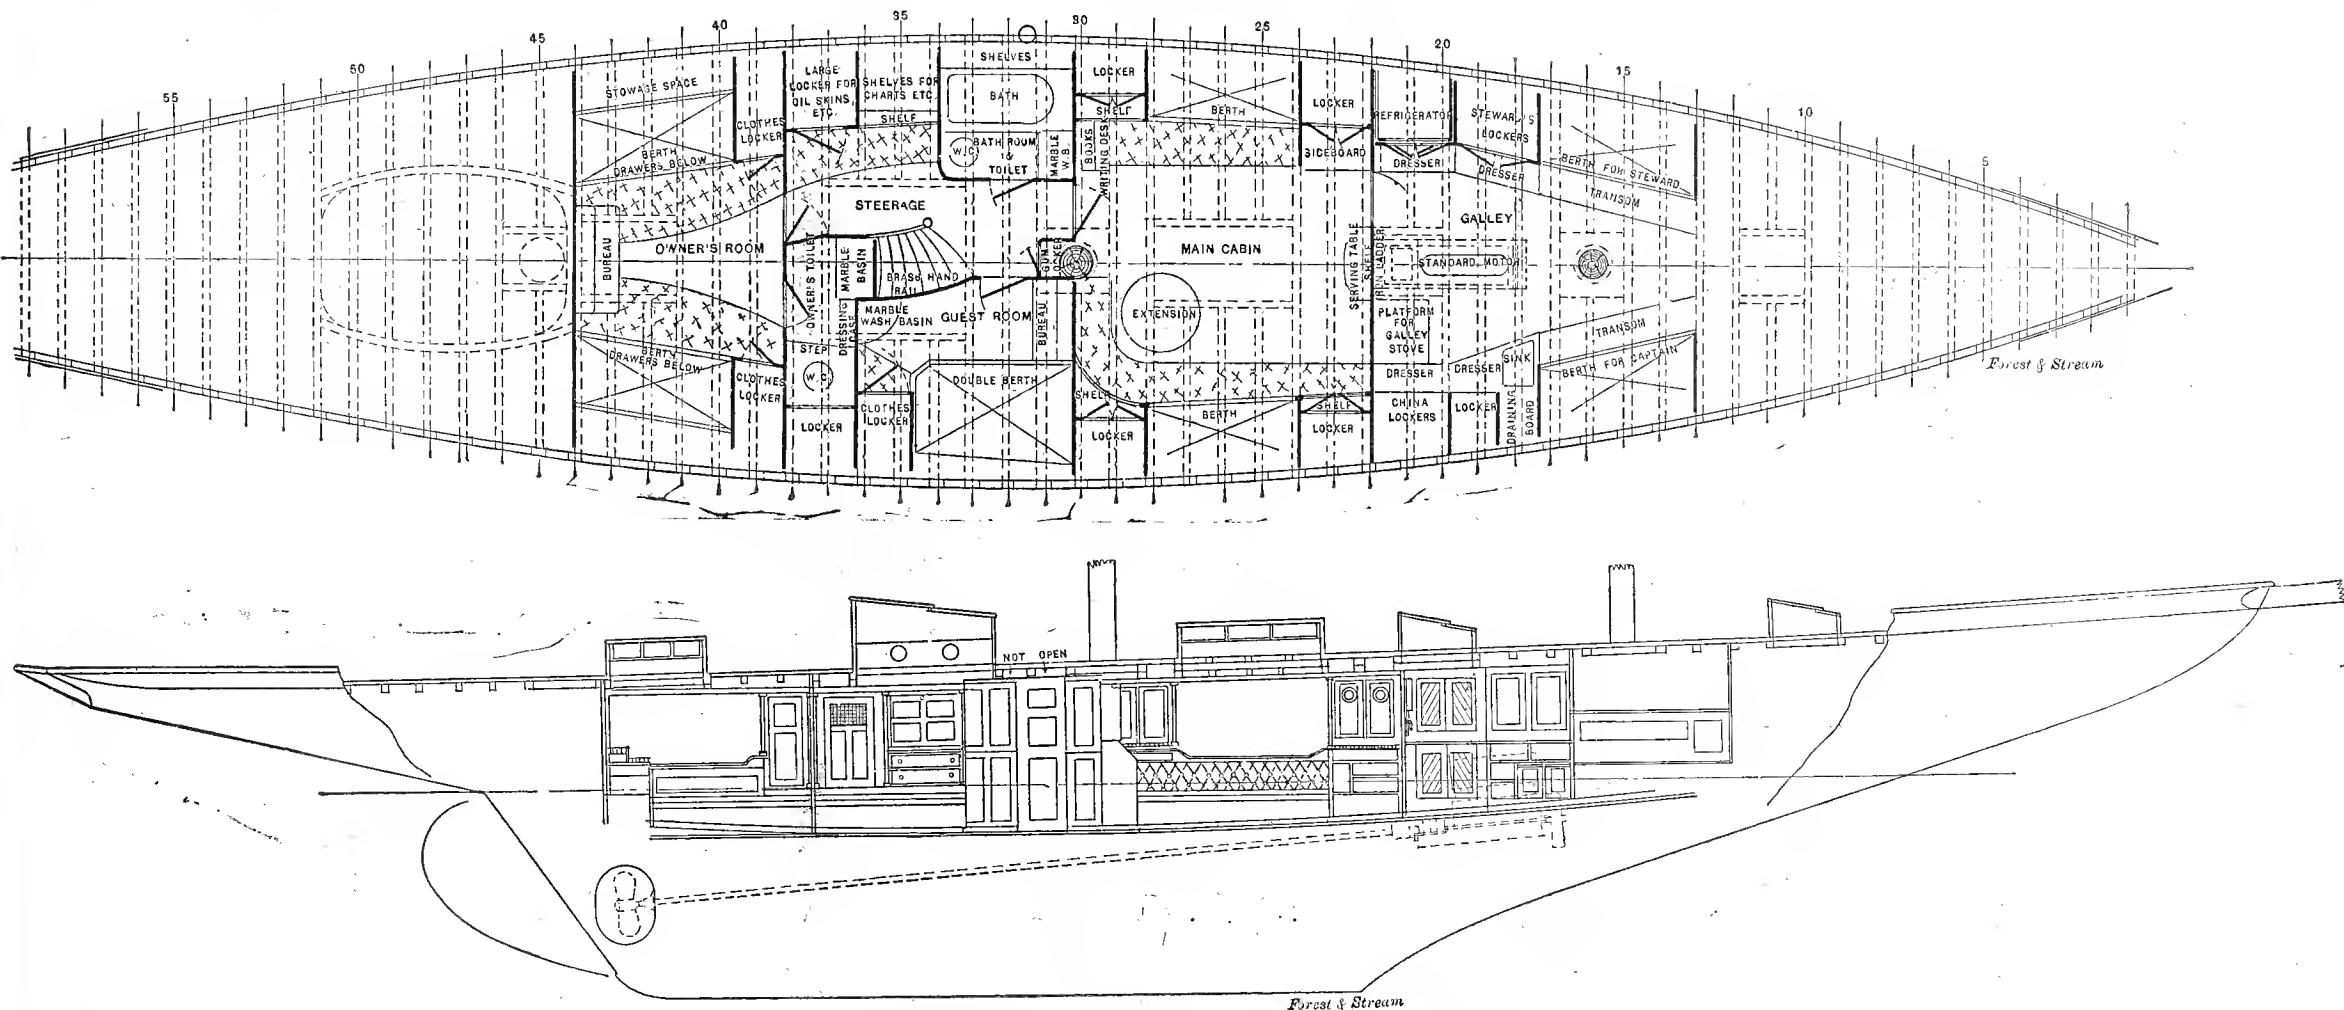

Adolph Schwarzmann, a member of the New York and Shelter Island Y. C., died at his home in Brooklyn on Feb. 4. Mr. Schwarzmann owned the steam yacht Turbese.

\*\*\*

The annual meeting of the Stamford Y. C. was held on the evening of Feb. 2 at the Surburban Club, at Stamford, and the following were elected to office: Com., Walton Ferguson; Vice-Com., James H. Herman; Rear-Com., Richard H. Gillespie; Sec'y-Treas., Herbert Lawton; Fleet Surgeon, Dr. A. G. Weed, Jr.; Meas., I. Franklin Wardwell; Chaplain, Rev. Harry H. Beattys; Directors, Wallace D. Barkley, Henry P. Bartlett, Geo. Blickensderfer, Clendenin Eckert, Geo. H. Hoyt, Charles H. Leeds, Lewis B. Moore, Alfred S. Pitt, Dr. A. H. Scofield, and James D. Smith.

\*\*\*

The annual meeting of the Corinthian Y. C., of San Francisco, was held on Jan. 26, and the following officers were elected: Com., Thos. Jennings; Vice-Com., J. C. Brickell; Sec'y, E. J. Bowes; Treas., W. A. Stringer; Port Captain, J. H. Keefe; Directors, Wm. J. Hogg, Orlo Eastwood; Regatta Committee, T. J. Cavanaugh, J. K. Bulger, Douglas Erskine. The club now has over

SAVARONA—AUXILIARY SCHOONER—CABIN PLAN AND INBOARD PROFILE—DESIGNED BY ARTHUR BINNEY AND OWNED BY C. HOWARD CLARK.

determine the small wave resistance, and small loss of power, due to the fact that the stream lines are not required, as in the common form, to follow a line of continually changing direction. Under the flat, broad run of the boat at the stern, the run to the propeller is entirely free and undisturbed. The rudder will be very effective, owing to the presence of but very little deadwood, and the boat will be able to turn around in a circle of about two boat lengths. Although this boat has but 4 ft. beam, it will have a most unusual degree of stability, owing to the width of the waterline aft. The stem will be given a long rake and overhang forward. The boat will be steered with horizontal, automobile steering wheel just aft of engine, and steersman can sit on cross seat above mentioned and steer, and send the boat ahead or astern by means of lever close at hand, or can start, stop, or regulate the speed of engine by means of throttle lever, which will also be handy. She will also have a whistle, the pressure to operate same will be taken from the engine. This is done by taking a little of the exploded gas, under high pressure in one of the cylinders at every stroke, and storing it up in a tank at nearly the pressure of the explosion in the cylinder. This tank is connected to the whistle, and the pressure of gas contained therein is always handy whenever it is desirable to blow the whistle. This boat will be used in the waters around Norfolk and Old Point Comfort, Va.

\*\*\*

The annual meeting of the Royal Nova Scotia Yacht Squadron was recently held and the following officers were elected: Com., W. G. Jones; Vice-Com., R. T. MacIlreith; Rear-Com., Richard Kennedy; Treas., William Parker; Sec'y, To be appointed; Managing Committee, H. W. Johnston, F. H. Bell, H. M. Wylde, G. Fred Pearson, C. B. Wikel; Auditors, E. J. Longard, W. H. Wetherby; Measurers, R. L. Lessel, W. Roue. The club is now in a flourishing condition and has a membership of 266.

\*\*\*

The annual meeting of the Riverside Y. C. was held at the Arena, West Thirty-first street, New York City, on the evening of Feb. 5, and the following officers were elected: Com., Geo. G. Tyson; Vice-Com., Wm. A. Hamilton; Rear-Com., Geo. J. Bascom; Sec'y, John G. Porter; Treas., Geo. T. Higgins; Meas., T. E.

SAVARONA—AUXILIARY SCHOONER—SAIL PLAN—Designed by Arthur Binney and owned by C. Howard Clark.

250 members and there are some sixty yachts in the club fleet.

The annual meeting of the American Power Boat Association was held on the evening of Feb. 3 in the Hotel Spaulding, West Forty-third street, New York City, and the following officers were elected: Pres., W. H. Ketcham; Sec'y, Anson B. Cole; Treas., J. H. Wainwright; Meas., H. J. Gielow; Executive Committee, Dr. E. B. Sherwood, F. N. Waterman, Frederick A. Hill and J. H. McIntosh. Provision is to be made for a new class in which the large boats of great power will race. From the general discussion that took place between the delegates there is no doubt that there will be a large amount of racing during the coming season. Several amendments to the articles of the Association were made, and among them was the following: "The Association prize pennant shall be an oblong flag, the size to conform to the size of boat, and the width at the halliards shall be three-fifths of the length. For the first prize, the pennant shall have a blue field with white propeller in the center, in the upper left hand corner the class letter, in the lower right hand corner the year; for second prize, it shall have a red field, with white propeller, class letter and year arranged in the same manner; for third prize, it shall have a white field with red propeller, class letter and year, arranged in the same manner."

Mr. Edward R. Cassidy, an artist of Philadelphia, Pa., has purchased from Mrs. Rosalie Tousey, of this city, the sloop yacht Nirvana, through the agency of Stanley M. Seaman. Her rig is to be changed to that of a yawl, and she will be used by her new owner as a floating studio in the vicinity of Nantucket.

Warrior, Mr. Frederick W. Vanderbilt's new steam yacht, was launched from the yard of the builders at Troon, Scotland, on Feb. 4. The yacht was designed by Mr. George L. Watson. She is 239ft. on the waterline and 32ft. 6in. breadth. Her engines are of 2,700 horse-power, and she is fitted with twin screws.

The racing schedule of the Yale Corinthian Y. C. has been determined upon and the first regatta will take place on April 16. The complete schedule is as follows: April 16, special race; April 23, first race for graduates cup; April 27, special race; April 30, second race, graduates cup; May 4, special race; May 7, third race, graduates cup; May 11, special race; May 14, first race for officers cup; May 18, second race for officers cup; May 21, third race for officers cup; May 25, special race; May 28, fourth race for officers cup; June 1, special race; June 4, special race; June 8, fifth race for officers cup; June 11, race for commodore's cup.

If yachtsmen would speak the same language by signals as is spoken by the international code in use by merchant vessels of all flags, it would certainly seem to be to their advantage. If yachts would even designate by some means the code of signal they are using it would be a good thing for all concerned, though why they should not stick to the international code for all general purposes seems to be a mystery. An instance of the disadvantage of using other codes is in the story of a schooner yacht which got aground in Long Island Sound one day. A steam yacht came along and ran up the international code signal: "Do you need assistance?" The men on the schooner were seen to look up their code book and then shake their fists at the steam yacht. Thinking this peculiar, the steam yacht men thought they would try their yacht club code signal, when they discovered, to their amazement and amusement, that the signal they had set offering very cordial assistance in the one code meant in their club code: "Open harbor, good holding ground."—Marine Journal.

Samuel Ayres, one of the best known of American boat builders, and the senior member of the firm of Samuel Ayres & Son, died at Nyack, from heart disease, on Feb. 3. Mr. Ayres was born in England, but when three years old his parents moved to the States and settled in New York. He apprenticed in a ship yard and in 1876 founded a business of his own. In 1893 he abandoned his yard in South Brooklyn and started in again at Nyack, N. Y. Many famous boats were built under Mr. Ayres' supervision, and he was well-known among yachtsmen and shipbuilders throughout the country. He leaves a widow and five sons.

At Mr. Joseph Fellows' yard, San Pedro, Cal., there is building a 24ft. waterline racing sloop for a syndicate of San Francisco yachtsmen. The yacht will be known as Mischief, and was designed by her builder. She will be 38ft. over all, 24ft. waterline, 10ft. breadth, and 6ft. draft. There will be 3,600lbs. of ballast on the keel, and she is to have 1,100 sq. ft. of sail.

The annual meeting of the New Rochelle Y. C. was held at the Republican Club, West Fortieth street, New York city, on the evening of Feb. 6, and the following officers were elected: Com., Joseph P. Donovan; Vice-Com., Harrison N. Vedder; Rear-Com., F. H. Waldorf; Sec'y, C. A. Marsland; Treas., John A. Van Zelm; Trustees, F. G. Provost, W. F. Vernon, and Frank Tucker; Meas., F. R. Farrington; Regatta Committee, D. W. Thomas, R. N. Bavier, M. S. Kattenhorn, G. P. Granberry, and E. S. Wright; Law Committee, J. F. Lambden and M. J. Tierney.

Ex-Commodore David Banks, of New York city, has decided to give up yachting and sell his famous schooner Water Witch. This fact is greatly to be regretted as he has been one of the most enthusiastic devotees of the sport for the last fifty years. He is a member of the New York, Atlantic, Manhasset Bay,

Riverside and Norwalk clubs, and was commodore of the Atlantic from 1892 to 1894, and during 1900 and 1901. Among other yachts owned by Mr. Banks were White Pigeon, Arab and Mutual. He has always been his own captain, having a master's license for all waters.

### New Advertisements.

The H. C. Doman Co., of Oshkosh, Wis., have been manufacturing for some time past a very reliable, strong and durable gasoline motor, and all their engines that are now in use have given the greatest satisfaction. This firm also turn out launch hulls, so they are in a position to furnish customers with the finished launch, complete in every detail. The H. C. Doman Co. guarantee satisfaction, and those interested in launches and motors would do well to send ten cents for one of their handsome and complete catalogues.

During the coming season the high speed launch will be in greater demand than ever before. If a man wants a fast launch he must first secure a properly designed hull, and then install in it a good motor, which, after all, is the main requisite for a high speed boat. The Hasbrouck Motor Works, Inc., West Mystic, Conn., make a motor which has met with great success, as is shown by the results given by the boats in which they are installed: Loon, a 36-foot boat, has made 13½ miles an hour; Reliance, a 37-foot boat, has run 14 miles an hour; Cricket, a 35-foot boat, has shown 16 miles an hour; Scout, a 30-foot boat, has a speed of 16½ miles an hour; Mystic, a 35-foot boat, ran from Execution Light to Race Rock Light, about 100 miles, in 6½ hours. All the above-mentioned boats were fitted with 16-H.P. Hasbrouck engines. The Hasbrouck Co. will duplicate any of the above boats and guarantee the speed not for a short distance, but for a long run of 50 miles.

## Trapshooting.

### Fixtures.

Feb. 12.—Shrewsbury, Pa., Gun Club tournament. W. H. Meyers, Sec'y.  
Feb. 12-13.—Paterson, N. J.—Jackson Park Gun Club tournament; live birds and targets.

Aug. 10-12.—Brantford, Ont.—Dominion of Canada Trapshooting and Game Protective Association's fourth annual tournament. A. B. Cutcliffe, Sec'y.

## DRIVERS AND TWISTERS.

Mr. C. A. Lockwood and wife are sojourning at Pinehurst, N. C., for the winter.

Mr. Gus Greiff informs us that he has severed his business relations with Messrs. Von Lengerke & Detmold.

We are informed by the secretary-manager, Mr. Elmer E. Shaner, that the Interstate Association will give a tournament at Bristol, Tenn., April 6 and 7.

Dr. J. B. Pardoe informs us that the Bound Brook, N. J., Gun Club has postponed its all-day shoot from Feb. 22 to March 12. There will be merchandise events.

The Herron Hill Gun Club, of Pittsburg, Pa., will give a tournament on April 26 and 27. \$100 will be added to the purses. Programmes and information furnished by Mr. Louis Lautenslager.

Mr. W. B. Allen, Secretary-Treasurer of the Trap Shooters' League, of Indiana, informs us that May 3 and 4 have been granted the Wabash, Ind., Gun Club, as dates for a tournament.

Mr. John S. Wright, the alert manager of the Brooklyn Gun Club, announces a shoot to be held on Lincoln's birthday, on the club grounds, Kaiser's farm, near Crescent St. Station, Kings County "L".

In the contest for the English Hotel cup at Indianapolis, Feb. 6, between Messrs. Jos. Michaelis and Fred Erb, the scores were 83 to 82 in favor of Michaelis. Dr. Moore, of Indianapolis, challenged the winner.

The programme of the handicaps at targets and pigeons, to be held at West Baden, Ind., Feb. 23-26, can be obtained of Mr. John L. Winston, the manager. Targets, 2 cents. Pigeons, 25 cents; "\$1,000 guaranteed and added."

Mr. Jno. M. Lilly writes us as follows: "The National Gun Club tournament, at French Lick Springs, Ind., strictly amateur; \$500 added money donated by Mr. T. Taggart. For particulars, Jno. M. Lilly, P. O. Box 463, Indianapolis."

The programme of the Shrewsbury, Pa., Gun Club tournament provides ten events, nine at 15, one at 10 targets, \$1.30 and 50 cents entrance, a total of \$12.20 and 145 targets, class shooting. Shooting commences at 10 o'clock. The Secretary is Mr. W. H. Meyers.

Mr. Elmer E. Shaner, Secretary-Manager of the Interstate Association, writes us that the Interstate Association has made arrangements to give a tournament at Nashville, Tenn., May 4 and 5, and one at Dallas, Texas, May 18 and 19.

The secretary, Mr. Wm. M. Foord, of Wilmington, Del., writes us as follows: "The Wawaset Gun Club will give a two days' shoot at targets on May 12-13, to be known as our second annual spring tournament. We will add money to the purses, and only amateurs will be allowed to shoot for same."

Mr. W. B. Allen, Sec'y Indiana League of Trapshooters, writes us as follows: "The Rensselaer (Ind.) Gun Club will hold their tournament, April 20 and 21, 1904, the purses to be contested for by amateurs only. At this shoot the contest for a silver loving cup valued at \$25 will occur. The winner this year is to receive 40 per cent. of the entries next year. Write Manager, Everett Brown, Pleasant Grove, Ind., for programmes, etc."

The secretary, Mr. John E. Bassett, writes us as follows: "Season of 1904, the New Haven, Conn., Gun Club will hold regular shoots the second Wednesday afternoon of each month, and will throw 50 targets free, for each contesting member. No other club ever did this. At the close of the twelve monthly shoots a \$20 prize will be given to the member scoring the largest number out of the possible 600 targets thrown free. No back scores to be shot up. Entries close 3:30 P. M."

Mr. Wm. Dutcher writes us that the Jackson Park Gun Club, of Paterson, N. J., anticipates a successful tournament on Friday and Saturday of this week, unless bad weather should supervene. The first event will be a preliminary at 5 birds, \$2. The second will be the main event at 15 birds, \$5, all surplus added. Ship guns and shells to G. A. Hopper, 40 Main St., Paterson, N. J., who will deliver them on grounds gratis.

The Detroit Sportsmen's Mid-winter Trapshooting Tournament has been fixed to be held on the Rush House grounds, Feb. 17-18. The first day will be at targets, sliding handicap; second day at live birds, handicap 26 to 32 yards. There are ten 15-target events, \$1.50 entrance, and one 25-target event, \$2.50 entrance. There are five 7-bird events, \$5 entrance, and one 15-bird event, \$10 entrance, for Gilman and Barnes medal. Shooting commences at 9:30. Ship shells, etc., to J. A. Marks & Co., 93 Woodward Ave., Detroit.

From a local paper we clip the following: "The Elk Gun Club was organized at Elkin, N. C., for target practice. A prize will be offered to the best shot. Mr. C. H. Gwyn has the reputation of being a very fine shot, and many of the others are also fine shots. The other members are T. R. Crumpler, L. C. Ashcraft, W. F. Weir, Alex. Chatham, Jr.; J. L. Harrison, L. H. Hunt, W. J. Price, J. C. Greenwood, E. F. McNeer, Will E. Paul, W. W. Whitaker, Wm. M. Bell, Geo. Bailey, R. M. Chatham, N. W. Tharp, R. E. Gwyn.

The programme of the Chicago Trapshooters' Association amateur tournament, Feb. 20, 21 and 22, has ten 15-target events, \$100 entrance on the first day; six 15-target and three 20-target events on the second and third days respectively. On the second day there is a special event, 30 targets, \$3 entrance, class shooting. On the third day, the Chicago Handicap, 50 targets, \$5, is the main event. The Rose system will govern. Watson's Park will be the place of contest. Manufacturers' agents may shoot for targets. High class amateurs, 19 yards; all others 16 yards. Targets, 2 cents. E. B. Shogren, Sec'y.

Messrs. G. W. Schuler, Gus Henkle and Emil Werk started for Florida on Feb. 2, and will probably spend several weeks on the west coast, in what is known as the Gulf Hummock game preserve. The party will do some hunting and fishing while there, but the chief object of their trip is to arrange for the purchase of this tract, which consists of about 160,000 acres of almost virgin forest. It is proposed to form a company of 100 members, with shares at \$1,000 each, thus making a capital of \$100,000. About \$60,000 of this amount, it is believed, will pay for the land, and the balance will be expended in the erection of club houses. This matter has been very thoroughly discussed by a number of wealthy local sportsmen, and gentlemen named go as a committee to ascertain terms, etc., and will report at a meeting on their return.

William McBlair died at his home in Normandy, a suburb of St. Louis, Mo., Jan. 24, after an illness of almost a year. Mr. McBlair was fifty-six years of age. He was a native of Baltimore, Md., but had lived in Normandy for more than half of the time of his active business life in St. Louis, extending over a period of twenty-five years. He was one of St. Louis' foremost business men, a member of the Merchants' Exchange, and the head of the firm of William McBlair & Co., whose offices are in the new Chemical building. He was local agent for the Hazard Powder Company for a great many years, and after these companies were consolidated, he became Southwestern agent for the E. I. DuPont Company, also of Wilmington, Del. He was a well-known sportsman, and a member of several clubs, among them the Glen Echo Golf Club, and the Normandy Country Club.

BERNARD WATERS.

### Patchogue Gun Club.

PATCHOGUE, N. Y., Feb. 1.—Our first shoot of this year was held on Jan. 30. No. 1 was at 6 targets, and was the members' shoot. No. 2 was a sweepstake at 6 targets. No. 3 was a miss-and-out.

## IN NEW JERSEY.

## Bound Brook Gun Club.

BOUND BROOK, N. J., Feb. 2.—Our secretary has asked me to hand you our scores of Jan. 30. We had an all-day shoot which was well attended. There were shooters from New York, Jersey City, Somerville, Flemington, Trenton, New Brunswick, Plainfield, New Market, Dunellen, North Branch, Grandview, Martinsville, etc. Mr. Jack Fanning won the gold piece for high professional average. Mr. Sim Glover won the gold piece for longest straight run, 49 straight. Mr. Tingley, of Trenton, made high amateur average. The programme consisted of 15 events. Events 1, 5, 9, and 15, were sweepstakes. The other events were for free merchandise prizes, entrance, price of targets only. They consisted of tea sets, framed pictures, jewelry, bric a brac, etc.

The merchandise events seemed to be very popular, and the shooters were well pleased. A vote of thanks was given the Bound Brook Gun Club for the hot lunch which was served free to the shooters. Mr. Tingley, of Trenton, won several prizes, including gold cuff buttons, and first money alone in the 25-target sweep. Mr. Rupell, of North Branch, N. J., won several prizes, including a fine brier pipe. Mr. Hunt, of Flemington, won a fine picture of the poets. Mr. Bisette, of South River, won a tea set and several other prizes. Messrs Wilson, Hobbs, Van Nuis and Corbender, from New Brunswick, were among the prize winners.

A squad of shooters from East Millstone were present. They ended the day by having an exciting miss and out event. Over 30 shooters were present. Much fun was had over the merchandise prizes.

Our regular club shoot comes on the third Saturday of each month, but Monday, Washington's Birthday, being a holiday, we will hold our club shoot on that day. Visitors are always welcome at our club shoot. We expect to shoot for a .22 Winchester on the 22d inst.

## Boston Gun Club.

Boston, Mass., Feb. 3.—The 1904 series of the Boston Gun Club was inaugurated to-day on their grounds at Wellington, and as usual a goodly number of enthusiasts were present to lend a hand to the good time. Many new faces were seen for the first time on our grounds, among them being Climax; Bartlett, of Harvard; and Gokey, of Watertown; the former having things all to himself on the 21 yards mark, and most assuredly made some very creditable scores, his 22 on the team match being a combination of good shells, good gun, and last but not least, good aiming. Bartlett, while not up to his usual form, will no doubt bear watching, and after getting used to the conditions of grounds, etc., will make tracks for the top of the list. Gokey, while a comparatively new acquisition to the trapshooting ranks, evidently will come later on; a strange gun-being quite disastrous for high scores. Haze Keller was there also, and seemed all the time to want to trim John Bell, the latter resenting such treatment not a little, though Haze did have the laugh on him in the team match, but John quietly shot the next event, and had the satisfaction of vanquishing his enemy with a straight score, the only one made during the afternoon.

In the prize match, Hodsdon, at 19 yards, was high, with 19, the tricky wind probably preventing a 21, though Keller and Bell had 18, and thought they shot like a streak. Others followed just one bird behind, and were very well pleased with the looks of the score board, as compared to what they expected. Other scores:

Events:	1	2	3	4	5	6	7	8	9	10

## Poughkeepsie Gun Club.

POUGHKEEPSIE, N. Y., Feb. 4.—The regular monthly shoot of the Poughkeepsie Gun Club, held to-day, was fairly well attended. The bitterness of the cold perhaps kept a few away, as well as being responsible for the rather low scores. Except for the county championship race, which was a walkover for Tallman, the events were well contested. This was a 100-bird race, and the holder of the medal and title, Capt. Traver, was defending it against Tallman, the challenger, as well as others, it also being an open event. Events 4, 5, 6 and 7 constituted this race, and after the first string it was seen that Tallman would probably be the easy winner that he proved to be. Du Bois won the club cup with a full score. Three men, Tallman, Rhodes and Marshall, tied for the Traver cup. In the shoot-off, however, Marshall scored a win with a full score. The cup events were run in with the championship race, events 4 and 5 constituting same, and No. 7 answering as shoot-off:

Events:	1	2	3	4	5	6	7	Events:	1	2	3	4	5	6	7
Targets:	10	10	25	25	25	25	25	Targets:	10	10	25	25	25	25	25

In the 100-target championship race the total scores were as follows: Tallman 34, Traver 73, Du Bois 74, Marshall 71.

S. N. W. W.

## Cincinnati Gun Club.

Twenty-three members took part in the contest of the Parker prize gun series on Feb. 6. The day was warm and clear, but a strong wind across the traps from the right made the targets very erratic, and the scores in some cases were not up to the average. Randall was high man in actual breaks, with 89, breaking his last 20 straight. Linn and Ahlers tied on 88 each for second place, and Dick came third, with 81. Eleven full scores, including handicaps, were made.

C. Dreihis was at the grounds for the first time in several weeks. He starts next week on a business trip, Middlesboro, Ky., being his first stop.

A. Sunderbruch has been under the weather lately, and was not in his usual form, but managed to get the best of Gambell in a friendly match at 50 targets.

Considerable practice shooting was indulged in, but everybody finished before dusk.

Capt. A. W. DuBray is in the city for a brief stay, before another missionary trip for the Parker gun. The scores follow:

Parker prize gun, 100 targets, handicap of added targets.

The first contest in the new cash prize series will be shot for on Feb. 13, and handicaps will be announced at that time.

BONASA.

## Independent Gun, Rifle and Pistol Club.

EASTON, Pa., Feb. 8.—At the regular monthly shoot held Saturday on the club grounds, the following scores were made;

Shot at. Broke.	Shot at. Broke.
J E Frederick.....190	140
E F Markley.....100	81
O Skeds.....75	62
D C Kendig.....50	26
H Boengle.....50	24
H Brunner.....25	18
C Markley.....25	16

Owing to the

## Indianapolis Gun Club.

INDIANAPOLIS, Ind., Jan. 30.—The fourth contest for the Julius C. Walk & Sons' cup resulted as follows:

Targets:	25	25	Hdep.	Shot at.	Broke.
J W Bell.....	22	23	5	55	50
W T Nash.....	20	20	8	60	48
O F Britton.....	17	24	8	59	49
Jos Michaelis.....	20	18	10	62	48
G Moller.....	19	17	12	64	48
R S Heaton.....	19	17	11	64	47
W B Allen.....	20	16	11	64	47
E C Deckman.....	16	20	10	64	46
J M Lilly.....	16	16	8	68	40
J C Dixon.....	18	11	9	71	38
R S Barrett.....	12	14	12	74	38
E J Armstrong.....	8	3	13	75	21

System of handicap used was to allow each contestant to shoot at as many targets as he failed to score in original shoot, and to add result of same to original score.

The fourth contest for the J. C. Walker & Son cup, was held on Jan. 30. The attendance and shooting were both much better than on the previous Saturday. The system of handicap used in this match is to allow each contestant as many extra targets to shoot at as he misses out of the 50. Figures in the handicap column indicate the number broken out of the extra targets.

J. W. Bell was high man, with 45 breaks, his score in the handicap giving him a total of 50. The score follows:

Targets:	25	25	Brk	Hdc.	Shot at	T'tl
J W Bell.....	22	23	45	5	55	50
O F Britton.....	17	24	41	8	59	49

	T. UMBELLUS.

## New York Athletic Club.

TRAVERS ISLAND, Feb. 6.—The weather was cloudy and it looked very much like rain all day. No doubt this kept a number of regular shooters at home. There was no wind, such as usually prevails at Travers Island. The shooting was therefore very easy. The first event was for the W. J. Elias trophy, which was won by Mr. G. E. Greiff, who also captured the second, special event, which was a handsome silver trophy. This was Greiff's first win for this cup, which has to be won twice to become the property of a contestant.

Event 1, 50 targets, handicap, for Elias trophy:

Brk. Hdep. Tot'l.			Brk. Hdep. Tot'l.				
G Bechtel.....	32	8	40	G E Greiff....	39	5	44
W J Elias.....	29	10	39				

Event 2, 100 targets, scratch: Bechtel 73, Elias 52, Greiff 83.

## Scranton Rod and Gun Club.

SCRANTON, Pa.—At the annual meeting of the Scranton Rod and Gun Club, held on Thursday evening, Jan. 28, the following officers were elected for the ensuing year: President, Chas. H. Von Storch; Vice-President, W. E. Bittenbender; Secretary-Treasurer, J. D. Mason; also the following Directors, H. M. Spencer, H. C. Cullen, T. J. Snowden and Jos. Shotto.

The shooting grounds are located along the Boulevard Road, near Parker street, and can be reached from the Central City, by

street cars marked, Providence, Carbondale or Marvine only. Get off at Parker street.

Shoots are held every Saturday afternoon when weather permits. The club proposes to make a special effort this coming season to enforce the Game Laws. J. D. Mason, Sec'y-Treas.

## Ossining Gun Club.

OSSINING, N. Y., Feb. 6.—The following scores were made at the regular bi-monthly shoot of the Ossining Gun Club. Gayl Hubbell got the final win for the rifle in the 25-bird distance handicap with the fine score of 24 out of 25. F. Brandreth and C. Blandford are tied for the telescope, which is second prize in this series. Next Friday, the 12th inst., the match shoot between this club and the Poughkeepsie Gun Club takes place. These are ten-man teams, and as the shoot will be open to all, a good crowd is expected. As we have announced before, the 100-bird event will start promptly at 1:30 P. M.

Events:	1	2	3	4	5	6	Events:	1	2	3	4	5	6

## Trap at Abilene.

ABILENE, Kan., Feb. 1.—Appended are scores made here Jan. 29, in a team shoot between C. T. Estes, Dr. H. C. Wann and Dr. T. R. Conklin on one side, and A. A. Glade, C. Stevens and H. S. Taylor on the other. The conditions were as follows: Each man to shoot at 15 live birds, 30yds. rise, and the losing side to pay for the birds.

The birds were nearly all dark blue in color, and an excellent lot of flyers, and with a stiff wind to help them along made some of them quite difficult to stop. The scores were as follows:

A A Glade.....	12211121212121—15	C T Estes.....	00110101221212—11
C Stevens.....	10111221101212—13	Dr Wann.....	01101100122211—11

## SIDE LIGHTS OF TRADE.

Mr. W. C. Danser, winner of the \$20 gold piece—second prize in the shoot, 68 entries, for a Knockabout gun, at Guttenburg race-track, Jan. 13, 14 and 22—killed from the 27yd. mark 59 out of 61. He used a Knockabout gun, for which Messrs. Von Lengerke & Detmold, 318 Broadway, are the sole agents.

## Rifle Range and Gallery.

## Fixtures.

Feb. 27-March 5.—New York.—At Zettler's, championship rifle gallery tournament.  
June 12-20.—National Schuetzenbund Festival, Union Hill, Schuetzen Park, N. J.

## Miller Rifle and Pistol Club.

HOBOKEN, N. J., Feb. 6.—At our meeting, held Feb. 3, the annual election of officers was held, with the following result: Captain, Owen Smith; First Lieutenant, Chas. Bayha; Second Lieutenant, R. W. Evans; Third Lieutenant, Chas. Miller; Ord. Sergeant, R. A. Goldthwaite; First Shooting Master, D. Dingman; Second Shooting Master, Herman Bahn; Secretary, L. Kneisel; Treasurer, J. Nelson; Trustees, J. Bischoff, J. Nelson, L. Kneisel. Shooting Committee: F. Unbehauen, R. A. Blake, D. Dingman, C. Miller.

Delegates to National Schuetzen Bund: C. Bischoff, F. Unbehauen.

Shooting Committee to National Schuetzen Bund: Capt. Owen Smith, Herman Bahn.

Scores of Wednesday night shoot: C. Miller 239, F. Unbehauen 240, E. Doyle 230, D. Miller 242, J. Bischoff 244, H. Bahn 232, R. W. Evans 244, D. Dingman 240, H. Meyns 235, W. Wahlstrom 232, A. Schwartz 239, R. A. Goldthwaite 239, Owen Smith 237.

L. KNEISEL, Sec'y.

## Cincinnati Rifle Association.

The following scores were made in regular competition by members of the Cincinnati, O., Rifle Association, at Four-Mile House, Reading Road, Jan. 31. Conditions, 200yds., off-hand, at the German ring target. Hasenzahl was champion for the day with a score of 224. To-day began a contest for trophies kindly donated by Mr. Ottomer Topf, of this Association. The members were divided into four classes, each class to contest for a gold medal, 10 best scores to count. The contest will continue for the ensuing six months, or thirteen shoots:

Hasenzahl .....	224	219	213	212	203	Gindele .....	214	213	210	194	..
Roberts .....	220	210	210	208	194	Trounstone .....	212	203	201	190	189

## Sunset Limited—California.

Via P. R. R., Southern Ry., A. & W. P., W. of Ala., and L. & N.

The Sunset Limited annex car leaves New York daily at 4:25 P. M., on the Washington & Southwestern Limited, which train is operated between New York and New Orleans, and carries elegant Pullman Double Drawing Room Sleeping Cars, Club Cars, Library, Observation and Dining Cars, making direct connection at New Orleans with the Southern Pacific's Sunset Limited train, leaving New Orleans daily at 11:55 A. M., which train carries Palatial Pullman Drawing Room Sleeping Cars and Observation Cars through to San Francisco without change.

For full information call on or address New York offices, 271 and 1185 Broadway. Alex. S. Thwait, Eastern Passenger Agent.

## Pennsylvania Railroad's Washington Tours.

The Pennsylvania Railroad's third three-day personally conducted tour to Washington will leave New York, Brooklyn, Newark, Elizabeth, and Trenton, Feb. 11. Round-trip rates—only difference being in the hotel selected in Washington—are \$12 and \$14.50 from New York; \$10.50 or \$13 from Trenton, and proportionate rates from other points. Tickets cover railroad transportation for the round trip and hotel accommodations. A special side trip to Mt. Vernon may also be taken. All tickets are good for ten days, with special hotel rates at expiration of hotel coupon. For itineraries and full information

## Zettler Rifle Club.

THE weekly shoot of the Zettler Club, Feb. 2, while restricted to a small number of members, was replete with interesting incidents. The first flurry was caused by Geo. Schlicht, who on his third entry made a full score of 250 points, the second full score that has been made in the Zettler gallery since it was opened in 1900.

The next incident of merit was the entrance of L. P. Hansen into the group with his outfit with him. Hansen's absence from the club's weekly shoots for several weeks past has been much deplored by the active members of the club. His brother members gave him the glad hand. Wm. A. Tewes, who has again taken up his work in the weekly contests after some weeks' rest, was present. Hansen shot 100 shots and made a score of 2442. Wm. A. Tewes got in touch with his rifle and ammunition and made the fine score of 1232 for 50 shots.

Ten-shot scores, 25-ring target, distance 75ft., 50 shots: L. P. Hansen 2442, L. C. Busse 2438, G. Schlicht 2432.

Fifty shots: Wm. A. Tewes 1232, A. Moser 1205, C. G. Zettler, Jr., 1202, B. Zettler 1197, C. G. Zettler, Sr., 1190, H. Fenwirth 1176, Aug. Begerow 1166, Geo. J. Bernius 1132.

## New York Central Corps.

THERE was a fairly good attendance of the members of the Central Corps at the bi-monthly shoot in the Zettler gallery, Feb. 3. In the contest on the ring target, R. Gute was high with 241 and 242. Gute was also first on the bullseye target, with a center shot measuring 54 degrees.

Ten-shot scores, 25-ring target, distance 75ft.: R. Gute 241, 242; D. Scharninghaus 240, 238; H. D. Muller, 236, 236; Geo. Viemeister 234, 234; J. N. F. Siebs 231, 225; Fritz Brodt 224, 234; B. Eusner 232, 225; J. Feldscher 231, 222; F. Schroeder 224, 223; F. Engelking 226, 217; C. Gerken 213, 228; W. Schillingman 226, 213; F. Schiller 210, 218; H. Schroeder 198, 226; A. Rohde 213, 208; G. Dettloff 224, 184; J. Kack 195, 223; H. Roffmann 211, 195; H. von der Lieth 200, 206; C. F. Tietjen 195, 193; H. Ficke 194, 191; J. Winters 201, 178.

Bullseye target, the best center shot to count, by measurement: R. Gute 54 degrees, F. Engelking 62, B. Eusner 74; Geo. Viemeister 82, H. Schroeder 95.

## Italian Rifle Club.

THE Italian Rifle Club held its gallery shoot Feb. 1. Twenty-one members were present. Minervini led the group for high score with 240. Selvaggi and De Felice tied for second place, each with 239. Muzio, Reali and Bianchi tied for third place, each with 238.

Ten-shot scores, 25-ring target, distance 75ft.: Minervini, 240, Selvaggi 239, De Felice 239, Muzio 238, L. Reali 238, Bianchi 238, G. F. Conti 237, L. Gallina 235, Gerbolini 233, G. Raimond 226, Del Sols 223, E. Orsenigo 219, Mastropaolo 218, A. Orsenigo 216, Gatto 213, Corbyons 210, Personeni 207, S. Fontanella 200, G. Fontanella 197, Ciancimino 197, A. Ronchi 175.

## New York City Corps.

TWELVE members of the New York City Corps were present at the gallery shoot of the corps on Feb. 4. Aug. Kronsberg, with 242 and 245, led the group for high score. Capt. Busse was second with 241 and 244.

Ten-shot scores, 25-ring target, distance 75ft.: A. Kronsberg 242, 245; Capt. R. Busse 241, 244; J. Facklamm 234, 239; O. Schwanermann 237, 234; A. Frank 230, 230; F. Kelle 211, 212; H. Vogel 212, 205; J. Keller 211, 202; W. Heil 204, 171; A. Wilt 159, 172; C. Schmidt 219, 219; H. Radloff 219, 219.

## Lady Zettler Rifle Club.

THE Lady Zettler Club will give a reception and package party to their friends at headquarters, No. 159 West Twenty-third street, on the night of Feb. 13. A large number of invitations have been sent out, and there is no doubt that the club rooms will be crowded. Henry D. Muller, the vice-president of the Zettler Rifle Club, has been nominated by the lady club as auctioneer for the occasion. John Laut is secretary to the auctioneer. Good luck to the ladies.

## Rifle Notes.

Wm. A. Tewes dropped into the Zettler gallery on Saturday night and shot a 50-shot practice, his five scores totaling 1232.

The New York Corps will occupy the Zettler gallery ranges on the night of Friday, Feb. 12. The eighty-six members engaged in this shoot make the gallery a place of interest at these meetings.

The annual gallery championship match and prize shoot under the auspices of the Zettler Rifle Club, will be held on Feb. 27, 29 and March 1 to 5 inclusive. There are twenty cash prizes, from \$15 to \$2. There are fifteen valuable merchandise prizes.

apply to Ticket Agents; Tourist Agents, 263 Fifth avenue, New York; 4 Court street, Brooklyn, or Geo. W. Boyd, General Passenger Agent, Broad Street Station, Philadelphia, Pa.

## Guides at the 1904 Sportsmen's Show.

A PICTURESQUE and exceedingly attractive feature of the Tenth Annual Sportsmen's Show, which opens at Madison Square Garden, Feb. 19 next, will be the exhibits arranged by guides from along the line of the Canadian Pacific road, and those from points further south in the Rocky Mountain Range. One of the exhibits is that of Mr. S. N. Leek, who comes from Wyoming with an entire hunter's camp and outfit. Mr. Leek is a practical experienced guide of national reputation among big-game hunters. Mr. L. C. Armstrong will prepare and manage the joint exhibit of the Canadian Pacific Railway Company, Hudson Bay Company, and the Province of Ontario. Mr. Armstrong will bring to the show seven guides in all, five of whom will be Indians, and two, ranchmen or cowboys.

## \$26.40 to Atlanta and Return.

Via Pennsylvania Railroad, account Meeting Department of Superintendence, National Educational Association, Feb. 23 to 25. Tickets on sale at New York at the above rate, good going Feb. 20, 21 and 22, and good returning until Feb. 27, inclusive. Apply to ticket agents in New York or Brooklyn.

## Why Not Shoot A BAKER?

Do you know that we build to order special Trap and Field Guns at \$60 and \$75 that, for efficiency and finish, equal most \$100 and \$150 grades of other makes?

NEW YORK, SATURDAY, FEBRUARY 20, 1904.

VOL. LXII.—No. 8.  
No. 348 BROADWAY, NEW YORK.

The "General Court" gave our grandfather Hamlin a tract of land in the "Province of Maine," in consideration of the services of himself and his three sons in the Revolution. He went down to view it in high expectation of a home for his old age and for his posterity. When he returned he reported to the "General Court" that there was an abundance of rocks and caves and bears, but hardly soil enough to grow a decent spruce tree. The caves seemed to be already well supplied with bears. They were in possession, they were the only rightful, or indeed, possible inhabitants, and he hoped the Legislature of Massachusetts would not disturb them. To this day it is called Hamlin's Grant, and only bears inhabit it.—REV. DR. CYRUS HAMLIN.

### A MENACE TO THE MOTOR BOAT.

A BILL has been introduced in the House by Mr. Grosvenor to regulate motor boats, the text reading:

#### A BILL

To amend an Act entitled "An Act providing for certain requirements for vessels propelled by gas, fluid, naphtha, or electric motors," approved January eighteenth, eighteen hundred and ninety-seven.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the Act of Congress approved January eighteenth, eighteen hundred and ninety-seven (chapter sixty-one, page four hundred and eighty-nine, volume twenty-nine, United States Statutes at Large), amending section forty-four hundred and twenty-six of the Revised Statutes of the United States, relating to vessels propelled by gas, fluid, naphtha, or electric motors, be, and is hereby, amended by striking out the words "of above fifteen tons burden," following the word "vessels," in the second line of said Act, so that said section as hereby amended shall read: "All vessels carrying freight or passengers for hire, propelled by gas, fluid, naphtha, or electric motors, shall be, and are hereby, made subject to all the provisions of section forty-four hundred and twenty-six of the Revised Statutes of the United States relating to the inspection of hulls and boilers and requiring engineers and pilots; and all vessels so propelled, without regard to tonnage or use, shall be subject to the provisions of section forty-four hundred and twelve of the Revised Statutes of the United States relating to the regulation of steam vessels in passing each other, and to so much of sections forty-two hundred and thirty-three and forty-two hundred and thirty-four of the Revised Statutes relating to lights, fog signals, steering, and sailing rules as the board of supervising inspectors shall by their regulations deem applicable and practicable for their safe navigation."

The measure is now in the hands of the Committee on the Merchant Marine and Fisheries.

Sections 4233, 4234, and 4412, referred to in the bill, have to do only with requirements as to light, signals, and sailing rules. The part of Mr. Grosvenor's bill which demands the attention of all who are interested in motor boats is the clause prescribing that these craft, if used for hire, shall be subject to the provisions of Section 4426. This section provides that "The hull and boilers of every ferryboat, canalboat, yacht, or other small craft of like character propelled by steam, shall be inspected \* \* \* and no such vessel shall be navigated without a licensed engineer and a licensed pilot."

This measure, it is understood, has been brought before Congress at the instance of masters and pilots of river and harbor craft who have had much disastrous experience with navigators of small power boats. The small boat in a harbor is the terror of ferry and steamboat pilots, and in river navigation there have been numerous instances where small boats have been run down with consequent loss of life, in which casualties the fault was with the inadequate and incapable manning of the small boats. There is sound reason, then, for the contention that all motor boats should be subject to whatever degree of regulation may be necessary to secure the end sought, which is that of safety to small boat and large vessel as well. Legislation designed to secure this should have the cordial support of all who are interested in motor boats, whether as manufacturers or as users. Whatever tends to increase the safety of such craft is for the interest of both classes alike.

But however good in purpose legislation on this subject may be, it may very readily be made too stringent and rigorous, so severe, in fact, as to defeat the aim, and prove detrimental and oppressive. Those who have studied the Grosvenor bill are apprehensive, because they see in it a menace to the small motor boat as a craft now coming into almost universal use for pleasure or convenience. This apprehension is caused by a rumor that there is an intention to amend the Grosvenor bill so that it shall apply to all motor boats, whether used for hire or not. In that event every boat would have to be provided with a licensed engineer and a licensed pilot. This could not but mean the abandonment of thousands

of such craft. It would drive out of existence the private motor boat owned by the man of moderate means. That Congress should adopt such a measure is fairly incredible; the bill so amended could pass only by an inadvertence or misunderstanding. The one thing, then, for the motor boat owners to do is to communicate with their Senators and Representatives, to the end that if the Grosvenor bill shall be adopted it shall go through as now worded, and without the mischievous amendment which is feared.

The occasion is opportune to secure also from Congress the provision of certain regulations which should apply to all small motor craft, even though used only for the pleasure or convenience of the owner. The nature of these regulations is outlined in the letter of Mr. E. M. MacLellan, secretary of the American Power Boat Association, to the Secretary of the Department of Commerce and Labor, printed in another column. The association, Secretary MacLellan writes, is in favor of requiring an examination of those in charge of power boats, more particularly as to their qualifications and knowledge of navigation, sufficient for the safe and proper handling of such types of boats. This, as is further pointed out, should not call for a license such as is granted to captains or engineers, but should be a special form of certificate conforming to the examination that might be required. This is entirely reasonable. Such a system, by increasing the efficiency of small boat navigators and giving increased assurance of safety in the use of small boats, would prove a constant factor in promoting their use and popularity. The horrible motor boat catastrophes which occur at not infrequent intervals may almost without exception be attributed to the ignorance or the carelessness of the man in charge. Every such casualty "gives a black eye" to the motor boat interest. They would be less frequent were the rule in force that no person should be permitted to handle a boat until he had given evidence of his fitness to do so with safety to himself and others.

The requirements suggested by Secretary MacLellan might wisely be added as an amendment to the present Grosvenor bill. They would do much to fix the status of the motor pleasure boat; and by providing all that is essential, would go far to remove the danger of that drastic legislation of which motor boat owners are now apprehensive.

### BOARDERS VS. BEARS.

THEY are discussing the proposed bear protection in the Adirondacks; and the more the proposition is thought about and talked about the less favor does it find. The notion that the Adirondack bear supply should be conserved appears to have sprung from the sentimentality of people who do not live in the Adirondacks; but the actual dwellers there, who are the class actually concerned, look at the subject in a hard, practical way. The consideration with them is of the bear in relation to dollars and cents. If the Adirondack bear is of use, they want it protected; if it is of no use, but a species of vermin preying on their sheep and frightening their city boarders, they want it exterminated.

The usefulness of the bear depends upon the stage of social development of the country it inhabits. Rev. Dr. Cyrus Hamlin, whose boyhood days were spent in a bear infested region of Oxford county, Maine, once wrote: "Bears are a very good element in early society. They call forth skill, pluck and dash." The Oxford county boy of his day "never felt bigger and prouder than when, with a ball rammed down on top of a partridge charge, he was pursuing a bear which he had seen at a distance, but never saw again." The bear killing by the young Cyrus Hamlin and by his cousin Hannibal, between whom existed a warm emulation in the pursuit, appears to have been for the most part theoretical. There was, perhaps, as is usually the case, more of large imagining of what they would do to a bear than of the actual doing; but we may well believe that the roaming through the bear woods of Oxford county had its part in developing the characters of the two boys, and fitting them for their careers of usefulness. Cyrus Hamlin was the first president of Robert College, Constantinople; Hannibal Hamlin was Vice-President of the United States in Lincoln's first term. It was near the close of his life that, looking back to his boyhood days in the grand old woods of

Maine, Dr. Hamlin wrote, "We pity the boys that have no bears in their woods."

But however good the bear may be as an element of early society, it becomes less useful and less tolerable in proportion as that society loses its primitive character. No society, however remote it may be from the great centers of population, can retain its early characteristics in the face of an influx of city boarders. We speak of the Adirondacks as a wilderness; but in reality the region is a vast caravansary for the housing of hosts of summer boarders. These boarders are not bear hunters; they are, in a vastly preponderating majority, women and children—timorous creatures affrighted of bears, startled at the very thought that there may be bears in the neighborhood, and paralyzed at the sight of a live bear at large. This being the condition of things, the Adirondack hotel keeper will tell you that he considers extremely silly this proposal to protect the bear tribe. Women and children and bears do not go together. He makes his money out of boarders, not out of bear bounties. As he sees it, bear protection is not a good business proposition.

It avails nothing with him to argue that the Adirondack bear is harmless and innocent as to the shedding of human blood. Popular belief will not have it so. There are thirteen million children in the Sunday schools of America; they have all heard of the bears which tare the children who mocked Elisha; and the notion of ursine ferocity thus instilled has been strengthened by the popular lore common to the race, which makes the bear a bogie. "Meeting up" with a bear in the woods, ninety-nine of every hundred summer boarders would run.

The Adirondack hotel keeper, who should seriously argue that bears should be protected in the Adirondacks would be regarded by his fellows as foolish.

As a part of the Pennsylvania Railroad tunnel system from New Jersey under the Hudson River and Manhattan Island and the East River to Brooklyn, there is now building at Long Island City a great power house. The site is a boggy swamp. To secure a foundation to carry the building with its thousands of tons of machinery, 8,000 pine piles have been driven down thirty feet or more, on which will rest the concrete bed on which the structure will be reared. The foundation of the immense New York Produce Exchange building rests on 15,000 New England spruce and pine spiles driven down to bedrock and cut off below the level of tidewater. The city's loftiest skyscraper, the 31-story St. Paul building, with its 20,000 tons of weight, is carried on a foundation which is supported on 4,000 spiles driven into the sand 40 feet to bedrock. The power house, the exchange, and the office building are typical. Each is supported and sustained by the strong support found in the forest.

THE practice of docking the tails of horses is engaging the attention of Congress, and a repressive measure has been introduced with application to the District of Columbia. It requires registration of all horses within the District having docked tails, and forbids docking in the future, or the importation, sale, or use of docked-tailed horses other than those registered under the act. A measure of like import has been introduced at Albany by Senator Armstrong. There should be no question of the enactment of both bills. The docking of horses' tails is a monstrous cruelty. There are no extenuating circumstances. It ought to be suppressed, and suppressed now.

THE British officials in the Soudan have adopted regulations for the preservation of game in a territory lying between the Blue and the White Nile and the Abyssinian frontier, and comprising an area of 300 miles in length by 150 miles in width. In this vast tract only persons bearing permits from the Governor are allowed to shoot. The game comprises elephants, lions, leopards, buffalo, hippopotamus, rhinoceros, and many species of deer and antelope. American sportsmen who may be ambitious to stalk the big game of Africa will find their opportunity here. The proper course of procedure is to secure credentials from the United States Consul-General at Cairo, purchasing one's outfit there, and thence proceeding up the Nile.

# THE SPORTSMAN TOURIST

## Floating Down the Mississippi.

V.—Some People of the River.

JACK STEVENSON was one of the thousands who had lost his home in a flood. Last spring the high water swept in on his little clearing on Kaskaskia Island, took away his house, his field and chicken coops, leaving only a barren waste. He saved and sold his poultry—300 or 400 chickens—his tools—planes, saws, drills, and what not of a Jack-of-all-trades, and these were in a big chest. During the summer he had lived in the warehouse, working a little for the local blacksmith, but now that fall was come, he found himself obliged to go somewhere and earn money. A brother at Carruthersville, 150 odd miles below Cairo, and rumor said that wages were booming at that place, and to Jack decided to go. He would join the human migrants of the Mississippi River and go to a better land.

First of all he built himself a Jo-boat 18 feet long, with a wider stern than bow, flaring sides 16 inches wide and able to carry about a ton in smooth water. It was in the water at the place I landed, and when we became acquainted, Jack said he was going down the river, too, and we could be company for each other. While I was at the old account books in the warehouse, Jack built an awning to cover his boat. It was old machine cover canvas, with slats crosswise to stiffen, and four sticks in a rectangle 5 by 9 feet square, to hold it over the boat, and swabbed with soft tar with which every landing and fisherman seems to be provided, to keep out the rain. If the wind struck it there was no danger because it merely rested on four posts high enough to clear Jack's head; it weighed only about ten pounds, and on hot days I envied him his shade.

Just after noon on October 10 Jack and I, with our duffle on board our boats, pulled out from Menard Landing, and the current took us more or less in charge. At Chester, a few miles below, is the Illinois State prison, and it is the most impressive spectacle along the river. There is a wide green lawn in front, the building is big, built of greenish stone, and behind it is a stockade of logs set on end, with sentry boxes at intervals along it. Within this stockade I could see men in striped suits shoveling sand on a big heap—a brilliant fashion of making useful citizens of worse than useless men. Fancy the ennobling ideas, the new life and character that a convict can get out of shifting sand from one side of a jail yard to another! Possibly these responsible for this would gain by a week or so at the same pastime.

We started hopeful of passing Grand Tower before nightfall, but little we knew of the river. It was coming on 4 P. M. when Jack began to suggest stopping somewhere, and then one feature of the man became apparent. He was fussy. He would think a place looked all right for camping, but next minute it would appear that the willows were too thick, the mud too deep, the place too exposed to the wind. Finally it came out that he was looking for sand, and I pointed across the river to a sandbar there, but he couldn't see it till we had dropped down half a mile, and then, "We'll go over there." By this time the current was setting away toward us, and in trying to cross straight over we were practically going diagonally up stream. My clinker skiff, hitherto not built right, nor the kind of a boat to have, according to Jack, would have done the distance fairly easily, but the heavy Jo-boat with tool chest and stove in it, was too much, and we hit land half a mile below our object, yet to me it seemed a better place, for behind the sandbar was a bay, with an entrance a foot deep. "No," Jack said, "I'll not go in there. River might fall and where'd we be?" "But the Chester bulletin said the river is rising," I suggested. "Can't tell anything about it! We'll find a good place down below."

By this time the sun was setting; nevertheless we went afloat, and pretty soon came to a wide chute, into which the water was pouring. I warned Jack that he'd be on the head of the island (?) or towhead, but he did not look nor alter his course till just too late, and went slashing down among the bushes and light drift. Meantime, being in some doubt as to where he was going, I hung back, and then went outside, only to be called inshore and up stream to a sandbar below the head of the island, and there we made camp; took out his stove and built a fire with wood gathered by lantern light, made coffee, and pot roasted a chicken—last of the old man's flock. He was jovial and cheerful, and each night thereafter he was so, no matter what the irritations of the day had been. Not long afterwards I tucked down in the stern of my boat, he in the bow of his, and we slept. Come morning and we ate biscuits and gravy and chicken, a delicious dish to the taste, but Jack put upwards of a pound of lard in every three-pound batch of biscuits, and this, with the coffee, invariably gave me a feeling of nausea for hours after every meal.

I have said that Jack was a riverman in the making. He came down to Kaskaskia five or six years ago in a house-boat of his own construction, after many years in northern parts, but subsequent years on land had rendered him nervous on the water. Below Liberty Bar, where we camped, were the Missouri Bluffs, and what is called the Water Level Road had thrown some rock

down, round which the water rippled fiercely enough to the ears. Jack started for the opposite side of the river at this, and then, it becoming apparent that the wind was coming from the west, we hustled back to the Missouri side, only to hang on the anxious seat because a steamer whistled ten miles away. Until that steamer came along we went dodging around wondering where the channel was, and finally crossed astern of the boat Cape Girardeau in the highest waves of the trip without anxiety.

I became nervous and irritable, for not knowing the river, nor what was to be expected, I had to follow the lead of one who knew what a wash a steamer could throw, and yet when the steamer waves came they were harmless, and we rode them safely. Nevertheless each time Jack would say, "I hear a whistle—it's one of them Lee Liners, we'd better go ashore somewhere," I'd follow—uselessly, I believed.

"Let's get in shore now, the current's better there," Jack would assert, and he would hug the land. Three or four rods out my skiff would run away from him when floating, save in bends where the water ran best close ashore. In spite of the fact that I had to back up frequently to keep within speaking distance of him, "it's a better current in shore" was constantly being heard. Sometimes we ran into an eddy, and it was days before Jack would give heed to my warning of "Eddy ahead!" Although running within fifteen feet of land, he would row steadily, and not look ahead once an hour. I did that for him, for since I discovered that the water had swelled the nose of my boat till it was crooked, and some of the side boards had pulled their nails loose, necessitating Jack's fixing it, I had feared for snags with constant attention. Time and again Jack told me of snags, "I won't hurt nothing!" and I suppose he felt the same way in regard to my pet aversion, the snags, as I did toward his, the wash of steamers. It is plain that we were neither one of us clay-lined rivermen.

The wind was blowing pretty hard when we neared Grand Tower and Tower Rock, at which geologists have guessed there was once a fall, over which the Mississippi poured in some previous age. Nowadays instead of a fall, the place is known to river people because of the suck there—and a suck is a fearful place. It is a whirlpool where the water races round, and in big ones timbers stand on end and are drawn down out of sight. Tell a riverman that there is a suck ahead, and instant attention is commanded.

We had been looking ahead to Tower Rock Suck ever since we started, and now that we were within a few miles of it, we stopped repeatedly to assure ourselves that we were not running into it unawares at the next bend. A cabin boatman told us to keep to the Missouri side. "That's the best way, and you'll be all right there"—a deliberate lie, but one rectified at Wittenberg by a storekeeper. A moderate wind and the suck ahead were enough to send us into Owl Creek for an afternoon, rather than run the risk of being caught by bad winds among the bad waters. While we waited I walked back on the bluffs, and saw hickory and oak and walnut trees in plenty, heard the cry of gray squirrels spite of the wind, and quite enjoyed myself. When I returned Jack had fixed up my hammock and put in two sticks, of which I had not thought, greatly increasing the comfort of my bed.

After a night on a dry mud bank under trees that kept off the cold and dampness, we went on down the river. It was a place full of interest. The bluffs coming together not far ahead, the possibilities of that suck, and the legends connected with the locality, combined to increase any feelings one might have in regard to the place, and not long afterwards we were in sight of the rocks and waters of our fears.

The keelboatmen, who used to tow their craft up the Illinois side at the Tower in tedious cordelling, have given way to steamboats, which in turn were driven out by the railroads. The Indians who waylaid the keelboats in the shadow of the cliffs to the east were succeeded by less violent whites. The slash of a railroad has forever destroyed the wildness of the Missouri side, and a whiskey advertisement, done in white on green, is on the most conspicuous part of the Tower Rock, but the suck is just as wild, treacherous and innocent appearing as ever. Jack laughed at it, and said he could go through it with his Jo-boat. Two or three years ago another man thought the same, and with his wife, two children, and a negress went into the whirl. The negress came out more dead than alive, but the bodies of the others were not recovered.

The Government sent a man to blow Tower Rock out of the place a few years ago, and he set off a charge or two of dynamite, but the natives of the region served unmistakable notice on the workmen, and the Tower was not destroyed. But these same natives permit a whiskey advertisement to remain unmolested in the most conspicuous place upon it.

The one place that led Jack to express a sense of beauty is just below the Tower Rock a couple or three miles. Here the railroad in going along the bank of the river cut into earth (clay?) almost white, and this cut contrasts vividly with the trees hanging to the brink above, making a scene that is impressive of just what a railroad can do when it gets at natural conditions. "Now, ain't that pretty scenery?" Jack asked,

But even this "pretty scenery" was forgotten when a boat was seen five miles away. We ran into a brook outlet, and after half an hour Jack decided we could risk it if we got to the far side of the river. The steamer was a snagboat, and I could only just tell them when her waves reached us, and yet within half an hour Jack heard a whistle ten miles away, and, seizing his oars, began to look for a good place to run to. "One of them Lee Liners is coming," he said, "and she'll be hell-whoopin' when she gets to this reach."

No matter what the day, usually about noon Jack would begin to eye the shore, and though the water was without a ripple, and bread and cold meat were in the grub cans, we had to go ashore, take out the stove, rustle wood and a fire in order to get Jack his coffee and have hot biscuit. My oil stove wouldn't do. In this way two hours were taken out of the day's run, though Jack claimed to be in a hurry to get down to Carruthersville; he really was, yet would make no sacrifice to that fact, a step toward the real river life.

On the evening of October 13 we were ashore at Buffalo Island. It had just come dusk when Jack came and touched me on my shoulder as I leaned to fix my boat for the night. He pointed across the water and I saw dimly a skiff being rowed rapidly down stream, but out and around us.

"He's a river rat. When he seen us he commenced pulling out, though he'd intended to land here," Jack said.

I am quite certain that most of the river people are as respectable as the average villager, but there are a few much worse than a village hears of once in forty years. One branch of this evil class is known as river rats. The sneaking, hurried motions of the one we saw at Buffalo Island being quite in keeping with their character. They are river tramps, living for a chance of theft for the most part, waylaying and murdering on occasion, but, as a rule, merely begging and petty stealing their way up and down the river. A most unpleasant feeling it gives one to know that one of these creatures is nearby, provided with a skiff whose oar-locks are noiseless. The cabin boat people do not hesitate to kill them on slight provocation, and farmers are only too glad to catch one of them at his tricks. With all hands raised against them, they survive, nevertheless, accursed of half the crimes of the river. Old Jack never failed to keep a fresh charge in his percussion cap Kentucky rifle ready for instant use at night, and he could shoot it, too, with astonishing accuracy up to fifty or sixty yards, killing mud hens from a wind-joggled boat, and hitting sticks stuck in the mud.

The proper season of the year to go down the Mississippi in a skiff is, without a doubt, the fall. There are then upwards of two months during which "pretty days" may be expected several times a week. A "pretty day" is one on which the sun shines warm, but not hot, the only breath that is felt is caused by being thrust through the air by the current. The enjoyment is not care-free, nor is it without stimulating effects, for there are snags in the wide, shallow portions as well as the sandbars; but the majesty of a river a mile wide, moving onward noiselessly, oil-smooth for the most part, and with the inertia of a million tons, cannot but enter into the mind of travelers with sundry and divers effects.

To the man who loves the wide sweep of a wooded valley, the far lines of the deep seas, and the wastes of desert sands, who has never seen the unimaginable power and send of the Mississippi, there is a new kindred sensation awaiting. The desert is a still, dusty waste, the wooded valley quivers, but only quivers, under the winds; the ocean waves, storm-driven, pound the beaches, but the Mississippi is its own power and motion gathered from the storms of a hundred thousand tributaries, and looks it!

And yet there is a meanness and smallness to it all, a malignant, harpy spitefulness shown in the ripples over the sandbars, in the hiss among the worn roots and branches of snags, and especially along the caving banks, where one may see that the water wears fastest among the roots of trees, sometimes so rapidly that eddies are formed, one most conspicuously in the upper reach of the bend below Commerce, where a great lone oak tree, beautifully formed, had been reached long before its time. It shows in the little chutes and bayous, in the swirls and boils indicating the unevenness of the bottom, and, above all, in the sediment, which, seen close at hand as it flows, is in a constantly changing series of viscera-like convolutions. Nor is it possible for one to overlook these unpleasant features; they are a part of the river, as the river rats are a part of the river people; but they do not detract from the interest with which the stream is to be regarded. That caution which Jack showed in regard to the waves of the river steamers is typical of it all. For a long time the wash of steamers may be harmless, lulling one into the belief of security, but each time one must watch out, for there is no telling when the Spirit of the Stream will add its own force to the steamer's waves and send them far to destroy what they can. Whatever I may have thought and felt when Jack was hunting the yon side of the stream, he was right. The word "fussy" expresses one phase of the river better than any other, and the man on it must be fussy himself.

RAYMOND S. SPEARS.

## In Old Virginia.

## XIX.—A Wild Turkey.

WHEN the subject of sport and sportsmen was up in the talks around the evening fire, "Cousin Buck" was often mentioned. He lived on his farm some six miles distant, and had quite a local reputation as an all-round sportsman. An invitation had been extended him to join us in a hunt, and he had been expected for several days.

Coming in one afternoon from a short trip alone, the small boy and his little black companion met me, greatly excited over the information they bore.

"Tousin Buck's tum," shouted the former, "and he brought a little doggy what walks easy and has dot a tail like a wat; and he's dot a big dun what shoots two times, and he is doin' to dif me a tatwidge shell when he shoots de shots all out of it; a wed one, and heap more bigger den yours, papa."

"Yaas, suh," cut in the little man Friday, before the small boy could get breath to resume. "Mistah Buck he done come, an' bring his dawg, hit a houn' dawg, an' he say hit good foh deah an' tucky; I heah him say so myse'f."

I found the gentleman at the house, and warmed to him from the start. Over six feet in height, very dark, deep set, kindly eyes; firm jaw and chin, nearly concealed by a heavy drooping black mustache; a laugh like a boy's, and a heart that seemed never to have aged any after reaching majority, he was a man to know and grow fond of. An enthusiastic sportsman, his long suit was the wild turkey, and he had the reputation of being the most skillful and successful hunter of this wary bird in the whole country.

If there was any one thing our visitor could do as well as shoot a gun, it was play the fiddle, and we made the rafters ring that night after supper when he demonstrated that fact.

Cousin Rob's room was general headquarters, and here we all gathered, including another cousin who had come in for the night, and spent an evening to be remembered.

The small boy flatly rebelled against retiring at his usual time, and when finally too sleepy to beg for "des one more," was carried to bed still trying to pat his feet to the rollicking tune.

A perfect day was the next, with a frost almost like snow, and a brightness like June. Our departure was delayed a little by the necessity of doctoring the right lock on Cousin Buck's gun, which had gone wrong, and finally refused to come entirely right in spite of our combined efforts. "Let her go," said he, "when it misses I'll try the other."

Gathering the remainder of our outfit we started off, taking only the hound with us, as the bird dog had been a little out of condition for a day or two and needed a rest. The hound was a runty looking little black-and-tan, Ino by name, who, his master said, would "hunt anything that wore fur or feathers." I was much pleased with the possibly wide scope of our hunt and the enthusiasm of my companion. I have little love for the pessimistic man in any walk of life, but my pet aversion is the pessimist with a gun. Like the old man who told his children that he had "had much trouble, the most of which never happened," I have had great sport in the field, much of which never happened, but just as you may suffer from the former, so you may get enjoyment from the latter. And now when my companion suggested that we try for a shot at a deer, and then hunt turkeys, taking the shots offered by the way at quail, rabbits, and squirrels, setting forth the prospects regarding each variety of game with earnest enthusiasm, I was more than pleased with the outlook.

"How far can you walk?" said he, as he began to mentally lay out our route. Had he asked that question three weeks sooner, candor would have compelled me to answer, "About a mile or two," but with the knowledge of the good things I had done in the past few days I boldly said, "Go as far as you please; I'll beg when I get enough."

"Well, we will go over to those pine woods first," indicating two wooded ridges about a half mile away, "and I will try to get you up a deer. They used to be in there, and when jumped go out by the two large white oaks about half a mile down yonder on the road. That will be your stand, and if the dog jumps a deer I will raise a yell that will put you on notice. Don't forget your buckshot shells when you get there, and listen for my whistle somewhere in below you when I have hunted the ground entirely out."

Turning off, I made for the point indicated, having several times noticed the trees in passing the road. I felt that the chance of jumping a deer was slight, as I had been shooting around and through the woods almost daily for two or three weeks, but then we had found many fresh beds, and only a few days before the Esquire and I had found the tracks of three deer in a piece of soft ground, evidently made the night before.

I was swinging along over the frozen ground about half way to the stand, when from far down in the woods, in the direction taken by my companion, I heard the hound open up. It set me sprinting for the oak trees on the road at a pace I could not have kept up long, and which soon put me in position to stop the deer I hoped was coming my way. I had barely replaced my No. 8's with buckshot, when I heard my companion's gun, and then silence, and knew that whatever it was he had stopped it. A half hour more of eager expectancy, and then the sound of his whistle down the road. Joining him, he reported a squirrel bagged, a covey of birds scattered back in a thicket, and no fresh deer signs.

On our way down to the birds a rabbit jumped in front of him, which he tried with the lame barrel of his gun, and its failure to respond is the only reason why I had the opportunity to kill that rabbit, as there was no more shooting needed, as a general thing, at game he held on when the gun fired.

We found three of the scattered quail, the first of which was neatly stopped by my companion, the second—a much fairer shot—I missed, and the third being anybody's bird, as we doubled on it in the thick brush, neither knowing that the other was in a position for a shot. The dog acted in a very interesting manner when we approached the birds, and as I never saw one of his

breed act under similar circumstances. Taking the trail of a bird he would creep on it like a fox, not pointing it, but going much slower as he drew near, affording almost as much assistance to the hunter as a bird dog.

No more birds offering, we hunted on across country to some timber where a small gang of turkeys had been seen, going by the mill pond in hopes of surprising a wild duck that might have dropped in for a night's lodging and lingered for breakfast. Reaching the edge of the timber the dog was sent on ahead, while we kept along where it was open enough for shooting, if game should flush in our direction.

"S-tah! S-tah! Ino, S-tah! suh," was the instruction given the dog by his master on sending him off, and although entirely unlike any dog talk I ever heard, seemed to answer every purpose to the two most concerned.

The dog struck a warm trail shortly after getting well away into the timber, which seemed to lead away from us, as his baying grew gradually fainter and then ceased altogether. My companion thought it most likely turkeys, and that they had flushed and gone on in the direction the trail had led. "Come on," said he, when we could no longer hear the dog, "we will have to do our own hunting until he gets back."

We soon proved our ability to go it alone by flushing another covey of birds, one of which we got down on the flush. The remainder scattered into a thicket on a swampy creek bottom sown with briars and thorn vines, and known to be the worst half acre of cover within ten miles. While I was scouting around looking for an opening, or at least a thin place, my companion calmly walked into the very thick of it, as though, like "Bre'r Rabbit," "Bawn and bred in a briah patch." He had two birds down before I got into the thicket. The growth was too thick and tall for me to shoot in, after getting into it, so I crawled up on a fallen tree and concluded to watch for passers by. A bird soon came my way, put up by the native who was tramping about in the thickest of it. I missed with the right and nearly fell off my perch trying to do better with the left. Another crossed in front, flying toward a steep bank, which dropped to my first shot. Marking it down, I waited a moment to see if any more were coming, and then climbed down and went after it.

"How many?" called my companion, who had continued to bang away at short intervals. I was in the act of stooping to pick up my bird, when it flew again, and cost me another shot. "Two," I replied, "the same one both time." He brought out three birds and a rabbit, and reported one winged; and another killed and lost.

Going up over a steep place, and out into the woods about fifty yards from where we had been shooting, the dog reappeared. He was coming toward us from among some treetops, and leading him about fifty feet was a very fine turkey. The gun instinctively leaped from my shoulder at the sight, but dropped back as I noted a mill off a hundred yards, the house near by, and remembered the amount of shooting we had just done close by.

"There is a turkey," I called to my companion, who was out to my right.

"No, that is the dog you see," was his reply.

"Dog and turkey, too," said I, "but it is a tame one; I see white on its neck." And I thought I did, as we stood shouting at each other, and the fine looking bird dodged about among the treetops, followed by the dog. My companion stood in a low place, where his view was obstructed, and could not see the turkey, so called out:

"If you do see a turkey it is not a tame one; shoot it, and shoot quick."

I smiled in a superior way to myself to think of his trying to catch me with such an old trick as persuading me to shoot a tame bird, but it was not one of the smiles that don't come off, for as that grand bird suddenly took flight and went out of gunshot before I could sufficiently recover from my surprise to move a muscle, the smile went with it. I felt as though I had acted like a fool, and yet could not have done otherwise. To shoot a turkey which by every known test and standard was clearly a tame bird, was something I could not do.

Neither of us had ever known or heard of this wary bird acting so, nor could we explain it. Without exaggeration or qualification the facts are given, and is but one of those many strange experiences that sportsmen have.

I mourned many days for that turkey, and the boys made merry at my expense around the evening fire. Rabbits were the next game, and it seemed a regular warren which we found in a weedy bottom. Four came out at one time, the first I missed with both barrels, the second my companion killed, and the other two gave me the unusual opportunity of a double, of which opportunity I made the most. Another rabbit, jumped a little later, had rather the best of it, both of us missing fair shots at it.

The dog had gone on quite a way in advance, and suddenly opened on a hot chase back towards us. My companion listened intently for a moment, and then motioning quickly said: "Deer, I believe. Get out into the open on that side quick as you can," starting on a run at the same time himself for the other side of the narrow strip of woods we were in. For the second time I made a record run for position, and with as little result as the first, for the game proved something other than venison, though what we could not certainly tell.

We had been getting so much out of the day that the noon hour had passed unnoticed, but now the unanimous sentiment was in favor of lunch. A negro cabin near by afforded an opportunity to procure drinking water, which was politely furnished, together with a cordial invitation to eat our lunch before their big wood fire, which we proceeded to do, both the warmth and the rest in chairs proving grateful to us.

As we were leaving, the mother of the two pickaninnies into whose hands I had dropped some small coin, paid me the compliment that I had come to expect from about every adult colored individual I met: "Ain't you Mis' Lady's husband? You is? I 'lowed you was. You sho' mus' be a good man to be good enough foh her." And then, probably in return for my kindness to the children, she added, while calmly looking me over from head to foot: "I 'lowed you was a little milk-an'-water city man, but you is plenty big, and a good looker, too."

In a general discussion of the negroes of that neighbor-

hood which occurred a few days thereafter, I was struck with the fact that the unanimous opinion seemed to be that the above mentioned woman was the most unreliable of any under discussion.

We took to the woods after dinner, and the little dog was soon telling us that something suspicious had been about. After trailing a little way he seemed to be stationary, and my companion announced that he had "treed." "Squirrel," said he, as we approached and found the dog baying around a very tall cottonwood. "Den tree, I am afraid," was his next remark, as we worked around through the thicket of thorn vines which grew in profusion. Stationing ourselves on opposite sides of the tree, we searched every limb up and down, and shook bushes to try to start the squirrel, but to no effect. Finally, about to give up and go on, I stepped back for a final look, and caught a quick glimpse of fur, down low where the big limbs began to fork. "I see him, low down near the first forks," I called.

A moment more and we both saw a gray squirrel making up the tree, and opened fire. He was high and stood three loads of the small shot we were using before coming down. As he fell, two more squirrels showed, one running into the broken end of a limb extending out towards my companion, and the other climbing for the top on my side. My first shot stopped the one on my side, and left it swinging from the limb, the second bringing it down.

"Look up," called my companion. "I think there is a hole in the end of the limb, but will throw a load of shot into it to make sure."

At the crack of his gun one squirrel sprang clear and came hurtling down through the air, while another dashed out and went up into the top like a gray streak.

"Take him on the wing," he shouted, referring to the squirrel in the air, but thinking that one safe, I was busily engaged in trying to overtake the one fleeing into the treetop. I missed with both barrels, but my companion killed by a beautiful snap shot just as the squirrel reached the very top. Going after the other which the dog had rushed when it lit, I found it hanging to the side of a tree about five feet from the ground, hard hit, and unable to climb higher. Seeing that it did not need another shot, I stood waiting for my companion, who was slowly making his way through the vines. Before he got to us the squirrel lost its hold and fell to the ground, turning immediately upon its back.

The dog, instead of closing in at once, began trying to turn it over, so as to get it by the back, but the squirrel was a fighter, and was in its chosen position. Reaching up it took a firm grip with its fore feet on each side of the dog's head, and set its sharp teeth through and through the end of his nose. With the blood fairly spurting, the poor little dog stood perfectly still, howling as only a suffering hound can howl. It was pathetic, yet ludicrous, and I could not help laughing, as I urged his master to hurry to the rescue. When he came up and saw the state of affairs, he refused to interfere, saying that the dog would never forget the lesson he was being taught, which was good for him. When the squirrel finally dropped off from exhaustion, the poor dog sat down, lifted up his voice and wept.

On the way home we bagged another rabbit and a pair of birds out of a small covey, and arrived with every game pocket filled. It was a large and varied assortment that we laid out on the table for the admiration of the household, but there was a large vacant spot where a turkey should have been.

Of all the good days there were none better than this.

LEWIS HOPKINS.

[TO BE CONTINUED.]

## "It Just Happened So."

PITTSBURG, Jan. 11.—*Editor Forest and Stream:* In *FOREST AND STREAM* of January 2, under the heading, "It Just Happened So," it is related, and doubted, that a Yankee ship captain in a South Sea port had seen his wife in a vision on the same night she died. By heredity, temperament, education, and training I am a positivist, and take no stock in the occult. I want proofs, but I know also we do know very little yet of the forces of nature surrounding us, hence have always kept an open mind on all subjects. We have wireless telegraphy to-day, the electric impulse traveling through the ether without the aid of wires. Why could not the human brain, in certain psychological conditions, emit certain impulses which could travel through the same ether, or another medium which exists, but which we have not discovered yet, and strike another brain, synchronized to the brain which emits the impulse, as may exist among persons who have strong affinity and affection for each other, as between husband and wife, lovers, friends, etc.? This is only an hypothesis, but all great truths and scientific facts first were hypotheses; for in discovering a natural law we create nothing, only find out a fact, which may have existed for ages! Here is an experience, among others, for the actual occurrence of which I can vouch:

When my maternal grandmother (née van der Meer-schout) was a young lady, she used to visit every day the village poorhouse in the rear of our place, caring for and feeding the poor, old, and helpless. Among them was an old woman called Soffiedje, for whom grandmother had an especial affection, which was reciprocated. Grandmother went to Paris on a visit to relatives, distance about 180 miles, and at that time—the beginning of last century—it had to be done by stage, taking several days, and there was no electric telegraph. Coming home from a ball, she threw herself, fully dressed, on her bed, and fell asleep, being tired out. Suddenly she awoke, and saw Soffiedje in the room, bidding her good-by in Flemish. She noted the date and time, for grandmother had a hard, intellectual, investigating Dutch head, with no space for superstition or nonsense whatever in it; really much ahead of her time, for a woman. Coming home several weeks later, she found, upon inquiry, Soffiedje had died the same day and hour, even taking in account the difference in time for different longitude. Explain who can; I admit I can't by any existing laws I know of, and won't try. I want more light on the subject, as on a great many others. After all, what we know by past discoveries, as recorded in books, which we call knowledge, may amount to a cubic inch, and all that exists,

even on this little ball of ours, and we don't know, may comparatively amount to a cubic mile or more. As Aristotle says: "The intelligence perceives nothing which the senses have not transmitted to it." Our senses—our means of perception—are still too imperfect. In the course of evolution we may learn more, gradually, but the old law is true: The more you know on any subject, the more you find out you know very little, for new and broader horizons open before you in accordance as you advance.

JULIAN THE FOXHUNTER.

## Natural History.

### Help for the Wild Creatures.

RIVERSIDE FARM, Byron, Illinois, Jan. 31.—*Editor Forest and Stream:* A long run of professional work, with its ever-present heart-ache and heart-joy—i. e., sorrow for the sorely afflicted ones, sympathy for all and joy with thanks to "Ti-ra'-wa" for those on whom he had smiled—is behind me. It is a cold, quiet, restful Sunday on Riverside Farm. I am just in from a run on the skis to the squirrel caches; there are six of them on the farm; these caches are generally empty salt barrels nailed and wired in the forks of a burr-oak tree, with the opening to the south, which is partly closed with a well secured curtain made from an old gunny sack. The wild ones like these caches. This supply of salt is very precious to them. It is their great medicine. Wild animals as well as tame ones lick the human hand because of the salts upon it. Some, like the porcupine, gnaw old boots and shoes and tool handles for the same reason. At first Sir Sciurus and his mates will cast the corn and walnuts out upon the ground and hide them in every nook and corner of the woods. If there be a large supply of food in the barrel they soon tire and leave it scattered about on the ground. They are not long in learning the comfort, convenience, safety, and value to them of the cache, after which much of their feeding is done in it.

A tragedy occurred in one of the caches. A pair of squirrels coming in to feed, found a dumpy, short-tailed rodent, the largest of the mouse kind, in the barrel. They knocked him about until life was extinct, and then cast his body out upon the snow, where it lay, one of the most eloquent trespass notices that the writer remembers to have seen. This rodent had long been a thorn in the side of the squirrels, for he had a large den in the tree cache below this one, an old elm. The entrance was within four feet of the barrel and his industrious family got away with a large portion of the food in the cache; too large, the squirrels thought, for they worked hard to gain an entrance to the den, stimulated in their efforts by hate and appetite, but were not able to effect their purpose. The rodents had, unfortunately for them, acquired a great liking for walnuts, so when only corn was put in the old cache, and nuts in the new one on the hill, the head of this interesting family of gnawers followed the ski tracks up to the cache, with the result mentioned, so the sign and circumstance of the ground seemed to indicate.

DR. A. J. WOODCOCK.

### Some Peculiar Cats.—I.

QUITE a while ago I intimated that I would like to write a series of anecdotes about eccentric or unusually intelligent animals of my acquaintance, promising to deal with facts, not fiction, and to refrain from extravagance.

Being a close observer of animals, and more sympathetic toward them than most men who essay a "strenuous" career, I have, naturally, been favored with experiences that would seem almost beyond belief to persons who regard "the lower animals" as mere meat, or servants, or money producers.

And (alas for mortal plans!) I had intended to take up dogs first, as I am more familiar with them than any other (or perhaps all other) animals; but, as I would be happy to please Von W., who asks for cat stories, and whose contributions to *FOREST AND STREAM* have given me much pleasure, I will give at least a few of the cats first place.

#### Pasht.

While staying with an uncle in Effingham county, Illinois, many years ago, where, by the way, the natural scenery is very charming, being about half prairie and half timber, each in small sections, and often alternated with singular regularity, we possessed a small, beautiful tortoise-shell cat with the above ugly Egyptian name. She was remarkably intelligent, astonishingly un-catlike in manner, and withal very lovable. She would stand erect on her hind feet on my hand, held as high above my head as I could reach, and dig with her fore paws into any hole or crevice I asked her to, dog-like, fearlessly, with all confidence in me. Do you think you can induce any common cat to do likewise? Try it and see. Although a cat is considered a climbing creature, and a dog the reverse, the cat is much more afraid of a fall. It is far easier to teach a dog to trust to artificial support, or to submit to an unnatural position.

A yet more remarkable trait of this cat was that I could "sic" her after a hog or other small animal precisely as a boy "sics" a dog! Of course she was not very formidable at a dog's tactics, but she would promptly and cheerfully pretend to give chase, even closing in on the enemy, and dodging about with well-known canine stratagems (sometimes apparently in earnest, especially if I followed and assisted by striking at the intruder); and, when compelled to retreat—which frequently happened—she did so gracefully and in good order—a very striking contrast with the frenzied, pell-mell, scratch-and-tumble escape of the average frightened pussy. It is very difficult to point out anything to a cat, or to cause it to notice anything at a distance. I have known many a child to fly into a rage because he (or, more probably, she) could neither coax nor compel the favorite pussy to look at the moon, or any other object of interest out of immediate reach. I think our Pasht learned to look at and pursue objects from close companionship with a very active and restless little dog, who had been allowed

to consider himself "the whole thing" in that household.

At last (after the manner of the usual female cat) she became a mother; but, unlike the ordinary cat, instead of trying to conceal her offspring, she came to us and told us about them—at least she tried to tell us, and we understood, which amounts to about the same thing—and conducted us to their nest, or, rather, a hen's nest, in a barrel, which had been peacefully appropriated. It was not a case of robbery or confiscation, for the hen had abandoned it of her own will. I don't believe I ever saw tinier kittens. They were but little bigger than mice; I think a coffee cup would have comfortably held the three. She seemed amazingly proud of the ugly, sightless little strangers, purring loudly, wallowing about them joyfully, then looking up at us with dancing eyes. And when cousin Kate reached down and fondled them in her quiet, womanly way, Pasht became hysterically happy, and plainly showed that she was much flattered.

Soon afterward—before they opened their eyes—Kate and I started out to visit a neighbor's house, where there was to be "a singing"—an old style country entertainment that preceded the musicale of to-day—when we were arrested by the cat, who behaved very strangely indeed. She came running after us, moaning piteously (the sounds were very human), real tears in her eyes, ran ahead of us, pushed back at us, pulled at our clothing, plainly saying, "Come back! Come back, please!" and would not desist until we consented to do so, when she guided us as quickly as possible back to the old log house containing the barrel. On the way she kept looking back anxiously, as if fearing we might not understand, or might turn away again. With a woman's quick apprehension, Kate exclaimed: "I'll just warrant that wicked old tom cat that's been prowling around here has come and killed her kittens! Poor Pasht! Poor Pasht!"

And she was right. Not only had the monster killed them, but evidently he had committed cannibalism, for in a few moments the heartbroken mother found a gory half of one of her darlings near by under a rose bush, and brought it and laid it at our feet, looking up into our eyes with a heart-melting expression I can never forget. Only once since have I seen anything like it on a feline face—and that face belonged to a kitten of hers, too—the sole survivor of a second litter. I was sitting in a rocking chair, and the little fellow was teasing me by catching one of the rockers and trying to prevent the motion of the chair. He was about the size of a rat, a bright yellow (I never liked yellow cats till I made his acquaintance), with the most beautiful blue eyes I ever beheld in anything less than human! I was reading, but I'm always watchful and careful when children—human or animal—are about me, and no one could have convinced me that I was soon to cause that playful and innocent creature unnecessary pain. But at last, when I thought he was going away, "tilted back" with a relieved feeling, thinking, "Now I'll get to rock a little." I like to be almost constantly in motion, and sometimes think quite seriously of contriving a rocking bed; would surely do so if I lived in a water mill, where the motive power would cost nothing. However, the tricky little scamp suddenly turned and thrust one tiny pink fore toe under the rocker just in time to get it badly mashed (but not entirely crushed, for I stopped the backward movement by a mighty effort before the full weight even of the chair struck it). Doubtless the pain was greater than a burn. Yet what did that kitten do? Did he give vent to a hateful, angry squall in the natural cat style? Not little Blue Eye. Instead, he uttered a low, plaintive moan, swiftly removed his paw, put it to his mouth, then hobbled away on three legs. Round and round the room he went thus, moaning and holding high the injured toe; and every time he came near the chair he sat down for a second, held that paw up toward me, and glanced sadly at me through his tears, while sobbing and moaning like a human child, and seeming to say: "Just look at my poor hurt finger!"

But whenever I tried to take him up to console him with pitying caresses, he would jerk away again, as if saying: "I know you mean well, but you couldn't handle me without making the hurt worse! O, I just can't bear it!" and make another tour of the room. This he did many times ere consenting to be taken into my lap; but at last when I caught him up and very delicately examined his wound, he, baby-like, appeared somewhat comforted, and gazed intently and gratefully into my eyes, the "pearly drops" still in his. I know there are cynical hard-hearted, "too scientific" beings who will laugh at this, and accuse me of being sentimental rather than accurate; but I note gladly that kindness and sympathy toward dumb brutes is one of the principal and most pleasing features of *FOREST AND STREAM*; and if the editors, contributors, and most of its readers should be generous enough to take my little story seriously, I can well afford to let the other fellows "smile in an amused and superior way."

But enough of the pathetic feline. I will now introduce one of the comical kind. His name was

#### Yellow Tom.

No, I have no romantic tale to spin of this cat (he had a remarkable tail of his own, though, and was quite a spinner, too). I shall confine my pen mainly to a description of his character and habits, which were certainly odd.

First, although he was destructive to wild birds, we allowed a pet meadowlark to associate with him freely, day and night, in the house and out, and he never harmed it once, nor tried to. It lived but one summer, finally dying of convulsions induced by eating too many dead flies (the said flies having been poisoned by tobacco). We generally tried to keep the lark in at night, but it preferred to roost on the ground out of doors, as it was a very early riser. Having one wing clipped, to keep it from flying too far away, it seems all the more incredible that a bird-catching cat should have allowed it to go about so long. He even allowed it to drink milk with him out of his own private pan; and sometimes he had to wait until it was satisfied first, for it would frequently peck and pinch his nose, and drive him back (which impudence he'd never have allowed from any of his cat acquaintances)! He did not resent the bird's arrogance, only looked disgusted, much like an indulgent grandfather with a spoiled child. If he was cruelly torturing a rabbit, I had only to catch him by the tail suddenly and

jerk him off the ground above it to immediately put an end to its misery—for he would reach down, seeming to stretch to twice his usual length, snatch it up, and tear it to bits with terrible ferocity; all the time hanging by his tail! At other times he did not show anger when I lifted him in that manner. Most cats instantly fly into insane fury if lifted by the tail.

He had the queerest appetite. He ate fruit—especially ripe tomatoes—corn on the cob (green or ripe), raw potatoes, soft candy, and the richest cakes and pies—sour pies as well as sweet ones! He liked the sourest buttermilk, and drank strong black coffee, with or without sugar! But I drew the line there, and did not allow him to become a tobacco fiend!

One day, having neglected to give him his breakfast, I was sitting in the back yard, facing the old log building mentioned in the other cat story, when, suddenly looking up, as if something special had caught the corner of my eye, I seemed to see a miracle. It was a stalk of ripe corn, bearing two small ears, moving slowly, horizontally, about a foot above the ground, butt-foremost! I should have said that the big end had already disappeared around the corner of the log house before my eye fairly caught the wonderful vision; but I plainly saw the latter half of the stalk, and at least one of the ears, ere the house hid them. Of course I sprang up and quickly followed; when lo! the mystery was explained, though 'twas still a wonder! That cat had one end of the stalk in his mouth; or, to be more particular, he had it about a third of its length from the butt, then it ran aslant across his back, the main weight being a little to his rear, and in this manner he had carried it from the near-by shock! I watched him drop the stalk in a convenient place, rip open the shucks from one of the ears, after the manner of a squirrel, and left him feasting when I went to call my uncle and cousin to witness.

"Yellow Tom" finally sickened and was considered incurable. He would lie in one's path and refuse to move, even if trodden on; nothing could startle him or attract his slightest attention; yet he lived on, and on, and on, for weeks. One day Kate dropped a sprig of catnip near his nose. The effect was magical. First he sniffed at it, then wallowed over it, and even tried to stand on his head. From that day he rapidly improved.

L. R. MORPHEW.

ARKANSAS.

### Squirrel and Cat Foster Mother.

It is not generally understood that there is any close familiarity between cats and squirrels, and therefore the following story will be a surprise to some naturalists.

A few days after arrival at our summer cottage at the beach, my youngest boy Harry discovered a squirrel's nest in a spruce grove near the cottage, in which were four squirrels probably five or six days old. Harry brought one of them to the cottage, and asked me if he could not keep it. I told him I thought it was too young to leave its mother. At the same time we had a cat with two young kittens about three days old, and I suggested that he might put the squirrel in the basket with the kittens, and perhaps the cat would take care of it. This he did, the cat making no objection. As the squirrel was two or three days older than the kittens it was stronger and master of the situation. Whether a cat's milk is richer than a squirrel's or there was a larger supply I do not know, but the young one with the kittens grew more rapidly and his tail fattened out days before those of his little brothers with their mother in the grove.

After a few weeks the old cat took a great deal more interest in the squirrel than in her kittens. She would play with it by the hour. There was no inside finish to the walls of the cottage, and the rough posts were exposed. When pressed in play by the cat the squirrel would run up the posts, and the cat would attempt to follow, and seemed puzzled and annoyed to think she could not climb the posts.

Another thing that worried the cat was that the squirrel would not allow her to carry it by the scruff of the neck as she did the kittens. She made many attempts, but the squirrel always made such a row that she had to desist. In their play if the cat attempted to box its ears, the squirrel would fasten itself to her paw, and the cat would have to lift its whole weight.

After it was full grown it would spend the day in the grove with its fellow squirrels, but would invariably return at night and sleep with the cat and kittens.

Although it often played with the kittens, they did not always enjoy it, as the squirrel was very rough, and had a fashion of jumping with outstretched claws on their back. It would eat out of our hands, and had no more fear of any of the household than the kittens. We also had a collie dog of which neither the cat nor squirrel had the slightest fear. He would sit close beside their basket and watch them for half an hour at a time. CANADA.

### Protection of Animals from Cold.

THE extraordinary and perfect protection of animals, more especially those of smaller size, from the effects of extreme cold, always commands my admiration. The fact seems to be ignored by poets, naturalists, and by practical men. When Keats wrote, in the "Eve of St. Agnes," "Ah, bitter chill it was! The owl, for all his feathers, was a-cold. The hare limp'd trembling through the frozen grass, And silent was the flock in woolly fold," it was certainly not as a naturalist. The owl, with all its feathers, was not a-cold. The smallest birds—robins and wrens, less than an ounce in weight—maintain their extraordinary temperature, higher than that of the human body, in consequence of the absolute perfection of their covering. It is true they die in the winter at times, but this is from want of food, not from the temperature; even those parts of their structure which are exposed, such as the feet, do not suffer from the cold. Their nervous organization is adapted to their life, and I have often wondered at seeing a robin perched on a heat conducting metal bar, such as an iron railing, when it might have selected a twig, which has much less power of carrying away the warmth of the feet. In nothing is the perfection of nature demonstrated more strongly than in this fact that a wren weighing less than an

ounce should preserve its high temperature in the severest cold. This insusceptibility to cold in the exposed parts of the body is manifested also in the feet of waterfowl, who rest on the frozen ice without the slightest inconvenience.

With regard to the natural covering of feathers and hair which so perfectly protects animals, it is obvious that its efficacy depends upon the absolute non-conducting power of the air which is entangled between the interstices of the feathers or hair, and consequently prevents the escape of the heat natural to the body of the animal. This is often ignored by practical men, who keep animals as they think from suffering from cold, while they are exposing them to much greater evils than if they allowed them to stay in a state of nature. Let me take a few examples. Pheasants are much more delicate, naturally, than common fowls. If reared naturally by the parent birds, pheasants are never in a house or under any shelter in their lives. Raised under proper natural conditions, they never have roup, cold, disease, or any ailment. Can as much be said of those that are reared under hens in coops? Take again the common fowls that are so carefully shut up in hen houses and protected from cold. Is their plumage or condition at all equal to that of those which are reared semi-wild in

the open without ever being in a house in their lives? Turkeys, as we know, are usually regarded by the farmers' wives as the most delicate of all poultry. They are about the hardiest, as those who rear them wild in the forests of the north of Scotland know full well. The interlacement of the webbing of the feathers, and their position in layers one over the other, with an exceedingly thin stratum of air between each, not only perfectly protects them from cold, but also from the inroad of rain. All the small birds that during the last disastrous summer have had to roost out in the trees in the open have been drenched nearly every day and night, and yet have not suffered.

A singular example of the slight appreciation of the non-conducting power of animal covering has just been made manifest. The glove makers have recently discovered that no thick, clumsily manufactured glove, preventing the movement of the human fingers, is equal to the thin skin of an animal, provided the hair is not removed, but turned inside so as to form a natural lining to the glove. Thus constructed, a glove is far superior to any artificially manufactured. In fact, it would be difficult, if not impossible, to construct a woven material whose power of preventing the escape of heat would be equal to that of a skin and fur of

equal stoutness. Many other illustrations will present themselves to every observer of nature.—W. B. Tegetmeier, in London Field.

### The Attitudinizing Woodcock.

ONE evening in November, many years ago, a country friend brought a live cock woodcock to my house in Byron, Illinois. A spent shot had made his capture possible; in fact, one could not see that he was hurt in any way, after a sharp, scrutinizing search under a powerful light on the kitchen table. All at once the beautiful creature slipped from my hand, and, assuming the air, mien, and ways of a turkey gobbler in the mating season, proceeded to strut about on the table in the circle of powerful light. It was one of the strangest, wildest, most beautiful sights the writer ever beheld. After a solid hour's performance, the little audience decided that no taxidermical touch should ever desecrate that beautiful feathered form, and the bird was gently slipped into the pocket of an old hunting coat, carried a mile out of town into the country, and turned loose in the edge of a hundred-acre cornfield, into which he quickly scuttled.

DR. A. J. WOODCOCK.

### Canvasback Shooting.

TOWARDS the middle of October, when the later frosts have browned the earth with November tints and turned the crimson autumn leaves to sombre yellow and russet, there comes a day that is gray and cold, accompanied by a roaring northeast wind and a threatening, stormy sky. Some time before its wintry blast has been felt by those ensconced within the limits of civilization, it has stirred the wildfowl from their northern haunts, and the migration to new feeding and warmer climes has commenced.

It is now that the sportsman's eye turns eagerly toward some coveted shooting resort, where he knows of a wide blue bay surrounded by acres of marsh land interlaced with numerous waterways, and which this change of weather has undoubtedly filled with ducks. Thus, when the impulse moves, action follows, so one wet, blustery evening, the Veteran and I packed our shooting paraphernalia and started for the West, where we anticipated bagging more than one plump old canvasback before our return.

Arrived at our destination, we found the snug little hunting lodge situated on a large island in the marsh all in readiness, with every comfort at hand that could be wished for, and this, together with the cordial greetings of friends, old and new, proved a warm welcome.

Pete, the Veteran's old and faithful punter of many years, gave us glowing accounts of the hundreds of canvasbacks swarming in the bay. "I never see so much ducks," he said. "Clouds of 'em," giving emphasis to his words with a thoroughly French gesture and waving of stout arms. "But you bet we'll burn those ole fellers come a good wind 'long!" For several days the weather continued mild, with scarcely a breath of wind from any point, and of course these conditions were decidedly unfavorable for duck shooting. The birds, in fact, remained out on the lake during the day, sleeping lazily in the sun, and not coming back to the bay until nearly dark, when they fed all night to their heart's content undisturbed. Pete was unconsolable, abusing the weather in strong terms, and going around with a distressed countenance. "Did you ever see such a bad luck," he muttered continually to himself; and not until one evening when ominous clouds had banked up in the south did his face brighten.

"We are going to have a change, I think," said the Veteran, whose eye and weather calculations are as good as a barometer, "and if it rains there is a chance that the wind may shift to the northwest and blow hard."

"Then you bet I be down here afore daylight," remarked Pete, with growing jubilation, "an' wake you folks up early, so's we can get a good whack at them ducks while they're stirrin' round." Before turning in that night I went to the door of the cottage and took a survey of the weather. A gentle rain was falling with a soft murmuring patter on the roof, and far out in the marshes I could hear the quacking of some old mallard as he called to his mates in a distant, misty pond hole.

It was pitch dark the following morning when I awoke to hear Pete clattering and clumping around the next room, making fires and conversing with himself in low suppressed tones. The warm glow of the stoves and a fragrant aroma from the kitchen caused everyone to turn out in short order, for Al, our faithful adherent of the culinary department, had been astir early.

"Where are we going?" I asked the Veteran across the breakfast table, at which we were seated enjoying a hot, tasty repast.

"I think we will take East Point," he answered; "if we don't do well we can shift to Middle Point."

"All ready," announced Pete, at this moment poking his head in the door with a beaming smile. "We must get 'long pretty quick, fer it's stopped rainin'. You bet I take plenty of decoys, too," he added with a significant nod.

Fifteen minutes later we were pulling down the gray, squall-swept river that emptied into the bay some distance below, our duck boats running easily before the stiff northwest wind, while we breathed in deeply the cold bracing air, for, as Pete had said, the rain was over, and several lurid streaks of golden sky broke the dark clouds in the eastern horizon. As we came within sight of the bay, two or three hundred mud hens jumped from the water and spattered awkwardly over its surface to a place of safety. But beyond these was the sight that made us hold our breaths with wonder, and experience those remarkable sensations to which all sportsmen are subject when any large quantity of game presents itself to the vision. With a roar louder than an express train, a cloud of canvasbacks arose from the water, their silvery plumage flashing and gleaming as they swept around the bay in several great columns, and, finally uniting in one body, they streamed off toward the lake.

"What'd I tell you?" commented Pete, with a satisfied grin. "An' if we don't ketch 'em to-day I make a big mistake." The Veteran concluded that the best place to set out at would be Middle Point, and this decision proved a wise one, as few birds worked by East Point during the day.

"Hey! you Billy, hurry up with them decoy," shouted Pete to his sturdy offspring, who was coming in the rear with a boat full of wooden treasures. "How you want 'em set?" he continued, addressing the Veteran, for by this time we had reached the point and commenced preparations.

"Put a good bunch well to the leeward," he answered, "and string the rest out in front." With these directions carried into effect, there appeared as tempting a raft of decoys as any duck's eye would wish to fall upon. Our boats lay side by side, well concealed by "blow-guns" and mats of wild celery strewn over the sterns, while we were snugly hidden behind this warm sheltering screen.

"Get in the grass, Pete, quick!" called the Veteran, sharply. "There's a bunch of ducks heading up this way." At his words I looked down the bay where I could see a number of birds circling around in large and small flocks. One of these, a bunch of fifteen or twenty canvasbacks, had separated from the main body and were pointed straight for our decoys, lowering as they drew nearer. "Keep down," said the Veteran, "and let them swing around again before you shoot." Swish went the soft whistle of wings, as the birds passed overhead, still keeping rather high, and I heard Pete give several low coaxing calls in the grass behind us. "Now they're coming," whispered the Veteran. "Get ready," he added, and the ominous click of safeties pushed forward followed. With tense nerves and pounding heart I lay motionless until through the open slits of the screen I saw the noble old ducks, some with set, curved pinions, and others slowly hovering, crowding over the decoys. Then I picked out one of those tempting marks and fired. Rip! bang! spoke the Veteran's right and left at the same instant, and three birds collapsed, striking the water and sending a shower of spray into the air, while I succeeded in knocking over a fourth as he swung by, baffling against the wind.

"There is a tie for you," I said to my companion, as Pete pushed out to retrieve the fallen ducks that were drifting rapidly across the bay before the stiff white-capped breeze.

"Pretty good beginning," he answered, and we both settled down comfortably in our boats ready for the next flock. I have no doubt but that a person looking in on us would have seen a pair of very pleased countenances reclining behind the screens at that moment. Some little time after this I happened to glance over toward the lake, which is divided from the bay by a narrow strip of beach, and saw a long string of birds that I took to be geese winging their way across the sky in a north-westerly direction.

"That is a nice bunch of swan," said the Veteran, answering the question that was on my lips. Stretched out in single file they beat slowly and heavily in the wind, their bodies showing dark against the gray November clouds, for evidently they were all young birds, as we could detect no white ones among the flock. These were the first swan I had ever seen, and the sight gave me a pleasant thrill of delight.

"Mark ahead!" roared Pete suddenly from his place of concealment, where he was keeping a sharp eye on the bay, and simultaneously with that announcement, guns were tightly gripped, and we both slid down in the boats well out of sight. Flying low over the water came a string of ducks, and swinging around to the leeward they sailed up against the wind in fine style. It seemed as if one drake with bowed wings and long graceful neck hung almost over the stern of my boat when I raised to shoot. Then, as four barrels belched out, he crumpled and fell, together with another bird that lay floating on its back, while a third, crippled, swam in the decoys. "Hurry up and shoot that 'crip' over again," the Veteran said, and while I vainly endeavored to load with my fingers all thumbs, he had a fresh cartridge in, and the canvasback's troubles were over.

"We ought to have killed seven or eight," he said, addressing me. "The only trouble was they came in too close, and were scattered so that you couldn't get more than one bird in range at a time."

"My second was a clean miss," I rejoined, "and I had a first rate shot, too."

"I see a duck fall out in der bay," put in Pete at this moment, pushing in the grass within speaking distance. "Mebbe I kin get him; might as well try," he added, and then without warning disappeared from sight in his capacious punt boat, while the Veteran ejaculated, "Mark left! Here's a single duck coming in right over the decoys."

"Give it to him," I whispered breathlessly.

"No, you shoot," he answered, "and hold well ahead."

"He's going like a bullet," I returned, "so be all ready in case I miss."

However, though the ill-fated canvasback received some of the contents of my second barrel, it only seemed to urge him faster, when the Veteran, with a difficult right-hand swing centered him in a charge of shot.

Lunch time at hand, we both did full justice to muskrat sandwiches and a bottle of cider, our appetites sharpened by the sweet, cold, sparkling air. Pete, who had gone after the crippled duck, returned shortly and added another bird to the score.

Once during the afternoon a flock of some fifty canvasbacks swung in to the decoys. I had sat up in the boat to watch a string of geese passing overhead, listening with enjoyment to their wild, weird honks, when a cry of "Mark left!" made me duck quickly and seize my gun. A minute later the air seemed alive with birds—sturdy bodies and long, slim, outstretched necks. Instinctively I managed to single out a pair and killed them with the first barrel, but only succeeded in dusting one with the second, as I did not lead quite enough. The Veteran made two excellent doubles, however, crippling a third that eventually escaped, and we were well satisfied when Pete brought in six plump, heavy silver-backs.

When the ducks were not flying we would lie back comfortably and enjoy the beauty of the clouds. Low in the western horizon they were arranged in long billowy folds, broken by streaks of gold that stretched across from north to south, and through these seams and crevices in the dark blue-black zenith streamed radiating shafts of clear, brilliant sunshine. At intervals it would burst forth in full glory, flooding the gray white-capped bay with light, while a minute later another dark curtain of clouds caused the landscape to assume a stern, sombre aspect. As all good sportsmen know, the pleasures of shooting, whether with

shotgun or rifle, are unlimited. We always have nature and her beauties, for without them we could never thoroughly enjoy shooting in any form. "Count up, Pete," called the Veteran, toward the middle of the afternoon, and then in a minute or so, "How many?" "Forty-two," came back the answer, followed by, "Hey! mark ahead, two duck comin' in." And sure enough, here was a cunning old baldpate, together with a mallard, almost over the decoys. "Now," said the Veteran, in a low voice, and the leading bird collapsed to his right barrel, while I finished off the mallard in the rear.

"Here come a pair of ducks," I said, a short time later, espying two black objects scudding up the bay in our direction. "No fear of those smart old fellows decoying," commented the Veteran, sitting upright, in order to obtain a better lookout. "They seem to be lowering a little, though," he continued.

"Try one when they go over," I urged, and just as the foremost widgeon slid by overhead going like a bullet, and probably sixty yards high, a sharp crack rang out, and with closed wings the duck came whirling down to strike in the grass behind us with a resounding thud! "Good shot," called Pete, displaying a beaming smile, as he plowed through mud and water to pick up the fallen bird, for he was always as appreciative of an exhibition of skill as he was chagrined over a bad shot.

No ducks came our way for a half hour or so, and we were quite contented to sit up in the boat and watch down the bay, where flock after flock of birds, varying in number from a half dozen to several hundred, were continually alighting preparatory to their night's feed. Finally the Veteran perceived a bunch that had come over from the lake nearer to our locality, and as they swung across the beach, their leader, a gray, gnarled canvas-back, swerved in his course and pointed straight for the decoys. Calls in various keys from all of us brought them steadily on, until, with splashes and flying water, three-ducks lit in the midst of the wooden flock, while six others hung uncertainly over them. "Take one in the water," cautioned the Veteran, as we raised up together, and while my first barrel "turned one turtle," I killed a lusty old drake with the second, who was endeavoring to clear himself of danger as soon as possible. Meanwhile the Veteran had been doing lively work, and with four barrels knocked down five ducks, three kills and a pair of cripples, one of the latter outwitting Pete in his effort to retrieve it, while the other after some unavailing maneuvering, succumbed to a load of shot from his trusty fowling piece. Our bag now numbered forty-eight birds, and we had scored even during the day, killing twenty-four ducks each. Most of them were canvasbacks, mixed with a half dozen redheads, baldpates, and the one lone mallard. The sun had lowered until the last long level rays reached out over the bay and marsh with that clear, cold yellow radiance of autumn verging on winter, and so we thought it time to give the birds a rest, for the day had surely been a fruitful one. While Pete and Billy commenced picking up the decoys, the Veteran and I set out on our homeward pull, the sharp squalls sweeping down against us and the keen wind biting our glowing cheeks, as we warmed up at the short stout oars. Once inside the river's mouth, the force of the latter abated somewhat, and after we struck a favorable current, our snug shooting home soon appeared within view, the red glow of the kitchen lamp shining out through the window like a welcoming beacon light. "That's what I call a good day's shoot," I said, while we landed at the dock.

"Yes, and if the weather only keeps cold we ought to have some more as good," returned the Veteran, and let it suffice to say we enjoyed many more in the marsh and on the bay—days that remain fixed as brightly and pleasantly upon our memories as this one. CAMILLA.

## Duck Shooting on Pamlico Sound.

A MESSAGE from my friend Kirk that the day was now appointed for the start on our long talked of duck shooting trip, was no unwelcome news to me. For a long time when we chanced to be together it had been the all-absorbing topic that claimed most of our consideration. Time after time we had gone over the details, and in general feasted on the anticipation of a good trip, where rest, fair shooting, and good fellowship would be the aim of the entire party.

According to my summons I reached Beehaven, Sunday, January 10, and found all the paraphernalia aboard the yacht with everything in readiness, only awaiting my arrival for the start. The party was to consist of W. E. Robertson, Washington, D. C.; Capt. B. C. Kirk, Mr. Underhill, and W. T. Kirk, of Beehaven, myself, and Thomas, the cook.

The anchor up, the big 30 horse-power engine began to push the Gretchen through the water at a ten-knot clip. Soon we were passing familiar landmarks and harbors, with our bow pointing S.S.E. for Ocracoke Inlet, a distance of about fifty-five miles. Soon the town was lost sight of, and we were getting just enough roll from up the sound to know we were afloat. We were constantly running close to coot and numerous small ducks, and were sighting geese and brant in the distance. As we neared the eastern side of the sound, long lines of redheads were seen flying low to the horizon on their way down to the broad shallow sand flats near the inlet, where myriads find subsistence and thousands are shot annually. That was our objective point also. With a smooth and comfortable run to our credit the anchor was dropped at 5:15 near the shooting grounds, in a good harbor all safe and sound, with the honk of geese and the constant chuckle of brant and redheads coming to our ears. This was a condition that others might not have appreciated, but to me it possessed a charm of fascination.

Monday morning we were up early and ready for business. Breakfast over, it began to rain and blow from the northeast, an ideal day to kill ducks, but too hard a proposition for any of us. The day wore hard as we remained aboard and watched the long lines of birds swing to and fro over the feeding grounds.

Tuesday opened fair and we were up and "at 'em" early, with about 250 decoys divided in three stands. Robertson on a point, Capt Kirk and Mr. Underhill in a blind, Billie and I to the battery. I taking the first lay, my little Lefever began to speak in a lively manner, and

it was answered in a spirited way by the Parker and Greener guarding the other stands. After the morning the shooting was a little slow until about three o'clock in the afternoon, when the birds began to come in from the outer shoals. Flying high over the marshes on their way to the feeding ground, they would discover the decoys when at an angle of about 72 degrees, and I never dreamed it possible for flesh and feathers to fly so fast as they did coming down. I confess that the pace was too hot, and the flight too rapid, for any of us to wrap our record with a score to be proud of. When darkness sent us aboard we had quite a few ducks, but far more explanations why this one or that bunch were allowed to pass without paying the regulation toll.

Wednesday furnished fair sport only; the birds were very suspicious and wary; yet when night came we had quite a bunch of ducks. Nearing the boat we met the odor of baked redhead, and reaching the cabin we found that Thomas was up to standard and had them prepared to the "queen's taste." After dinner we held a council of war, and decided to change our base to the upper sound the next day. Arriving at Rose Bay Thursday afternoon, we were soon making acquaintance with the fowl in great shape. We found that the birds were not so plentiful, nor by any means so wild. Thursday afternoon and Friday increased the number of our bag to a very satisfactory showing.

We made the start for home Saturday morning with the yacht dressed in plumage from spar to spar, and from the shrouds ducks hung galore. We reached Beehaven about noon, much pleased with the trip. The comfort of the boat, with the complete rig, and the minute knowledge of W. F. Kirk as gunner, made the trip by far the most enjoyable I ever took. F. P. L.

## Can Ducks Smell?

My genial correspondent-friend, Coahoma, takes issue with me on the question as to whether mallards, or any other ducks, for the matter of that, can and do smell—of course I mean when they are alive. Now, while I should hate to see this subject run into a red god, shod-pole, blackened timber, log-jam controversy, yet it is a matter that should be settled once for all, so that hunters with Teutonic blood in their veins may take warning, and deny themselves, when on the duck pass, an indulgence in their favorite Limburger. To make quick work of the question, let the editor be made the judge, and the thousands of FOREST AND STREAM readers around the world act as the jury, and my good friend from the land of the cottonwoods, moccasins, and rattlers assenting to this arrangement, here is my case:

Now, may it please the court and gentlemen of the jury, the defendant in this case, one Coahoma, alleges, first, that it is his impression that the olfactory machinery of a duck is defective and wanting altogether. He makes that allegation on the strength of certain investigations claimed to be along original lines.

Now, your Honor, let him make his pleading more definite and certain; let him come forward into the open, into the free sunlight that is given to us all to enjoy, and state the names of his investigators, and likewise say how they investigated, and give the time and place. I hold, your Honor, that an ex-parte statement of that kind should carry no weight whatsoever with this court and jury, and that it is a mere conclusion. I say again, your Honor, that he must come before you with something besides an impression that a verdict has been rendered by certain investigators; impressions are not evidence. If he intends to plead *res adjudicata* or *stare decisis*, let him produce the record. I would ask, were the ducks wild or tame? And how was the investigation made? Did they mix in categorical and synchronous order asafetida, hydrochloric acid, concentrated ammonia and tincture of garlic (*purissima*) with boiled corn, and have the ducks eat it in the presence of reliable witnesses with a combination of quacks and relish? Was a memorandum made at the time that the ducks did eat the aforesaid meal with gusto, and has it been preserved? Is there anything to show that Limburger cheese was mixed with their food and greedily partaken of? No, your Honor, no such requisite allegations are made in the support of his contention, and I hereby challenge the defendant to produce any records on the subject which have not been tampered with. Ammonia (conc.) and asafetida are strong things by themselves, but—mark you—they are not Limburger by any means.

Now, your Honor, we will pass along to the contention of the defendant that there is a limit to the power of Limburger cheese—like unto the *Mephitis horridus*—to project its scent. Again, may it please the court, we are confronted with the ex-parte statement of the defendant, unsupported by a single fact. I call for facts, your Honor, facts. Where are they? Why are they not forthcoming? Because, your Honor, there are no facts which defendant can set up on this point, any more than there are facts to show how far a *Mephitis horridus* can contaminate the atmosphere, and also the air.

Now, your Honor, as to the last contention of the defendant, in closing my demurrer *ore tenus*, not wishing to impose further upon the good nature and patience of the court, and the honorable members of the jury, who wish to return to business, I must point out that the defendant pleads white collars and white sapling cuttings, but—mark you—how widely he steers clear of red-labeled Limburger tins. Had the tin been white, and had it not been well hidden between the roots of the prairie grass, where it had considerably tried to hide itself from sight and smell—note, your Honor, that I use the word "tried" with due consideration for its meaning and value—there might be some fleeting shadow of a fact to support the statement of the defendant. But collars and saplings have no bearing on this cheese.

Now, your Honor, and gentlemen of the jury, provided the court lets the case go to you and does not dismiss it forthwith, I will produce before you facts relating to that Limburger, and as I look on your intelligent faces, representative of culture, refinement, and prosperity, the latter, no doubt, because of the keen business acumen evidenced plainly by your interest shown thus far in this trial, I can imagine your bringing in but one verdict, a verdict which will be supported on our side by the strongest evidence possible, and on the other merely by the negative conclusions of the defendant, a verdict, I

say, gentlemen of the jury, that alone will be compatible with common sense, to wit, a verdict for the plaintiff.

And I now, therefore, move you, you Honor, that you instruct the jury to bring in a verdict for the plaintiff without leaving their seats.

CHARLES CRISTADORO.

ST. PAUL, Minn.

## The Wild and Woolly Adirondacks.

Editor Forest and Stream:

I sniff entertainment in your correspondent, Mr. George L. Brown, of Essex county, Adirondacks, and in the bear editor, who admits that you cloud is like a camel, or very like a whale.

I have a kind of sympathy for bears. Without knowing much of conditions in the Adirondacks, and having no sheep there, I hope the law-makers of New York will extend a little protection to the black bears of the Adirondacks if the bears need it. I suggest that the Legislature, or the framer of the bill for the protection of the black bear, inquire into the subject fully before abandoning what I believe to be a sensible, humane, and probably a profitable measure.

I suggest further that those really interested in the matter gather all possible statistics as to the number of bears extant in that region; and yet further, that they ascertain the number of sheep, cattle, men, women, and children devoured by the ferocious and woolly little black bears.

I am interested at this distance because I know something of bears, and because I know something of how stories of their depredations travel, like the tales of mad dogs; and further, because twenty years ago I tried to arouse some sympathy for common bears in California.

It is true that Mr. Brown has given figures showing the number of bears killed in Essex county during many years, but why he should assert these figures as proof of the supply of live bears at large is too logical for me. If, for instance, 35 bears were killed in 1902 (for which the slayers received \$10 each in bounty, as well as the sport and the value of skin and carcass), how in Halifax or Essex or Adirondacks does that attest that live bears are still eating sheep and putting farmers out of business in 1904?

Having, during a quarter of a century, seen the annihilation of about every bear within reach of the most zealous hunters in this region, where there has been no bounty to encourage their extermination, I begin to perceive that the West is not wild and woolly, but that Essex county, New York, is so much more hazardous a frontier that there the sheep and bears struggle for supremacy. The glory of the Rocky Mountains and the Sierra Nevadas and of the great Coast Range of the Pacific is transcended by the tourist and tavern-haunted hills of New York and New England! In California we have a bear or two on exhibition as curiosities of an almost extinct animal, while in the land of Bartholdi's statue and wooden nutmegs bears threaten to predominate! *Ohe! Nisi Dominus frustra!*

There is consolation in most afflictions. Aside from the ignoble, speculative point of view taken by sheep men, I beg to observe that in their sentence they may seek salvation. The bear is a nobler and more valuable animal than the sheep. Neither is the bear as destructive as the sheep. Turn a thousand sheep loose in the Adirondacks and if they had intelligence enough to subsist in winter they would eat all the bears and the deer, too, out of house and home.

After all, about all a sheep can do is cry baa-a, let some duffer shear him once or twice, and then relapse into muton of a more or less questionable value. Wool is worth from 10 to 15 cents and a good sheep two or three dollars and thirty cents. If bears are not worth more, alive or dead, sportsmen do not read FOREST AND STREAM, there are no taverns or guides in the Adirondacks, to say nothing of smoky Indians or raw, right-angled log jams. Why in Essex do not the sheep men go in and raise bears? It may be possible, being at so great a distance, that I do not comprehend the situation. Perhaps they are raising them. \$10 per capita besides the skin and carcass would pay better than coyote farming in California and Nevada. If this latter is the case, my suggestions are ill, and I would not deprive Essex farmers of a bounty from a State to which I pay no taxes.

The bear is a long suffering, much maligned quadruped, persecuted to the death by mankind. Scripture hath told many, many generations of us how bears ate up children from the beginning, and unruly infant humanity has been hushed to sleep for nineteen hundred years with stories of hungry bears. About every mighty hunter that ever killed one of the furry creatures has been an exaggerator of facts as to ferocity, weights and measurement for the remainder of his life. It has been alleged that fishermen sometimes lie. If you know of one having undue confidence in his ability introduce to him an amateur bear slayer and watch him dwindle.

The bear is the noblest American quadruped. He is almost a biped, and he can walk upright with his face to heaven. He is almost as near like man as the monkey. He is intelligent, fearless and powerful, but he has the sagacity to avoid mankind because he knows man has the advantage with his villainous gunpowder and missiles. He is not, like man, a tool using animal, but in his other attributes, he is more than a match for the invaders of his domain. He is a central and prominent figure on the great seal of the State of California, and the order of the Native Sons of the Golden West (who are hard games—I mean hard to beat, generally and collectively), decorate themselves with bear badges and they keep a few pet bears for parades. But there are at this time few bears in this wild State—that is to say, in their wild state. They have been slain by every human device that civilization has invented. There are miles square of wastes and uninhabited mountains in California where bears once subsisted but where a bear track could not be found by Leatherstocking himself.

The last bear track I saw in the miles of mountains in this region was being followed by three Indians. Three of the last of the Indians following about the last bear. An old man with tottering legs, a younger man, and a boy about fifteen years of age. The old man wore portions of a broadcloth coat—descended to him by slow, successive gradation—that is to say, degradation, and he

wore tattered cotton overalls, and was barefoot. The boy was barefoot also, without a coat, and he was half white. The other man had some clothing on also, for it was winter and there was snow. They had an old smooth-bore musket or "yager," and had followed the bear track for three days. They had wounded, but did not get the bear. This was several years ago. Two of the Indians are dead. The bear is not known to have made any more tracks.

The foregoing testimony merely goes to show that "Westward the course of empire takes its way," leaving Greece, Athens, Rome, and Essex county, New York, relapsing into primal isolation and solitude. With all respect to Mr. Brown and Essex shepherds, however, I would observe that I should prefer a flock of black bears to a flock of sheep. There might not be so much wool at shearing time, but think of the bounty, Mr. Brown, and the bear meat and bacon, and the splendid overcoats and robes—think of these—and let them raise sheep in Wyoming and Australia and in Spain.

This is a queer world. Our Government pays a bounty on sugar and all of us want to propagate beets and cane. The State offers a bounty on bears, and a correspondent of FOREST AND STREAM advocates their extermination, while the editor rather sanctions the idea. Alas, also, that in New England and New York they want to hound deer, invade private domain, and kill bears "law or no law" if it interferes with "home rule"—Gee-whillikens! In the utmost West by the sundown sea we have the reputation of being rather lax in loyalty to law and order, but the Bluenoses and Knickerbockers—Ah, me!

RANSACKER.

SHASTA MOUNTAINS, Cal., February.

## The Grouse.

Editor Forest and Stream:

As we are all anxious to preserve the ruffed grouse, perhaps it might be well to obtain the testimony of men of the woods as to the relations between hawks and this noble bird. Personally, I have never seen a hawk engaged in the capture of grouse, young or old, but have often caught hawks in the pursuit of smaller birds, like bluejays. When the latter are escorting their broods of young through the oaks in the fall, they are often followed from tree to tree by a marauder, who, when hungry, will easily capture a blue coat, whereupon a great scolding and squealing will ensue for a while, but eventually all will quiet down. As the days pass the little flock dwindles to a few shy ones, and brother hawk and family have fared sumptuously.

As long as the jays last the half-grown grouse will be let alone, but after the former are scattered and gone, something like a brown knot will be observed on the limbs overhanging the dusting places, and that fine brood that you have been coaxing along with sundry sly feedings of grain will begin to decrease about one bird a day. Of course, it is weasels or foxes at night, and you keep wondering. There are no snares, nor are guns heard up on the flat on the old mountainside where the two wood roads diverge. With an Indian's patience your amateur naturalist keeps haunting the locality on the sharp lookout for vermin. Along about nightfall little rustlings in the bushes and low cries tell of a movement toward the feeding grounds at the mountain base among the blackberry vines. A brave old hen proudly leads a covey of six short tails across the steep log road just below two rather large pines. The trees stand just over the dusting places. Well, they are safe to-day, for it is getting too dark for hawks, as they know very well. The watcher decides to return to the farmhouse one hundred yards distant, and steps from his screen of leaves. Like a dart a big object shoots down the path from the pine tree, and instinctively the brown barrels swing down to the course, and a little below. A heavy thud is the result, and the game keeper lifts a big hawk, his eyes glowing with fury on his avenging captor.

As far as the baldhead eagle is concerned, I have never seen one after anything but fish, although I have lived on the shore of a lake where grouse were plentiful.

It is well known that crows destroy the upland corn planting, pulling the tender shoots and eating the seed, and I have seen them carry off dead chipmunks and squirrels that had been killed and thrown away. I know that the larger owls eat young crows, for I have found their feathers and bones around and in the nests of the great horned owl early in the spring before leaf time. Once I heard an owl hoot near a pond at midnight. Suddenly a crow gave a wild note of alarm, and the hooting ceased. An Indian once told me that the owl hoots to make his prey move uneasily, and thus betray its whereabouts. There is no love lost between crows and owls, and the former even things up by day.

About the scarcity of grouse, up in Ticonderoga on the hill there was not a bird last summer, where one could have found twenty the year before. A few coveys were seen—nice birds—around the farms, and there was much drumming on the hills back of Eagle Lake, but, to use a local expression, "they didn't come down at all," and I only saw three or four scattering old birds in the most likely places along the lake road where I lived during the summer. One solitary covey of four little fellows was treed by a yellow dog one night and one was carried home. It is my belief that hundreds of nests were destroyed by the ravaging forest fires in the back country, which killed and scattered the birds in the fire-swept districts. Then, too, the entire Adirondack region was covered with a dense pall of smoke for days at a time, and this must have been pretty hard for the young birds, which had been half frozen to death with the cold just previous.

There was a terrible mortality among the beautiful pike of the lake, and scores of big fellows were floating about the lake. Some guides believed this was caused by the almost total lack of rain and the consequent stagnation of the water in the still, swampy parts where the fish lived.

One thing is sure, there were almost no young birds raised up Essex county way this season.

Once when a boy I observed two birds fighting; one, a large bluejay, was being worsted by a smaller chap, who kept hitting him vicious blows on the head, when he would retire to his "corner" for another round. As it

was going to be a knock out for the big 'un pretty soon, I just fired and picked up a nice little hawk, one of the smallest I ever saw.

A friend of mine killed a large hawk last season, and upon examination found in his talons a still living yellow hammer. The hunter had the bird of prey and its captive mounted by a taxidermist.

An old hunter up in the Adirondacks who had nothing to do last season but nurse a lame leg, told me that he had a dozen of the nicest chickens I ever saw out there by the woodshed, and that some crows came and stole them one by one, in spite of all he could do. He spoke with some feeling on the subject.

PETER FLINT.

## Shooting a Scotch Grouse Moor.

DAWN in the Grampian Hills. Long shafts of sunlight change the color of the heather-clad braes and corries from the cold gray of the night to the warm royal purple of the heather bloom. The Watcher is astir early with his stick and spyglass, he is wandering about on the high ground on the lookout for poachers. The "Guns" are in dreamland. All at once the strains of the pipes are heard near the castle. The lazy Guns awake, and, jumping into sweaters and tennis flannels, meet in the smoke room, a sleepy lot. A quarter of a mile run to the bathing pool wakes them up a bit. The bathing pool is a basin worn out of a huge rock by a little trout stream that comes down from a patch of last winter's snow away up on one of the ptarmigan tops. A plunge in the pool, a second or two under the waterfall, and then back to breakfast. Breakfast over, the next business of the morning is to cut luncheon. Cold grouse and graham bread are laid out on the sideboard, and every Gun must prepare his own sandwiches. After this a delay is likely to occur while an important letter is written, a lost flask found, shooting leggins changed or something, and remembering that these sportsmen have not risen with the Watcher, and the sun is fast getting high, one is inclined to get impatient. Between half-past nine and ten all is ready; the party is comfortably seated in the wagonette, the word is given to start, and we are off for half an hour's drive to the place which has been selected as the beat we will shoot. At last the wagonette draws up before a tiny shepherd's hut, the party gets out, is respectfully greeted by the dogs and gillies awaiting them, and preparations are made for getting to work. Guns are sorted out, pockets stuffed with cartridges, and the line formed.

"Captain Blank," says our host, "as our most honored guest, will please take the left of the line?" Captain Blank accordingly shoots the left all day, and has the freedom of swinging around to his left with no danger of shooting a companion. The other man takes the right. In the center comes Kennedy, while Duke, Bingo or Romp go ahead. Almost out of sight in the rear, and theoretically out of range, comes the rest of the party. The pony bearing the two baskets or paniers, one for the luncheon and the other for dead game, the pony boy to lead the pony across the unbroken moorland, and one of the under keepers with the rest of the dogs in couples. "Ho-up." The keeper throws his arm up. Duke is on a point. The party halts for a second to get bearings, and then moves slowly forward. Whirr! The covey takes wing, guns are discharged, and possibly three birds are down. It is necessary to load quickly for there may be more and an old cock is shouting, "Go-back, Go-back, Go-back" from a rock ahead, which may be a simple remonstrance or a signal to the rest of his brood. Whirr! Hold hard—"cheepers"—and we hold our fire, for cheepers are not full grown birds, and too young to shoot. The game that is down is found and carried in the keeper's hand, a head between each two fingers, and we go forward. In a few minutes Duke is pointing again, but we only get one bird, and the rest are marked down across the valley to be picked up on our way home. We spread out and go forward, and Captain Blank walks into an old cock and brings him down with his second barrel. We work along through the purple heather with never a tree in sight, up hill and down into little valleys, across clear mountain streams, and through brown peaty ones flowing in small cañons which they have worn for themselves in the black sticky loam of the moors. The keeper's hands are full of birds, and he raises them above his head in signal to the "pony" that he is about to leave them on a prominent rock to be gathered up as the rear party comes along. At length it is time to think of the sandwiches we have prepared. "Where is there a good well?" says our host to the keeper in Gaelic. "Just over by that sheep," he responds, pointing to a flock of a dozen or more, and turning towards the rear party he puts his fingers to his lips and gives a shrill whistle, at the same time waving his handkerchief to bring them forward. The keeper now leads us to a cold spring bubbling out of the hillside, and when the pony comes up ulsters and mackintoshes are flung upon the heather and we throw ourselves down as upon a springy bed. Before the packets of luncheon are opened, Captain Blank calls out, "What's the bag, keeper?" "Eleven and a half brace, sir, and a hare," is the reply.

"That's not doing very well," says the Captain, "but we should do better after lunch," and then we fall on the food. After food comes smoke, and we have been halted about three-quarters of an hour when our host gets to his feet. The alert keepers who have eaten their luncheon according to British etiquette, thirty yards in the rear, spring to their feet and the formation is again taken up, the rest of the beat covered; birds found plentiful late in the evening on our return to the flat, and the total bag reaches twenty-six and a half brace and three hares before we get to the castle; not a wonderful bag, but the moor is not doing so well this season as last, the first hatching were killed by the late frost, and the second hatching by early wet weather, and so forth, we are told, and besides it is getting late in the season, the frequent rains have made the birds wild and strong on the wing, but notwithstanding all these disadvantages the day has been a most enjoyable one; a small bag over dogs seems decidedly preferable to a larger bag made with driven birds.

STORLAX.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

## Belgian Firearms.

LIEGE, Belgium, Oct. 5, 1903.—The firearms industry remains in a satisfactory condition, and while the prices for center-fire arms has decreased a trifle, as is also the case with hand-made and interchangeable machine guns, the trade in the better grade of guns, such as the fine fowling gun, is in a very flourishing condition, and never before has this gun, as manufactured in Liege, been in such universal demand.

Trade in revolvers, which for a time had been a little off, is again picking up. The same may be said for the single-barreled guns, made cheap for export to the coast of Africa.

The markets of South America seem to be in a better condition, and several important orders have come from Brazil and the Argentine Republic.

The manufacture of firearms, complete or in part, is the traditional industry of this Province. Whether the people of Liege hold the secret of turning out a prime quality of gun barrel or other integral part of the arm, I do not know, but it is an established fact that no other barrel of corresponding make and value can stand the strain of the severe test put upon it as well as the Liege gun barrel. Every barrel must, under the law, successfully withstand the Government test before it is admitted for sale. The gun barrels are made by the workmen in their own homes, and are delivered to the merchants, who combine the parts for the markets. It is said that no less than 50,000 men, women, and children are engaged in the manufacture of gun barrels. This system of buying from the people lessens the responsibility of the manufacturer, for if the barrel fails to withstand the test the workman and not the manufacturer is the loser. The material for manufacturing the gun barrels or other parts of firearms is oftentimes supplied by the manufacturer, who sometimes gets his barrels roughly made and completes them himself.

It is the universal understanding here that the United States is the best market for the cheap grade of guns, and there is a double-barreled gun called at Liege the "American."

It is estimated that in the Province of Liege about 150,000 pairs of gun barrels were manufactured during the year 1902, part of which were sent to the United States rough bored, to be finished there. The exportation of gun barrels of all grades to the United States is increasing.

Quite a controversy is on here as to the better quality of gun barrel—the Damascus or the steel. The Damascus is manufactured only at Nessonvaux, near Liege, while the steel barrel is made in Liege. One argument in favor of the Damascus barrel is that in case of an explosion there is less liability of injury than with the steel barrel. Muzzleloading guns are sent in large quantities to South America, while the flintlock is made for export to Africa.

The rifle barrel manufactured here is not exported to the United States in great quantities, on account of the duty thereon.

Revolvers are turned out in great numbers, and are shipped to all parts of the world. It is estimated that 600,000 were manufactured in Liege last year.

During the six months ended August 31, 1903, there were exported to the United States firearms to the value of \$234,815.71, and gun barrels to the value of \$39,012.33.

JAMES C. McNALLY, Consul.

## Wolves and Forest Reserves.

NEW YORK, Feb. 13.—Editor Forest and Stream: I have read a letter published in the last number of FOREST AND STREAM concerning "Wyoming Wolves and the Forest Reserve," in which it is stated that "There is no doubt but the reserve will become a breeding place for wolves, coyotes, and cougars, thus leading to greater friction between the reserve and the stockmen."

There is no reason why animals of this kind should increase in consequence of these mountains having been taken within the Yellowstone Forest Reserve.

Since the creation of this reserve no change has been made in conditions that would tend in any way to this result. There has been no decrease in the number of settlers, or diminution in the amount of stock ranged upon the reserve; the same game laws exist there as in any other portion of the State, and are most efficiently enforced by the forest rangers, who are also State game wardens. Hunters and trappers desiring to capture mountain lion, wolves, or coyotes, are in no way interfered with, but, on the contrary, have every facility and opportunity for the capture of these animals upon the reserve as elsewhere. The State bounty paid on wolves applies equally to those killed on the reserve as off the reserve.

The reserve officials recognize that mountain lions and wolves are a great menace, not only to game, but to the stock of the settlers, and the rangers, armed, and constantly patrolling the reserve, are instructed to destroy at every opportunity varmints of this kind. A number of wolves have already been killed by the rangers.

A pack of dogs is now being raised for the purpose of hunting mountain lions upon the reserve.

Many reports, without foundation, have been circulated regarding this, as well as other conditions connected with the forest reserve, with intention of stirring up opposition to the reserve. An article published in a Wyoming paper last year stated that a trapper named Lyons, going upon the reserve to hunt wolves, had been disarmed by a ranger. The department now has an affidavit both from the ranger and from Mr. Henry Lyons, stating that the report was absolutely false.

Thus you see a desire to create a prejudice against forest reserves on this point is entirely unwarranted.

Settlers in our State, realizing the necessity of timber and water protection, and also realizing that the reserve was created and is being administered for their benefit, not only is all opposition disappearing, but they are rendering most valuable aid in assisting the forestry officers in carrying out the rules and regulations of the department.

A. A. ANDERSON,

Special Superintendent Yellowstone Forest Reserve.

## Farmer, Hunter and Trapper.

HERESA, N. Y.—In a recent communication I mentioned a boyhood companion of mine of whom I proposed to have more to say later on.

Mr. Barney Sheley, an old time hunter and trapper, has resided on Red Lake (near where I have passed two of the four months of my vacation this season) for nearly thirty years, during which time he has cleared and is now tilling about fifty acres of a farm of more than three times that number. For many years before and since Mr. Sheley took up the occupation of farming he was a hunter and trapper in the northern wilds of Canada. Mr. Sheley has captured many beaver, otter, fisher, marten, mink, bear, and all other fur-bearing animals of that region; and more deer than I would like to mention in this article, which, according to his figures (I don't doubt them), are more, I think, than any man should kill in a lifetime. But in those days it was business not sentiment with Mr. Sheley.

Although there has been no deer shot in this vicinity of late years, Mr. Sheley manages some way to get a deer skin nearly every year. Within the past month I have seen him "smoke tan" a deer skin, cut and make complete as good a pair of buckskin mittens as can be bought in any store. Mr. Sheley told me that he could make four pairs of mittens from one skin, which he and his two stalwart sons make good use of during the cold winter. Mr. Sheley keeps a flock of about fifty sheep, which run in the woods from late in the spring until the crops and grass are gathered from the fields. He also keeps from six to eight Jersey cows; the milk is in great demand by campers on the lake, and Mr. Sheley's estim-

never had to ask this farmer after that for permission to hunt on his land; his trespass notices did not apply to me.

CABIA BLANCO.

## Eastern Long Island Ducks.

ORIENT POINT, Suffolk County, N. Y.—*Editor Forest and Stream:* You are aware of the fact that Long Island gunners were, and are, deeply aggrieved over the passage of the Brown duck bill last winter. There are so many conditions which differ so widely in different localities that it is impossible to frame a law which will meet the requirements of every portion of this or any other State.

In this locality only salt water ducks (with rare exceptions) visit our waters. They are coots, old squaws, sheldrakes and broadbills, and are known by many as "trash ducks." My experience covers fifty years with a gun, and I have never had the opportunity to kill a mallard, canvasback, or redhead, and I have never known of a dozen redheads or mallards being killed in this locality by all the gunners I have ever met. We have always had a few black ducks, and we have them yet, and very few of them are killed. It is a rare thing for a man to kill fifteen or twenty during a season. It is a rare thing, too, for any one man hereabouts to kill 100 ducks in a season, and they are nearly all coots and old squaws. We shooters of the east end are perfectly willing for our brethren of other parts of the State to make whatever laws they deem best for the preservation of the various kinds of game in their localities. It seems to me that this view of the matter is perfectly fair all around. I do not wish to see the ducks all slaughtered, either by myself or others, and suggest a reasonable bag limit for ducks,

## The Birds and the Winter.

OWEGO, N. Y., Feb. 8.—The extreme cold weather of the present winter has played havoc with game birds of all descriptions in this locality. Quail are dying by the flock, and partridges are having a hard time of it, but being so much more hardy than the quail are not dying in such large numbers.

A few days ago a farmer from one of the outlying districts reported that he found a flock of twenty-two quail under a stump fence on his farm, fifteen of which were dead; he took the remaining seven to his house and attempted to save them, but they were so far gone that all died. Another farmer reported that he found a flock of twelve quail under a fence by the side of the road, all dead. These are only two of numerous instances where whole flocks of quail have been exterminated in this county by the extreme severity of the winter.

Local sportsmen are about to organize a sportsmen's club for the purpose of better protection of game and fish and to devise means, in severe seasons like the present, of making arrangements with the farmers to feed the game birds.

## The Cuvier Club.

AFTER making 800 arrests and convicting more than two-thirds of the persons apprehended, the Cuvier Club of Cincinnati, through Alexander Starbuck, president, and W. J. Lawler, secretary, has addressed a communication to the Legislature in session at Columbus, asking for legislation looking to the better protection of fish and game and song and game birds. The Cuvier Club is re-

TRAPPING MUSKRATS ON THE INDIAN RIVER.

THE HOME.

Photos by Harry Hanson.

able wife also produces from it butter that is much sought for by the village folk.

I send with this a photograph of Mr. Sheley's humble but comfortable home; also one showing Mr. Sheley trapping muskrats on Indian River the past spring. There is no neighbor nearer than a mile up the lake, and during the long winters they have but few visitors, who are always kindly welcomed.

J. L. DAVISON.

## Boys' Guns and Forest Fires.

*Editor Forest and Stream:*

Mr. Edmond Redmond, in the FOREST AND STREAM for February 13, makes some sensible remarks about boys handling guns. These small caliber rifles and air guns—the air guns in particular—seem to be a source of dread to some people. The air gun is not at all dangerous, even when you are hit with it, which does not often happen. I have had a buckshot fired out of one of them hit me more than once, when the boy handling it was careless with it; and I did not have to hunt up a surgeon on account of being hit. The chief of police here was given orders last fall to gather in every small gun he found in possession of a boy on the street. He found none; they all suddenly disappeared off the streets in town.

Those Flobert rifles are not half so dangerous in a boy's or anyone else's hands, as are the toy pistols that no one seems to notice. A boy when he first gets a gun needs to be told how to use it. If we who know how it should be handled take the trouble to tell him (I always do), in a short time he will get to be careful enough not to shoot himself nor anyone else. And, as Mr. Redmond says, if a boy is never allowed to have a gun, how is he going to learn to use one? The best shots and the best soldiers I ever met in the army were country boys who had been carrying a gun of some kind ever since they had been old enough to lift one.

These forest fires, nine times out of ten, can be traced, if anyone takes the trouble to trace them, to a spark (a single spark often starts one, too), that has been thrown out of the funnel of a locomotive. The spark need not drop on dry grass or leaves to start a fire. It is a fact that I have seen a spark fall on green grass here where a railroad passes through a park, and have seen the fire start while I stood looking at it; this in the middle of summer when there was no dry grass here.

Some years ago I saved a farmer's whole crop of hay for him by being just where I happened to be when the fire started. A spark from an engine set fire to the dry stubble in his meadow, and I got the last of the fire put out when it was within ten feet of his hay stacks. The farmer only got there after the whole affair was over. I

quail, and rabbits, with an extension of time for the former in this (Suffolk) county. The ducks cannot all be killed, nor half of them (which visit us), but if the shooting is overdone the birds will vacate this locality for some other where they may feed undisturbed, and we, of course, must suffer the consequences, and others, perhaps, will be the gainers.

UNCLE DAN.

## New York Sportsmen's Show.

THE tenth annual Sportsmen's Show opened at Madison Square Garden, this city, on Friday evening. A large artificial lake running from one end of the garden to the other is utilized for the display of high power launches and automobile boats; and there are here, afternoon and evening, canoe races, tilting contests, log rolling, and other aquatic competitions. The Rocky Mountain guides occupy a space at the western end of the lake, and about the main floor are camps and guides from Virginia, Colorado, Wyoming, Idaho, Maine, the Adirondacks, the Hudson Bay Company's territory, and the Canadian Pacific Railway. There are exhibits of live game birds and animals, among the exhibitors being the New York Zoological Society. A model fish hatchery shows the development of young trout from the egg to the growth of three or four weeks.

Fly-casters enjoy greater opportunities than at any other past show. A special tank has been constructed for this feature, and the rules for the competitions, in the hands of the fly-casting committee, which have recently been printed, are such that there will be an added degree of interest to this part of the programme.

## In North Dakota.

GALESBURG, N. D., Feb. 12.—Herewith I send you my subscription to FOREST AND STREAM, as I have done for these many years, and were I able to afford it, ten times the sum would not pay for the pleasure and information I have yearly gleaned from your fascinating pages ever since the old ROD AND GUN and FOREST AND STREAM joined hands, and the question, "Do quail withhold their scent?" and similar ones were the burning ones of the day. By the way, there are three coveys of quail near this town now, last fall being the first time I ever saw any here in a residence of over twenty years. I have been buying some fur this winter. Mink and foxes are quite plenty. Game birds are coming through well, the numerous cornfields about being a great help to them. I find the community has a rapidly growing sentiment in favor of preserving their game, and several farms are posted and closely watched against shooters.

Jos. P. W.

garded as one of the most useful of the many philanthropic institutions in Cincinnati, and the determined action which it has taken in the matter of protecting fish, animals, and birds has been the source of much favorable comment.

## Are Frogs Poultry or Insects?

A BOSTON correspondent of the New York Evening Post writes: The decision of Secretary Shaw that frogs' legs are dressed poultry, upon which you have an editorial in the Evening Post of February 9, finds a parallel in the following story:

Two gentlemen, one of whom had with him a dog, were once riding together in the compartment of an English railway carriage. The guard demanded a ticket for the dog, asserting that the rules of the railway required it. The discussion over the matter having become somewhat animated, the other passenger produced a turtle from his pocket and asked the guard in a tone of sarcasm if he would not require a fare to be paid for that animal as well. The guard answered that he would inquire and report later.

Soon after he came back to the carriage and delivered himself of the following:

"Cats is dogs, and rabbits is dogs, but 'tortoyses' is frogs, and frogs is hinsects, and they rides free."

## Game in South Carolina.

GEORGETOWN, S. C., Feb. 7.—Game has been in great abundance this winter. I have never seen the like of ducks and deer. Mr. Cleveland was in camp for a week on General E. P. Alexander's preserves, and had fine sport.

W. M. H.

## 100 Sportsmen's Finds.

Some of the Queer Discoveries Made by Those Who Are Looking for Game or Fish.

94

IN the year 1809 a Kentucky hunter named Hutchins wounded a bear in the forest, and as the bear ran off he followed it rapidly. Imagine his surprise when the game led him into an immense cavern many miles long and grand beyond description. The cavern is now known as the Mammoth Cave, and is the largest in the world.

CLARENCE VANDIVER.

# SEA AND RIVER FISHING

## Tarpon and Woodcock in Old Mexico.

WE left New York about December 1, for Tampico, Mexico, and after four days at sea we made Nassau, one of the Bahama Islands, an English possession. There are two very large hotels there, that were not open, as it was too early in the season. As near as I could judge, about 99 per cent. of the population was negroes. The sea water there is noted for its clearness and most beautiful colors. The sea gardens are one of the attractions of the place, the bottom, which is plainly seen from the boat, consists of a growth of all sorts, shapes and sizes of sea plants, with fish swimming around, all sizes and colors. But alas! they tell me there, these fish don't bite; in fact, they say the fish are so smart there, that they can tell you how much you paid for your hooks.

After a day's stay at Nassau we headed west, for Mexico, and after steaming four days across the gulf, arrived at the mouth of the Panuco River. Entering we went up seven miles to the city of Tampico, landing at the new four million dollar Custom House where, after a hurried look at our baggage, we went ashore with a string of natives carrying our baggage up to the Plaza, where Mr. Kulka had the carriage to take us to the ranch, about two miles out of the city, on the banks of the Tamise River, a branch of the Panuco River.

As I had promised the purser and chief engineer to take them up to the big flat the next day, duck shooting, I unpacked in the afternoon and got out shells and gun. I joined the men the next morning at five o'clock, and after a most delightful day, we got back to the ranch with thirty-five ducks—canvasback, spoon-bill, sprigtail, bluebill, gray duck and teal. Besides, the chief shot a large sacred ibis, and we got a lot of white ibis, roseate spoonbill, curlew, etc. The chief's arm was black from shooting a borrowed gun, which he must have held loosely.

Now, as far as ducks are concerned, there are always plenty of them there each winter, but Mr. Kulka asked me, "Do you like woodcock shooting?" I said "Yes, but there are no woodcock here." He said, "I will show you hundreds to-morrow." Now I had been going to Mexico for nearly ten years, each winter, and never saw a woodcock, so of course I was skeptical. The next morning Mr. Kulka took me to a marshy place at the foot of the bluff, right on the ranch, not 200 yards from the house, and as I reached the edge, one jumped up which I killed nicely. On picking it up I found a nice, large woodcock. I plunged into the marsh—sometimes it was over my knees—and they began jumping right and left. I missed a great many more than I hit. I found it was a different thing from shooting ducks, I also found they had a habit of getting a tree between myself and them. After shooting twenty-five shells I stopped and found I had eight birds. I found that for miles on the edge of all the lagoons, there were hundreds of woodcock, and the reason I had never seen them before was that I never went into the marshes, as I never thought of looking for them. A man that can hit them every time, could bag 200 in a day there. I did not have any small shot shells, so did not get the practice I would have liked on them; and it don't pay to buy black powder shells at Tampico, at ten dollars a hundred, which is five dollars gold. The best way is to take all the shells needed with you. There are also lots of English snipe there, but I did not shoot any of them. Woodcock was good enough for me.

The next day a party of us made a trip to the big flat, for ducks. One of the party being Mrs. George Monell, who is an inveterate sportswoman, with both rod and gun, and also a first-class wing shot. She shoots a light 20-bore double gun. Our party killed twenty ducks, and we stopped shooting as we knew Mr. Kulka could not use any more. Mrs. Monell was high gun, having killed eight. This shooting was done by each taking a stand on a point and killing them as they wizzed past.

As it was still early we voted to catch a lot of fish for the house. So after killing a few blackbirds, and using their entrails in lieu of worms, in a short time we landed twenty-four sunfish, weighing about a pound each. I happened to have a phantom minnow with me, that I had used at the Delaware Water Gap last summer, and caught three nice bass with it there. I made it fast to Mrs. Monell's line, she started trolling on the road home. In a short time she had a strike, hooked, and after an exciting time and lots of advice from us all, she brought to the side of the canoe a fish that we judged weighed about twelve pounds, that looked like a cross between a pike and a striped bass. The natives called it by some Spanish name, and said it was good eating. She tried again and hooked; and after a short fight, landed a jack fish we judged to be about eight pounds in weight. Her next fish was a mullet, about five pounds. We were all wishing for a lot of phantom minnows. Altogether, she landed about fifteen fish with that one second-hand minnow, and as she had lost two sets of the gang hooks, and the only one left was broken, and the minnow looked as if it had been in a

cyclone, she gave it up as played out. The next time I go there I will have a nice lot of these phantom minnows. I would have given quite a sum for one after I saw what they would do there, but you can't buy anything of that kind there.

I had a new tarpon rig with me, and Mrs. Monell also had one, and neither of us had ever caught a tarpon. Mrs. Monell's rig was a Shipley rod, 200 yards, 18 linen line, plain reel, fitted with a thumb brake. My rod was a Shipley, with agate tip. I used a 21 line, thumb brake on reel. All the people told us we were too early for tarpon, as there would be no tarpon fishing until February and March. I talked with a man there, who said I might get a strike at the mouth of the Tamise River where it empties into the Panuco River. So after engaging a native to get me mullet for bait for the next day, Mrs. Monell and myself left in a native canoe, about 20 feet long. We instructed the boatman to call at the native's house on the banks of the river for the bait, and when we arrived there the native had a string of about a dozen mullet, that weighed from two pounds to five each. Of course, we were disappointed, but the native naturally thought he was giving us good measure, although I had distinctly told him I wanted fish only four to six inches long. Possibly my Spanish was as defective as his bait.

As we had started we concluded to go across the river, and try at the mouth of the stream they called Pueblo Vehocho, as it was near, and we both trolled one line on each side of the canoe, with the agreement that if one got a strike, the other should reel in quickly, and we had the consolation of knowing that if we did not catch anything that we already had a string of nice eating fish. As it was our first experience with big fish, it was amusing when Mrs. Monell's hook got caught on some sunken log and she thought she had a big one for sure, as it took line until the canoe stopped. After getting under way again, she got a strike by a big fish of some kind, but he did not act as tarpon do. He was a big, slow fighter, but very strong. I reeled in at once. The native boatman wanted to help the angler, but she would not let him touch her line, and after an exciting ten minutes the fish got loose, and we never even got a look at him. Mrs. Monell was almost ready to cry, but I told her that there was just as good fish in the river as the one she lost.

A short time after I got fast to what I thought was the bottom of the river, but it turned out to be a big 150-pound fish, a slow, heavy fighter. The native called him a charra; the Americans call him a jewfish. After Mrs. Monell shot him five times with a .22 cal. rifle, I got the gaff in him, and as he wiggled he turned the head of the gaff on the screw; but after a lot of exciting work, we got him into the boat. I had been a little over an hour landing him. Then we concluded to go home.

Then we told our troubles about the bait to Mr. Kulka. He promised the next time we wanted to go out he would guarantee to get us the kind of bait we wanted, and it was arranged to go December 28. Mrs. Monell, whose fighting blood was up now, declared she would catch a big fish if it took all winter.

True to his word, Mr. Kulka had a native bring us over a dozen mullet of the most inviting size, from four to six inches long. We concluded to try up at the mouth of the Tamise River, about which the American had told me. Mrs. Kulka packed us a nice lunch, and with several orders and admonitions as to what to do if we hooked a tarpon, we got under way at six o'clock in the morning, shortly after sunrise, and it was one of the most beautiful mornings I ever saw, just cool enough to be pleasant. The ducks offered us some splendid shots as they hurried up and down the river; they seemed to have no fear of us, as if they knew we were not after ducks that morning.

After we got into the Panuco River two large turtles with heads almost as large as ours stuck their heads up, took a look at us, then sank quietly below the surface. We agreed to take turns trolling, and only have one line out at a time. Mrs. Monell was to try for first strike. After we reached the mouth of the river we could see a few tarpon turning, and Mrs. Monell's line was not out five minutes when she got a strike by a big tarpon. He jumped fully ten feet in the air, then spat out bait and hook fully twenty feet; it all came so suddenly that I suggested that if these fish are not handled just right they will cause trouble, as they are so large. Mrs. Monell now insisted that I try for one, so that she could see how I handled him. I had read up a whole lot on how to act, and on the road up Mrs. Monell and I had talked this over. I had read of some who advocated giving the fish line as soon as he struck; others claimed it was best to strike hard the minute you felt the fish.

I made up my mind that I would strike hard; so I put out a nice bait, and we had not been going ten minutes when I got a strike. I struck back until my pole was almost in a circle, then let him have his run; he broke water and then sulked. I got the boat near him, when away he went; I made him tow the boat; he jumped about twelve feet in the air and came down, nearly drowning us with the splash. After a fight of an hour and a half I got him alongside and Mrs. Monell shot him through the spine; I gaffed him and hauled him

out on the bank. He measured 6 feet 4 inches, and was the longest one we caught. I passed a rope through his gills, and tied him to a tree and left him there, and we could see his beautiful silver side shining way across the river.

I now put a nice bait on Mrs. Monell's hook. I passed the hook in the mouth of the mullet, then turned it, bringing the point of hook out through the top of the head. She had not let out over fifty feet of line when she got her strike, and she struck for all the pole would stand. The fish jumped out of water, then dove and sulked, then took out nearly 100 yards of line, then, as she reeled in on him, he sulked. On account of her having her back to him she did not see the fish when he jumped, and she said: "I think it is not a tarpon; I think it is a jewfish." I assured her it was a tarpon. "Well," she said, "I would love to see him." The boat then was nearly over him, and it would almost appear that he heard her request, for he came up with a rush and jumped high out of water, and as he struck alongside the boat we got our second wetting. She said, "Now I am satisfied." Although he was the smallest fish we caught, 5 feet 4 inches, yet he jumped out of water five times, and it took Mrs. Monell an hour and fifty minutes of good hard work to land him. As we were landing him on the opposite side of the river from where we left my big one, we happened to look across the river, where we saw a flock of turkey buzzards all over my fish. We got over as quickly as possible, and drove them off. They had not hurt it.

Mrs. Monell just laughed and cried when I gaffed and pulled her fish out of the wet. She said: "This is the greatest sport on earth. Now, just let me try for another." We had only made one turn through the mouth of the river past the stone abutments where the railroad bridge crosses, when she had her second strike, and he was a lively fighter. He jumped about twelve feet out of water, and repeated that six times before she killed him. I wanted her to let me take her pole for a short time to rest her, as I saw he was good for a long fight, but she was game. She would not let the boatman or me touch her line, although she was exhausted. After a little over two hours she brought him up where I put a ball in his spine. I then gaffed him and pulled him out on the bank of the river.

Quite a crowd of natives had been watching the fight, and they flocked around and examined that little 18 linen line, and seemed to think it was wonderful. This last fish measured 6 feet.

Mrs. Monell was now exhausted, and I said I would hook one more and then start for home. I cast off, and on the second turn around the mouth of the river I got a strike, and drove the hook into him for all the rig would stand. He made a flying leap, and Mrs. Monell said, "He is the biggest fish of the lot, don't lose him." He seemed to want to go down the river our way, so I made him tow the boat for over a mile. Then he sulked, but I kept him working, as I wanted to get home, and I did not really care much whether I lost him or not; so I put as much strain as possible on him, and after an hour and a quarter Mrs. Monell shot him, and I, wanting to end it, jumped out of the boat on the bank with the pole and told the boatman to throw me the gaff. I then dropped the pole and took the line to pull him in, when he suddenly took a new lease of life, and started for the middle of the river. I sincerely wished at that time that I was back in the boat. I quickly grabbed the pole and put the break on him hard as I could. After taking about 150 yards of line, he slowed up, then stopped. I reeled him in close, then dropped the pole again, took a turn around my wrist with the line, and pulled him into three feet of water, then ran in with the gaff and quickly had him on the bank, but I will never try that trick again. If he had not been very securely hooked I should have lost him. He was four inches shorter than my other fish, and the same size as Mrs. Monell's, 6 feet, but he was very broad for his length.

I had no chance to get the weight of these fish, but I skinned this last fish and sent him to Werner, the taxidermist, of Atlantic City, where he arrived in good condition, and is being mounted.

From what I can learn, tarpon can be caught in the Panuco River any time in the year, but of course the season they are more plentiful is February and March. The river for fifty miles seems to be full of them there. I learned that during the rainy season in July the tarpon at the mouth of the Tamise River where we fished make almost as much noise jumping and feeding as a railroad train. The mullet come down this river from a large lagoon fully twenty miles long, and although it was said to be too early for tarpon, there were as many there ready for business as I ever want to see, although it was only December 28. There is a fascination about this sport that is irresistible. We brought all four fish to the ranch and removed and saved all the scales of the three fish we left there to use as visiting cards. Mrs. Monell was nursed by Aunt Annie for three days, suffering from strained muscles after her day with the tarpon.

As our party had to leave for home, this was our last day at tarpon. Mrs. Monell, while sitting on the porch, remarked that for the last few days she had seen large flocks of canvasback ducks on the river flats at the foot of our bluff. We figured out how we could get some of them. The next morning Mrs. Monell took a stand on a

point with about a dozen of wooden decoys Mr. Kulka had. I went out in his canoe, which, by the way, only weighs 35 pounds, was made in Racine, Wis., and is a very light and handy boat. I kept the ducks moving, and in less than two hours from the house until our return we got 14 big fat canvasback ducks. We were home by 8 A. M. We could have got more, but we had enough. Anyone going there and writing Mr. Kulka, Box 36, Tampico, Mex., far enough in advance, could get accommodations on the ranch; but as he can only take about twenty, it is necessary to write early, as half the trip is the pleasure of being right on the ground and having for a host Mr. Kulka, who will see that your every want is satisfied, as in the city the natives invariably impose on anyone that can't talk their language, but when furnished a guide by Mr. Kulka you have no bother, as he saved us money by giving us boatmen for just half we could have gotten them for.

Our party are planning to go again next winter, and we know there will be several new converts to tarpon fishing, as they seemed to catch the fever from our trip. We are also talking about making up a party to go up about fifty miles above the ranch for tiger and lion. There is a virgin forest of 400,000 acres belonging to a friend of Mr. Kulka's that they claim has lots of tigers and lions, as well as turkeys and deer which can be hunted a few miles above the ranch. But next season I won't forget plenty of light shot for woodcock.

## Fish and Fishing.

### Indians and Seals.

A CURIOUS incident in connection with the bounty upon seals in the State of Maine was brought to my notice during the recent sitting of the North American Fish and Game Protective Association in Portland. The destruction wrought by the common North Atlantic seal among the commercial fishes of the New England coast caused the enactment, some time ago, of a provision in the law according a bonus of one dollar per head upon all seals destroyed. The proof of the killing is the production of the hairy covering of the seal's nose. These noses are brought from time to time to the treasurers of the various municipalities, who, having redeemed them at the rate of one dollar each, destroy the proof in order to prevent the possibility of having it presented a second time, and make a return of moneys paid, to the State authorities, by whom the amounts so paid out are refunded. The Indians engaged in the seal hunt have lately been bringing in so many noses that suspicions were recently aroused, and when, some few days ago, 86 were brought in together to City Treasurer Dyer, of Portland, by Louis Sapico and Joseph S. Dana, of Eastport, who have been located at Pleasant Point, near that city, investigation proved that the noses were bogus, having been manufactured specially for the purpose of cheating the State by the crafty Passamaquoddy. After the Indians had signed the vouchers specifying that they had killed 86 seals, they were taken into custody upon the charge of obtaining money under false pretenses. The arrest is of sensational interest, as it discloses a wholesale system of defrauding the State by bringing in what falsely purports to be seals' noses, and by collecting a dollar each on them. The bogus "noses" are made by cutting up sealskin into small pieces, sewing bristles in for whiskers, and then slitting openings to counterfeit the nostrils. When the bristles are sewn in, a knot tied at the end of each prevents them from falling out, but a sharp yank draws them through the hide and then it is seen that they never grew there. The nostrils are so well simulated that they are apparently genuine until careful examination is made. The deceit, though crude, is clever, and after the inspection of a few of the bogus specimens, I found it quite easy to distinguish between the genuine and the counterfeit noses. The seal's whiskers taper to a delicate point. Those employed by the Indians are stiff and blunt, and quite unlike the real article.

Sapico says that the Indians have been carrying on this nefarious game for a long time, all the way from Portland to Eastport. Thousands of dollars have been dishonestly obtained from towns and cities to be refunded by the State. A man who is familiar with the whole bay says that he does not believe that one-third of the noses brought in have been genuine. At Bangor a similar discovery was made. The very day after the arrest of Sapico and Dana, two other Indians came in to Portland from Cousen's Island, who had evidently failed to hear or to read of the previous day's arrests. They made oath that they had killed one hundred seals between them, and presented as vouchers that number of noses, which proved, upon investigation, to be all bogus. After the examination, both men were compelled to admit that not a single nose of the lot was genuine. They confessed that they bought the manufactured noses from the Indians, who made them, and also that they knew that they would be arrested if they were caught, but there was good money in it, and so they were willing to take the chances. One of the two, named Patwin, has collected more than \$1,000 from the city of Portland alone during the last year. It seemed natural enough to recognize his ability to do so, for he explained some time ago to the city treasurer that he used to go out with his canoe every night and lay on the rocks to wait for the seals to crawl up and inspect the surrounding water. When a dozen or more had thus emerged from the water, he would spring out and beat them down with a stout club. After he had disabled as many as he could, and before they could get off into the water, he would kill them with a knife, cut off their noses, slit a hole in the carcasses and insert in them a rock before pushing them off to sink in the sea. While he brought in some fifty or so a month, the number seemed to be reasonable, since it appeared natural that he should average two or three a night. The present arrests and prosecutions will probably end the imaginary sea killing industry along the coast for some time to come at least. The word has gone out with the exposure of the rascality in both Bangor and Portland, that while the Indians outwitted the pale faces in the first instance, Caucasian intelligence has demonstrated itself as usual in the long run.

### The Netting of Pike-Perch in Missisquoi Bay.

So far as can be learned, there is not much prospect that the spring seining of pike-perch will be prevented this year in Missisquoi Bay, Lake Champlain, though there is a more hopeful feeling as to what may be accomplished in the near future. The present situation may be briefly summarized as follows: Vermont fixes the responsibility for the slaughter of spawning fish upon the Canadians, by an enactment providing that whenever the Canadians shall refuse to issue more licenses for this fishing, none are to be issued by the State. Either the Government of the Dominion of Canada or that of the Province of Quebec can easily put an end to this netting of the spawning fish. The Federal authorities may pass an order-in-council prohibiting any net fishing in the bay, and even if these authorities fail to pass any such order, it is still within the power of the Provincial Government to decline the issue of any licences for such fishing. The committee appointed by the North American Fish and Game Protective Association to urge the prohibition upon the Canadian authorities consists of the entire delegation from the Province of Quebec, and it is already at work endeavoring to educate public opinion to assist it in demanding the change. One argument which, it is hoped, will prove effective is that the nets in Missisquoi Bay in the spring of the year destroy the fishing in the Richelieu, and injuriously affect some of it in the St. Lawrence. Years ago the pike-perch and bass fishing in the Richelieu River was very good. Now it is almost destroyed. Canadian members of Parliament representing counties along the Richelieu River are being appealed to to aid the committee in its work.

### A Pike Swallows a Watch.

A melancholy story is attached to a watch which was once found in the body of a large pike that had been captured in the river Ouse. The fish weighed little short of thirty pounds, and was disposed of to a resident of the locality, whose cook proceeded to prepare it for the family's dinner. In opening the pike she was amazed to find in it a watch, with a short length of black ribbon and a couple of seals attached. Inside the timekeeper, the maker's name was discovered, and on being appealed to he was able to ascertain from his books that he had supplied the watch some time before to a certain gentleman's servant. It transpired that the latter had been drowned in the Ouse a few weeks before the capture of the pike, which had picked up the watch and had made a meal of it. Considering the attraction which bright glittering bangles have for many fish, it is certainly not difficult to believe the stories that are told of a wedding ring having been found in the stomach of a haddock, of a locket in the inside of a bream, of a silver spoon in the maw of a pike, and a half sovereign in that of a mackerel.

### An Invitation to Fish.

W. WRIGHT, in his "Fishes and Fishing," tells an amusing story of a tradesman, who had retired from the fatigues of business, inviting very pressingly a London friend to visit him at his sylvan residence, and, among other inducements, promising, though he was no angler himself, to afford his friend the sport of angling in his water. This attracted the Londoner; a day was fixed, and our angler arrived with a full complement of rods, lines, baits, etc., and was anxious to commence. But, no! luncheon was first to be disposed of, after which the host introduced his friend to his water, which proved to be a little round basin, not wider than the length of one of the rods the angler had brought with him. As must naturally be imagined, the visitor was disappointed and vexed, though he did not choose to show his vexation; and on the assurance that there were perch in the pond, he put his tackle together, and the moment he dropped his bait into the water he hooked a fine perch; another and another followed; and when his friend came to tell him dinner was ready, and inquired as to the success he had had, the angler showed him thirty-five perch. "Well!" said the good-hearted host, "I am glad you have had such sport; I caused three dozen to be put in the day before yesterday." "Oh!" replied the angler, "I will take the other, and then I shall have nothing to do in that way after dinner!"—London Fishing Gazette.

### New York Legislation.

ALBANY, Feb. 13.—No hearings on pending bills have been held as yet by the fish and game committees of either branch of the Legislature, but both committees have done considerable work thus far in the matter of examining measures before them. They have also reported out a number of bills.

The Assembly has passed the following bills: Assemblyman Hubbs (Pr. No. 380, Int. No. 232), amending Section 103 so as to provide that on Long Island ducks, geese and swan shall not be taken from April 1 to Sept. 30, instead of from Jan. 1, as at present; nor possessed from April 1 to Sept. 30, instead of from March 1.

Assemblyman J. T. Smith's (Pr. No. 381, Int. No. 293), adding a new section to be known as Section 3a, which provides that there shall be no open season for deer in Dutchess county before Sept. 1, 1908.

The Assembly has advanced to third reading the following bills: Assemblyman Wemple's (Pr. No. 348, Int. No. 332), providing that there shall be no open season for grouse, woodcock and quail in Schenectady county prior to Sept. 30, 1906.

Assemblyman Reeve's (Pr. No. 402, Int. No. 376), providing that deer shall not be taken at any other time than between one-half hour before sunrise and one-half hour after sunset.

Assemblyman Dickinson's (Pr. No. 160, Int. No. 160), providing that the close season for hares and rabbits in Cortland and Genesee counties, shall be from Dec. 1 to Sept. 15; for mink, skunk, muskrat and foxes, from May 1 to Oct. 31, and for trout from July 16 to April 15.

The Assembly Committee on Fish and Game has reported the following bills:

Assemblyman Bridgeman's (Pr. No. 314, Int. No. 300), amended so as to permit the taking of ducks, known as mergansers, sheldrakes or sawbills in Orleans county, during April.

Assemblyman Coutant's (Pr. No. 415, Int. No. 389), amended so as to provide that tip-ups and set-lines may be used in fishing through the ice in Ulster and Dutchess counties, in waters not inhabited by trout.

Bills have been introduced as follows:

Senator Lefevre, two bills (Pr. Nos. 356 and 357; Int. Nos. 326 and 327), which are the same as those of Assembly Coutant's (Pr. Nos. 416 and 415; Int. Nos. 390 and 389), making the close season for grouse, woodcock, and quail in Ulster county from Dec. 16 to Oct. 15, and allowing the use of tip-ups and set-lines in fishing through the ice in Ulster county.

Assemblyman Bedell's (Pr. No. —, Int. No. 556), striking out of Section 26 the clause making the close season for grouse in Orange county from Dec. 1 to Oct. 15.

Assemblyman Harvey's (Pr. No. —, Int. No. 482), amending

Section 46 so as to make the close season for black bass in Seneca county from Jan. 1 to Sept. 30, both inclusive.

Senator Townsend's (Pr. No. 371, Int. No. 336), amending Section 4 so as to provide that wild deer and venison shall not be possessed from Nov. 6 to Aug. 31, and that possession thereof from Nov. 1 to No. 6 shall be presumptive evidence that the same was unlawfully taken by the possessor. The bill further provides that no wild deer or venison killed in this State shall be sold, offered for sale or exposed for sale at any time or place, nor shall the same be transported or carried out of the State.

Assemblyman Reeve (Pr. No. 477, Int. No. 438), amending Section 158 so as to provide that shellfish leases may at the expiration of the terms thereof or upon the expiration of any renewals thereof, be renewed for a term not to exceed fifteen years, upon it being shown to the satisfaction of the State Commission that the lands described therein have been used in good faith for shellfish cultivation continuously during the original terms for which such leases were granted and during any previous renewal or renewals thereof.

## The Kennel.

### "Just Happened So."

THE reading of an editorial on events that "just happened so," dusted off a section of my memory and brought vividly before me many days a-field where the success must be attributed to things that "just happened so." My two last hunting trips each had an abundance of chance in determining their successful outcome. A few weeks since a friend and myself planned for a day off to hunt with our cameras. As we were about to separate the night before, a farmer accosted us and the question of game was at once referred to. He said foxes were fairly plenty, and volunteered to loan us his beagle hound, saying "he used to run foxes, but had not been hunted for four or five years." We changed our plans at once, deciding to substitute our guns for the cameras. We arrived at the farmer's in the morning as the sun was just peeping above the crest of Spruce Mountain. The little beagle was pulled from under the stove and placed in the sleigh, the farmer cautioning us not to snap our guns, for the dog was gun shy. The midget of a hound had been stall fed, was sleek and fit to kill. A drive of half a mile up the mountain brought us to a favorite run-way. Here we found a fresh track. The dog was cut loose on the trail, but he absolutely refused to notice it. We were disappointed, for we expected a little music, but the shooting of the fox we did not anticipate. Having broken several young hounds, I knew a two-hour tramp would jump the fox, so we determined to tramp it up. A little over the two-hour limit Mr. Reynard was awakened from his midday nap. Now was the opportune time to test again the little dog's hunting qualities; so calling him from heel (a position which he had held for the past two hours), we spoke many encouraging words to him, and placed his nose on the steaming trail. There was an awakening as from a dream, an expression of joy lit up his countenance, a nervous wag of the tail, a low whimper, and he was away in full cry. I looked at my watch; in just ten minutes the eager cry ceased, and at that moment, at the further end of the timber, a fox hove in sight, coming in rapid jumps directly toward us. When within a hundred yards it tacked sharply to our right and went over the ridge from our view. On came the little dog, but his musical voice was silent. He was, however, sticking to the trail, but was puffing and blowing, being well out of breath. In eighteen minutes the fox again came in view, this time within shooting range. We both, simultaneously and unconsciously, pulled the trigger at the same instant; there was one report, and a beautiful male fox, weighing 10½ pounds, was lying dead sixty yards away. We waited several moments for the dog to come up, when we recalled the farmer's caution of gun-shyness. Returning to the farmer's, we found the dog eating his fill from the carcass of a cow. The little dog never knew the final result of the hunt, and it seems to me the successful result "just happened so."

BARRE, Vermont.

### Pointer Club of America.

THE Pointer Club of America held their annual meeting on February 11, at Madison Square Garden. A large attendance of members was present. Mr. R. A. Fairbairn, vice-president, presided. Considerable routine business was disposed of, and special prizes were donated to the following for competition at their forthcoming shows: New England Kennel Club, Franklin-Oil City Kennel Club, Rochester Kennel Club, Chicago Kennel Club, Duquesne Kennel Club.

It was resolved to hold field trials of 1904 in the South, for pointers only, and competition open to all, excepting that of the Members' Stake.

The election of officers resulted as follows: President, R. A. Fairbairn; Vice-President, A. H. Ball; Secretary-Treasurer, C. F. Lewis; Board of Governors—G. Muss-Arnolt, Dr. J. S. Howe, Geo. S. Mott, Geo. S. Raynor, E. W. Throckmorton, C. P. Wilcox, W. C. Root, Dr. A. G. Terrell; Delegate to American Kennel Club, A. H. Ball.

C. F. LEWIS,  
Secretary-Treasurer.

### Trained Nurses for Sick Dogs.

The New York Herald's London correspondent says: "Another society doing good work in connection with relieving the sufferings of dumb animals is the Dogs' Protection League, which is now taking women probationers who will undergo a thorough course of dog nursing. At the end of the course the canine nurse will undergo examination and will then receive a certificate from the league, which will then, should she pass, send her out to cases the same way as a human nurse. Those who have experienced the weariness of night and day nursing of some old favorite will greatly appreciate the chance of trained help at a moderate figure."

### Points and Flushes.

The American Fox Terrier Club has issued a booklet, containing the rules, list of members, standards, and stakes for 1904. Mr. H. H. Hunnewell is the secretary and treasurer. The address of the A. F. T. C. is 87 Milk street, Boston.

## The Maiden Cruise of Istar.

From Greenport L. I., to St. Johns, N. B., and Return,  
July 16 to September 8, 1903.

BY BROOKS H. WELLS, NEW YORK CITY.

(Concluded from page 185.)

August 8. About 3 A. M. the skipper was awakened by the rattle of chain, and, looking out, found that the fog was being blown seaward by a gentle air from N.W., and that the Twilight, a St. John pilot boat, was getting under way. Skipper started to do likewise, and had gotten the cable short and the gaskets off the sails when the mate appeared on deck. At 3:30 Istar was passing the harbor light and ran on with a gentle wind and fair tide to a mile outside Libby Island when the tide began to run flood. The dawn was beautiful, clear, and very cold. At 6:55 passed Moose Peak Light, nineteen miles from our anchorage. The schooner yacht Elmina had just come out the main channel way from Mistake Harbor. She was beautiful in the clear morning light, and

The "Yacht" Maple Leaf—St. John's River.

going like a race horse to the eastward. Running along by the desolate red granite escarpments of Great Wass Island and by Cummings Head, Petit Manan tower lifted itself like a little gray peg from the western horizon, and Istar reached straight for it along a shining blue sea, smooth except for the ripples of the offshore wind and the long swell rolling in from southward.

As is usual along this coast with a northerly wind out of a clear sky, the breeze failed, and at 8:30 we rolled in a flat calm midway between Moose Peak and Petit Manan. At 9:30 the expected S.W. wind came in as a light air, but failed after a half hour, and again it was calm. An hour and a quarter later it came back as a brisk true breeze, but with enough westing so that we could not lay a course nearer than two points for Petit Manan.

An Inland Light—St. John's River.

and Schoodic. After a fine sail, with, at the end, all the wind we could stagger under, anchored in Winter Harbor at 2 P. M.

August 16. We had spent an enjoyable week in exploring every nook and corner about Mt. Desert Island and Frenchman's Bay, and now had been becalmed since early morning off the Point of Otter waiting for the wind that would bear us westward. It came at noon, so that it was a close reach from the Nubble bell through Casco Passage to Eggemoggin and a broad reach through to Buck's Harbor, with balloon jib and wind so fresh that our stout topmast bent "like a willow wand." The mate was much interested in the tame foxes on the little island that makes the harbor.

Sailed to Castine the next morning and from there in a driving thunder storm with reefed sail to Turtle Head, and then in light airs to Seal Harbor near Islesboro. Night closed in looking thundery, and we found use for a second anchor in a severe squall about midnight. Drifted the next day with light airs to the Herring Gut. At sunset the sky in the west was clear lemon yellow,

with a line of low-lying, heavy, smooth-edged clouds which brought the next day a fresh gale from S.W. In the morning we ran up the beautiful Damariscotta River to East Boothbay, where we lost an anchor on the foul bottom in spite of two hours' maneuvering trying to get it. Had an enjoyable run up the river in a fresh gale, and anchored a little below Damariscotta for the night.

The next day was an unpalatable mixture of heavy rain, thick fog, and fickle breezes. Istar felt her way down the river and around to Boothbay and Townsend Gut.

August 21 was a fair, bright day, with a brisk N.W. wind and a heavy rolling swell from the southward, so that we had an exhilarating run nearly to Mark Island, where the wind backed and came out very light from ahead. The big rollers helped to push us in by the Whaleback, and we went by way of Chandler's Cove to Portland.

August 22. At 4:30 A. M. the skipper opened his eyes and went on deck. Dawn was just breaking. The west was dark and threatening. Barometer was 29.74, and dropping slowly. Last evening there was a brilliant Aurora. The wind was S. Everything portended a gale. We determined to run out for a look at things off the Cape. Just outside Portland Head the skipper ordered jib in and a reef in the mainsail. By the time this was accomplished, we were in a big chop coming in from S.E., and the wind was fast freshening. Made our way out to Old Anthony in a fairly heavy sea and fresh gale with very threatening sky. A friend who had come aboard at Bar Harbor and who had showed signs of nervousness during the exhilarating run from Boothbay to Cape Small, was badly frightened. The mate was demoralized almost to the point of mutiny, and evidently wished himself ashore. The skipper, sorry to throw away so good an opportunity to try what Istar could do against wind and sea, kept on for a half hour, then reluctantly put the helm up and ran back, feeling angry and hurt that any of his crew should have shown the white feather. By Portland Head we met a bark going out under courses and lower topsails. In spite of calamitous looks and quite unnecessarily urgent protests from the two, Istar

Point Lepreau—Bay of Fundy.

was turned about and sailed out a mile or so to watch the maneuvering of the bark. Then back we drove, and hardly had we reached our anchorage when the friend, whose nerves were in tatters, went ashore for a bracer and the train home. Lay at anchor all day wasting a beautiful fresh S.W. wind. Several sail and steam yachts bound west ran out, but all came promptly back.

The skipper was unhappy until, as he groped about in his mind for an adequate reason for the mutiny of the morning, he saw this picture, understood, and forgave:

A tall ship, clothed from her trucks down, is speeding along through the night. From out the darkness a sudden blast bears her over, over until the water pours in upon her deck, until her lower yards dip almost to the leaping seas. The crew, pressed by the hand of fear, and the hoarse voice of command, are straining every fibre to relieve her from the overbearing pressure of her canvas. A sailor, known as the best and bravest on the vessel, goes up, up through the howling blackness to the topmost yard, the main royal. The sail has been clewed up and he is out on the leeward arm ready to make all snug and fast. The clew line gives way and the sail, driven by the fury of the wind, sweeps him from the yard except for the frantic clutch of the fingers of a single hand.

Beaten by the flapping canvas, he seeks in vain for a new hold, until, when despair had almost crushed his soul, he feels and grips the taut strands of the leeward lift. Unconscious of his torn and bleeding hands he fights his way inch by inch up this slender line to the masthead, slides down the spar to the royal yard again, and makes fast the sail. The ship, now stripped to her lower topsails, some canvas furled, some blown to ribbons from the bolt ropes, is running off before the storm.

Years have gone, and when skies are blue and winds fair the incident seems almost forgotten. Yet when the heavens cloud and thicken with the coming of a summer gale, his heart grown faint with dread that he may feel again the chilling clasp of the clinging arms of death.

August 23. We had sail up and ready at 5 A. M., but wind did not come until after 8. The yawl Mattacheeset, 28ft. waterline, passed out by Portland Head a mile and

a half to windward of us. We gained on her steadily, and she ran by Old Anthony eighteen minutes in advance, but we caught and passed her half way between Wood Island and Cape Porpoise, sailing fourteen miles to do so. Wind light and ugly old sea. After this it was a drifting match. In the tumble we could drift fastest, so that we made our anchorage among a crowd of vessels in Porpoise Harbor, had dinner and the dishes washed before Mattacheeset appeared.

Aug. 24. The clink of a windlass as a fisherman began to get in his anchor roused the skipper and the mate. In the east a pale gray rose showed the coming of day. Overhead, the stars still shone in a cloudless dome, and little ripples ran from the north over the smooth water. The fleet was waking up. There was the rattle of chain, the chirp of blocks as sails slowly rose along the masts, and from somewhere the faint fragrance of old Mocha. Istar spread her wings, and slowly glided out from the calm circle of the port to the heaving roll of the open sea. The tide was low, and the rounded swell ran swiftly and smooth as oil until it broke and crashed into foam on the black, weed-covered rocky fangs that guard on either hand the harbor's mouth.

In the east the glow deepened. Red, orange, azure

Moose Peak Light—Entrance to Mistake Harbor.

and purple, above the sharp cut line of the horizon; silver flecked, with flame below, burned sky and sea until the sun came swiftly up and day had begun. A couple of small black whales, like huge porpoises, swam with soft blowings. In the far northwest the mighty peaks of Washington and his lesser fellows of the Presidential range stood faintly clear in the soft morning light, overtopping all of the nearer hills. From Point Arundel west and south curved the green level line of shore to Agamenticus, and seaward rose the tall dark tower of Boone Island.

Istar, deserted by the wind and rolling idly on the swells, led by a mile the bunch of yachts, fishermen and coasters that had followed her out of the harbor.

She drifted slowly along until 11, when the wind came out from S.S.E., a fair breeze. At 11:15 Boone Island and the Nubble were abeam. At 1:20 Appledore and

Desolation, Cummings Head—Near entrance to the Bay of Fundy.

Smuttynose had risen out of the haze, and we were leaving them broad off the port quarter. Later the wind failed to an almost imperceptible air, so that when the Cape Ann lights flared out we were still a mile north of Halibut Point, and Mattacheeset, which had started a mile astern of us, was far off to leeward, a tiny speck against the sky, at sunset. Drifting along through the night, at times uncomfortably close to the reefs, it was nearly 1 when the great towers on Thatcher's Island lay astern. Soon after a breath came in from the N.E., and as the night was so far spent, the skipper turned her head toward Provincetown, the mate taking the stick. At 3:30, when he relieved the mate, there was a brisk breeze, and the topsail had been taken in. At 4 the skipper set it again. Istar, bowing a little to the growing swell, was making steady progress.

Sunrise revealed a horizon transparently clear in the southeast, but with a suspicious dimness in the southwest. There was no land in sight, and everywhere the sky ran down into the sea. The wind now began to veer rapidly by E. and S. to S.W., and the barometer to

fall; so that at 7:30 the topsail was again on deck. It was plain that we were in for a blow, and the skipper laughed silently in his heart, for he knew that this time his crew could not protest. At 8:30 set the small jib and took in staysail. At 9 lay to and reefed the main-sail. The sea made up rapidly, and soon we were fighting our way over the lower end of the Stelwagon bank against a heavy, steep while-crested chop. Five miles N. by E., from Race Point, we needed the second-reef, the gale becoming stronger minute by minute. Finally, just as we were slacking down the sail for a close reef, the wind fell within a few seconds to a flat calm.

You who have been there know how unpleasant and dangerous a heavy breaking sea becomes when the wind deserts you.

A big, white-headed comber, towering high above his fellows, came rushing along, stood Istar on end so that the water came in over the stern into the cockpit, and pushed her backward so rapidly that when the wave passed and the bow fell, it came down like a great hammer right across the nose of the tender. We looked for fragments, but to our surprise, when we had hauled what we supposed were the remains up from the depths, it was still a boat, though the sheer stroke at the

U. S. Cruiser Newport.

bow looked as if a shark had been playing with it. By great effort we got the tender aboard across the cockpit and saved here. Smashed about in a heavy, rippy sea for some ten minutes, and then the strong wind came again as suddenly as it had gone, and we rushed away for Provincetown, where we dropped a hook in the early afternoon. We looked Istar over, and found that she had sustained no damage other than the loss of some of the green paint from her bottom.

Tired and sleepy, we turned in at sunset, and slept soundly until 7 the next morning. All day we lay at anchor, and after drying out and cleaning ship, loafed and dreamed, for within the circle of the bay is much to dream of. Here, Nov. 20, 1620, the Mayflower first dropped her anchor to the sands of the western world; here the first contract of mutual government was signed; here the first child was born in the new colony, and here our foremothers did their first Monday washing. It is quaintly told in "Mount's Relation" how the Mayflower had sailed from her English port on Sept. 16, 1620, and how, "after many difficulties in boisterous stormes, at length by Gods providence vpon the ninth of November (Nov. 19) following, by break of the day we espied land which we deemed to be Cape Cod, and so it proved. And the appearance of it much comforted vs, especially, seeing so goodly a Land and wooded to the brinke of the sea, it caused vs to rejoyce together and praise God that had giuen vs once againe to see land. And thus wee made our course South

Bald Porcupine Island—Frenchman's Bay.

South West, purposing to goe to a Riuer ten leagues to the South of the Cape, but at night the winde being contrary, we put round againe for the Bay of Cape Cod; and vpon the 11. of Nouember (Nov. 21), we came to an anchor in the bay (Provincetown Harbor), which is a good harbour and a pleasant Bay, circled round, except in the entrance, which is about foure miles ouer from land to land, compassed about to the very Sea with Okes, Pines, Iuniper, Sassafra and other sweet wood; it is a harbour wherein 1000. saile of ships may safely ride, there we relieued our selues with wood and water, and refreshed our people, while our shallop was fitted to coast the Bay, to search for a habitation; there was the greatest store of fowle that euer we saw.

"The bay is so round and circling, that before we could come to anchor, we went around all the points of the Compasse. We could not come neere the shore by three quarters of an English mile, because of shallow water, which was a great preiudice of vs, for our people going on shore were forced to wade a bow shoot or two

in going a-land, which caused many to get colds and coughs, for it was ny times freezing cold weather."

The woods have gone and the cape is now bare and wind-swept, but often in the soft light of the crescent moon when

"The whispering waves were half asleep

And on the bosom of the deep the smile of heaven lay,"

you may, like many another dreamer, have seen the Mayflower riding to her anchor and the flocks of sea birds resting in their flight to the south.

At 6 on the morning of Aug. 27, Long Point Light was abeam, the wind was brisk N., and we were expecting a fine run over the shoals. At 8 we were off Race Point in a head tide and light head wind. At 2, Race Point was still abeam, and the light air ahead. We had hope of getting over the shoals on the westerly set of the night tide. This was only hope, for we drifted all night, and at 7 the next morning were still in sight of the Highland Light, and the calm continued. Broad of the port bow two white streams shot into the air, curved out from each other, and fell back into the sea. "Blows!" yelled the skipper. "Blows! blows!"

"What are you giving us?" came a voice from below, but its owner nevertheless came tumbling up on deck, and we all watched with great interest the antics of a school of right whales leisurely making their way up the cape, blowing at regular intervals, and at times tossing their great flukes high out of the water. Fin-backs and blackfish are seen quite often, but the right whale is now almost an unheard-of rarity along this coast. Yet one reason why the Mayflower adventurers settled at Plymouth was that "Cape Cod was like to be a place of good fishing, for we saw daily great Whales of the best kind for oyle and bone, come close aboard our Ship, and in fayre weather swim and play about vs; there was once one when the sun shone warme, came and lay aboute water, as if she had beene dead, for a good while together, within half a Musket shot of the Ship, at which two were prepared to shoote to see whether she would stir or no; he then gaue fire first, his Musket flew in peeces, both stocke and barrel, yet, thankes be it to God, neither he nor any man else was hurt with it, though many were there about; but when the Whale saw her time she gaue a snuffe and away."

While the whales were still playing about us a little air from S.E. came in, and very gradually freshened as we ran on, so that at 2:23, when we had passed the four lightships, marking the intricate way over the shoals and set our spinnaker for the run from the Handkerchief to Hyannis, it was a good wholesail breeze, and at 4:30, when the Hyannis Breakwater lay outside, it was blowing a light gale. During Saturday, Sunday and Monday there was a heavy blow from eastward, and with decks wet with the flying spray, Istar pitched and strained at the two cables which held her to her anchors.

At Hyannis the skipper's wife and daughter came aboard, and had a jolly time, while Istar went by easy runs to the westward and home.

The total distance sailed on this cruise was 1,645 sea miles, including all the twists and turns from Greenport to Greenport. While there was less fog than usual, there were many days of strong winds and many days of calm. The average speed per hour's sail was a trifle less than five and one-quarter nautical miles.

Finis.

### Scooter Races.

On Friday, February 12, a scooter race was held off Blue Point on Great South Bay. The race was to decide the championship of Suffolk county, and as the conditions were satisfactory it was an unqualified success.

Some twenty-five boats entered, and the course was 18 miles; three times around a six-mile triangle, with two miles to each leg.

At the end of the first round Leader, owned by Captain William Still, of Bedford, was first, 1m. 42s. ahead of Daisy, owned by Mr. Morgan, of Bayport. Leader was again in the lead at the end of the second round by 3m. 6s.; Vamoose, owned by Mr. C. W. Ruland, of Patchogue, was second. On the last round Leader increased her lead, and won the race by 6m. 43s. Vamoose was second, which boat did very well, considering she had met with an accident. The scooter owned by Mr. Wilmot D. Overton, of Bayport, finished third.

The House Committee of the New York Y. C. has arranged for the following entertainments:

Sunday, February 14.—Chamber music, 4 to 6:30 P. M. Von Praag's orchestra.

Thursday, February 18.—Lecture, "The Depths of the Sea" with stereopticon views, Mr. C. H. Townsend director, New York Aquarium.

Thursday, March 3.—Lecture, "London and the Coronation of the King" with stereopticon views, Mr. D. L. Elmendorf.

Sunday, March 6.—Chamber music, 4 to 6:30 P. M. Von Praag's orchestra.

Thursday, March 17.—Mr. Charles Battell Loomis, humorist.

Sunday, March 27.—Chamber music, 4 to 6:30 P. M. Von Praag's orchestra.

Thursday, April 17.—Lecture, "Paris to New York Overland" with stereopticon views, Mr. Harry de Windt.

Thursday, April 14.—An Evening with the Commo-dore.

## Power Yachting.

BY PARKER H. KEMBLE.

A paper read before the members of the Winnepesaukee Y. C. at the Hotel Bellevue, Boston, Mass., on Jan. 6.

The history of steam yachting in America practically begins about 1857. The first small power boat was built by John Aspinwall, then a boy, to sail in a pond on his father's place. The boat was 12ft. long by 3½ft. wide, flat bottomed, and the burner consisted of six alcohol lamps, the fuel being quietly procured from a demijohn in his father's pantry. He paddled around the pond at the rate of one-half mile per hour, much to the disgust of the swans.

Two or three other boats were built, and in 1865 he, with some of the other boys of the parish, built a flat bottomed side-wheeler some 20ft. long drawing only 5in. She was sold to a Southerner for twice what she cost and taken to Savannah.

The next launch was 35ft. long. At this point the history broadens, and we will leave it and take up the situation at present.

The dividing line between what is commonly known as a power boat—that is, a boat propelled by some mechanical agency not steam—and a steam-driven boat—a steam launch—would seem to lie between 60ft. and 70ft. Not that boats over 70ft. have not and will not be built

Succoneset Shoals Light Vessel—Nantucket Sound.

with gasoline engines, or boats less than 70ft. with steam engines; but when 70ft. is passed and a fixed professional crew is required for the engine room, the reliability of steam and the less cost of coal becomes a strong argument in its favor. Similarly under that length the gasoline engine or electric motor has the greater convenience. In the smaller powers required for launches—from 15ft. to 60ft.—the weight and space occupied, particularly in cruising boats, is most decidedly in favor of the gasoline motor. For speed, however, it is still an open question whether even for boats as small as 30ft. steam will not give a higher speed than any other form of power. In discussing racing boats this comparison will be taken up again.

Power boating has outgrown the yachting field, and is now taking an important part in many aquatic industries; canal boats, fishing boats, lighters, oyster boats, mail carriers, custom house officers, and harbor police, form but a part of the list of commercial enterprises in which the power boat is a welcome arrival.

Compared with the earlier models the changes are numerous and noticeable. The rank sheer has been done away with, and the boats have more freeboard amidships and less at the ends. The long clipper bow ending in a pole the size of a broomstick and dignified by the name of bowsprit, has given place to the modern clean cut full lined entrance; while the putting into practice of the theory of clearing and fining the run by section lines instead of waterlines has led to the various present types of stern, which are a vast improvement both for speed and weatherliness over the fantail formerly in vogue. When

A Five-Master—Portland Harbor.

I first began to take interest in yachts and boats, there were several steam yachts from 40ft. to 70ft. waterline, with masts, bowsprits, deck houses, pilot houses, and all the paraphernalia of the able bodied ocean-going cruiser. Now the fashion has set the other way, and while some, notably the fair sex, decry the loss of spars, the general type of clean cut, powerful launch model which is now established up to 100ft. or so is certainly safer at sea and less work at anchor. The passing of the glass house with its horse-car effect and the advent of the strong and compact trunk cabin is another visible sign of the wholesome tendency of modern designing. While speed on the whole has increased somewhat there is at present a large fleet afloat and under construction of distinctly moderate speed, and for every question asked me about speeds above 12 knots, three or four are asked about 8, 9, or 10. Possibly the large increase in prime cost and maintenance for each additional knot may have something to do with this, but I think that probably the desire for more comfortable

accommodations than afforded by the racing hull has the greater influence.

For general consideration small launches may be divided into three classes—racing, cruising, and day boats. No boat can fit all three, but may fit more or less well into two of them.

For driving power there are three divisions also—internal expansion engines, where the fuel is burned separate from the engine, and internal combustion, where the fuel is burned directly in the engine, and electric power. The steam, alco-vapor, and naphtha engine come under the first heading, and the gas, gasoline, and kerosene engines come under the second. For general purposes steam and gasoline are the two rivals for popular favor, and at present the craze for autoing which has swept the country, added to its natural advantages for small units, has pushed gasoline way ahead of its older rival. Gasoline engines are cleaner, start quicker, and take up less room in small boats, and require no Government license. Steam is more reliable and for extreme speed at present is ahead.

Turning now to the general design of the hull, we find the problem dividing itself into two parts—the shape or form of the hull and the construction. Taking up the form first, the characteristics of the boat depend on the form of hull, and this in turn is governed by the use for which the boat is designed. Form may be expressed briefly by two expressions—proportion and fineness. By proportion is meant the general relation of L. to B. and B. to H. where L. is the length on L. W. L., B. the greatest beam, and H. the draft of hull. By fineness is meant the relation between the block obtained by multiplying  $L \times B \times H$  and the actual bulk of the underwater body of the boat. This is expressed in the form of a decimal fraction and called the block coefficient, i. e., a boat having a body  $\frac{1}{2}$  of the product of L. B. H. would have a coefficient .5. On the coefficient depends the displacement or weight of the boat, and of two boats having the same dimensions, that having the greater coefficient will have the greatest displacement. In small boats the ratio of L. to B. varies from 1:4½ to 1:9; anything below 4½ gives a tubby, awkward shaped boat hard to drive and bad in a head sea, while anything greater than 8 or 9 gives a cranky, unhandy boat, and one which is structurally difficult. On a given length it may be safely said that within the given proportions greater beam leads to comfort, stability and seaworthiness, but slower speed, while lesser beam gives less resistance and greater speed for the same power, but less room and less safety. The relation of B.:H. naturally depends on that of L.:B., a broad boat tending to shallow draft, while the narrow hull takes it out in depth. So far we have been dealing only with the underwater portion of the hull. The upper part varies as the use of the boat. If speed is wanted, then freeboard is cut down; if cruising ability is called for, then high freeboard appears. From the above it can be readily seen that speed, safety, weatherliness, and roominess cannot be all at their maximum in any one design. There must be a compromise between them.

In the last few years there has been a radical change in launch design. The old conventional hollow-bowed, pot-bellied, fantail stern monstrosity has, or is, fast disappearing, and seaworthy, speedy models are taking its place. In no part is the change more noticeable than in the form of the stern. The sharp, pinkey stern developed by Mr. Arthur Binney, or the torpedo boat or French stern, are characteristic of practically all modern launches. One advantage of the short stern more important to steam launches than to gas boats, is that as the length enters into the tonnage measurement you can get more boat for the same length and better speed lines than with the fantail or long overhang. The main purpose of the change was, however, to obviate the squatting or settling of the stern when driven, as well as the rising of the bow, so noticeable with the older type of stern. Returning for a moment to the coefficient of fineness. The fineness of the after body of a boat depends not on the lines but on the disposition of the displacement. This being so, the after part of the boat can be made narrow and deep with fine waterlines, as in the old models, or very shallow and wide, as in the new. In either case the displacement remaining the same. With the broad flat run the boat sits firmly on the water, and her stiffness is materially increased; while the water has a clear unobstructed flow to and from the propeller. When under way the broad flat stern prevents settling aft, and keeps the boat to her designed lines. There is no question that for a given power the flat stern will give better results as regards speed. The  $\boxtimes$  or cross section of the boat at largest point should show no freakish features. It should show a fair rise of floor, a well rounded bilge running to straight at the rail. If very shallow draft is called for, then a flatter floor and a hard bilge must be given, but for structural as well as speed requirements, well rounded sections are desirable. In small racing craft a flat floor is somewhat of a necessity, as the beam cannot for safety and room be reduced below a certain figure, and the only way to avoid unnecessary displacement is to flatten the floor and harden the bilges.

The special points in the design of racing boats are saving of weight and easy lines. The former is obtained by cutting down scantlings, freeboard, and fittings; the latter by great length and small displacement. Length is a vital factor in speed. At a given speed all boats throw a wave of a certain length or distance from crest to crest independent of the length of the boat. If a boat is too short she will simply climb up the back of the wave all the time and waste power, while if proportionately long enough will ride between the two crests on nearly an even keel. This explains why often lengthening a boat with no increase of engine power gives greater speed. One special point to be considered is not to use too small a wheel. The difference between 22in. and 28in. draft on a 25ft. or 30ft. launch is not usually important, and the difference in wheel efficiency is much. As regards length ratio, don't go above 8½ unless you have a first-class designer. Even then it is doubtful in these small boats whether it pays.

See that the engine is so placed that when lying stopped the boat is very slightly down by the head. As speed depends greatly on spreading out the displacement over long easy lines, avoid overhanging bows with forefoot cut away; the forefoot should be carried to nearly the full

draft of the hull proper and be as near square as possible. If rough water is to be encountered occasionally, keep the forward weights well back from the stem and the buoyancy of the bow will give the lift necessary.

At present many designers, influenced by sailing practice, have carried the overhanging bow into launch work. It might be all right in cruising boats, where it unquestionably helps to lift the bow in a sea, but in a speed model it is unnecessary and even harmful. As said before, length gives speed and the bow should be carried down straight so that when the boat lifts out forward, as all boats do somewhat when driven, no matter what the model, the waterline will stay the same length and remain as sharp and easy as when at rest.

In designing the hull the actual conditions when under way must be considered, and to spend time and money in building a long narrow boat to pass cleanly through the water and then have her rear up in the air and not use several feet of length and shove a rounded breast against the sea is not common sense. A little flare in the bow sections is useful if well above the waterline. The question of weight is too obvious to need mention. Carry the engine seating well forward and aft of the engine; a fourth of the boat's length is not excessive in boats under 40ft.

In cruising boats the requirements are very different, high freeboard, round bows verging on the bluff, a ratio of about 5 and substantial construction is the rule. The pinkey stern is better than the flat as easier in a following sea. Trunk cabins with dead lights as seen on sailing yachts are stronger and look nater than the old horse-car window house, and you can slam into a head sea without any compunction or fears for your cabin carpet. One thing in particular, always have either a water-tight cockpit if the boat has a cabin, or else two water-tight compartments or air tanks if she is an open boat. Sooner or later you will take water aboard in large quantities, and they will prove handy. Then again, in laying out the cabin do not take in the whole boat. The cabin is for sleeping essentially, for a living room or dining room only occasionally. Practically all the time is spent either on deck or ashore, and deck room or a large cockpit will do more to render cruising comfortable than a palace below and a wash-tub set into a 3 by 4 deck above. Speaking of wash-tubs. On the Ambra, my old 21ft. yawl, the cockpit was small and water-tight, and by plugging up the scuppers and letting water stand in the sun a little while I have had many a good bath when down East and the ocean too cold for comfort. Another hint, if building for genuine cruising, don't put your galley way forward in the most cramped place on the boat. Cooking is not a joy, and if we follow the English fashion and place the stove and other gear at the after end of the cabin neatly mounted then you can step out to help with the boat, can stand up, at least have the full head room, and last, but not least, always have fresh air. I made one cruise on a boat fitted this way and it was simply perfect.

Carry plenty of fresh water and if you can afford it use only tin-lined copper. If you use galvanized iron do not drink any of the water for at least two weeks, in order to allow the tank to get well pickled. I learned that in a trip round the Cape in a knockabout when both my companion and myself were almost too sick to move with zinc poisoning, and a heavy sea and wind making matters interesting. A word more. Have everything strong, even if heavy. An anchor davit that doubles up like tin when you put a strain on it in a tight corner, or a cabin door or skylight that splits when a sea causes you to lean up against it, are causes of profanity.

Passing now to day boats, boats for afternoon sailing with family and friends. These require more speed, or at least as much as the cruiser, and much room to move round in. If under 20ft., 4ft. beam is permissible, but 5ft. is better; above that a ratio from 4 to 6 will cover. Be sure and have air tanks or a substitute for them. These small boats are good sea boats as far as they go, but some means of floating the boat if filled should be provided. Speed varies with the owner's purse, but the less speed the more comfort.

In powering boats one thing must always be borne in mind, and that is that a big engine does not necessarily mean a fast boat. Each hull has its possible speed, and beyond that no power can appreciably force it.

For all around work the 4-cycle gasoline engine seems the most satisfactory, and although in its present form heavier than need be, owes much of its popularity to the strength and freedom from accident due much to this very weight. As it is impossible to get an accurate formula for power in gasoline engines brake horse-power is the only reliable test, and that many makers will not guarantee. No gasoline engine should, however, be purchased for a speed hull, unless that brake H. P. be guaranteed.

As regards installing, time will allow but a word. The better the connection between engine and boat the better the results. This means designing the hull with reference to engine location and building accordingly.

The other most important point is the gasoline tank. Tanks should be made of good heavy material—copper preferred, galvanized iron next. Seams should be well riveted and afterwards soldered. Wash plates to prevent surging of the gasoline should be fitted inside. Where possible the tank space should be ceiled and the tank made a close fit to prevent bulging. The bottom of the tank should be above the vaporizer to drain well. The best method of installing is to place the tank in a copper-lined box above the waterline and run a drain pipe from the box to the sea. The filling pipe should run to the deck, so that any gasoline spilled will run overboard, not inboard. The pipe connection to the engine should run outside of the boat if a cabin boat, but may run inside if she be open. Have a valve at the outlet of the tank and just in front of vaporizer. Put your strainer where the gasoline goes in to the tank. It is hard to get at if at the bottom of the tank. Be sure and have a hand hole in the tank to clean out when necessary.

Passing now to what is doing. The auto enthusiasts are going into power boating; 40ft. boats with 75 horse-power are a fact with speeds of 20 miles; 60ft. boats with 120 horse-power are a fact with speeds of 23 miles, while the limit has not been reached. One French auto maker is building a 90ft. boat with 160 horse-power—four 40

horse-power auto engines set tandem.

In the smaller classes all kinds of freaks with all kinds of claimed speeds. In England the Harmsworth cup has been won by a Napier auto motor in a hull so lightly built that instead of a deck they used oiled cotton canvas. In France they have a 25ft. boat with a speed of 16 miles. All of these are racing shells, and unfit for anything but smooth water. What the future holds in store we cannot tell, but what I confidently look forward to is the re-entry of steam into the arena, and speed varying from 20 miles for a 25ft. boat to 38 miles for a 60-footer. In some of the auto papers lately there have appeared some rather partisan comparisons between steam and gasoline as motive powers. Perhaps the easiest method of comparison is by tabulating results in existing boats:

#### GASOLINE.

22ft. by 4ft. with 7 H. P., gave 14 miles.  
25ft. by 4ft. with 7 H. P., gave 12 miles.  
27ft. by 4ft. with 9 H. P., gave 14 miles.  
28ft. by 5ft. with 11½ in. with 14 H. P., gave 12½ miles.  
35ft. by 5ft. 9in. by 12ft. with 15 H. P., gave 13.85 miles, D. 3,950.  
35ft. by 5ft. 4in. with 25 H. P., gave 18 miles.  
55ft. by 6ft. 6in. with 120 H. P., gave 23 miles, 1902.  
58ft. by 7ft. 6in. with 110 H. P., gave 23 miles, 1903.

#### STEAM.

25ft. by 5ft. 6in. H. P. 25, speed 12 miles, 1896, D. 2,800.  
28ft. by 4½ft., 17 miles, 1896.  
30ft. by 4½ H. P. 26.0, speed 21.87 miles, 1898.  
60ft. by 9ft. 3in., speed 23.60, 1894, D. 9½ tons; load 3 tons.

Of the latter I will say that she was a seagoing boat, and carried accommodations for two officers and four men, and a trial load of three tons.

Compare this with either of the racing shells with gasoline machinery.

### New York Y. C.

THE annual meeting of the New York Y. C. was held at the club house, West Forty-fourth street, on Thursday evening, February 11. Commodore Frederick G. Bourne presided and the following officers were elected: Com., Frederick G. Bourne; Vice-Com., Henry Walters; Rear-Com., Cornelius Vanderbilt; Sec'y, G. A. Cormack; Treas., Tarrant Putnam; Meas., Charles D. Mower; Regatta Committee, S. Nicholson Kane, Newbury D. Lawton and T. H. Wales; Committee on Admissions, Henry C. Ward, Frederick Galatin, Cornelius Vanderbilt, James A. Wright, Tracy Dows; House Committee, Thomas A. Bronson, Henry Sampson, Jr.; J. Lorillard Arden; Library Committee, Lewis A. Stimson, Thomas A. Bronson, Francis W. Belknap; Committee on Club Stations, William H. Thomas, Henry H. Rogers, Cord Meyer, Augustus C. Tyler, Charles Lane Poor, Maximilian Agassiz, Harrison B. Moore, Henry C. Ward, William Lanman Bull, Edward R. Ladew.

A number of amendments to the constitution were passed, but must be approved at another meeting before they go into force. Among the amendments were changes for the number and dates of the meetings. It is proposed to hold the first meeting on the third Thursday of January; the second on the fourth Thursday of March; the third on the third Thursday of May; the fourth on the third Thursday of July; the fifth on the first Thursday of October, and the sixth on the third Thursday of December. The annual election will take place at the last meeting of the year.

The letter which Sir Thomas Lipton wrote to the club, in regard to another challenge, was referred to a committee of five to be appointed by the commodore.

The members voted resolutions of thanks to ex-Commodore J. Picrpont Morgan, owner of Columbia, and to the syndicates of Reliance and Constitution, and to Messrs E. D. Morgan, C. Oliver Iselin and August Belmont, who managed the three boats in last season's racing. To each syndicate member and each managing owner was presented a French clock. On the pendulum of each was a miniature America's Cup in silver.

Rear Commodore Cornelius Vanderbilt and Mr. C. L. F. Robinson each offered two cups for races over ocean courses.

Mr. F. M. Smith offered two cups for steam yacht races; one for boats over 110ft. waterline, and another for boats under 110ft., but over 75ft. waterline. Time allowance will be given in the races for both these cups.

Commodore Bourne offered two cups for races between high speed launches. The conditions governing these contests will be given out later.

The annual regatta will be held on Thursday, June 16.

The race for the Lysistrata cup between the steam yacht Hauoli, owned by Mr. F. M. Smith, and the Kanawha, owned by Mr. H. H. Rogers, the holder of the trophy, will take place just before or just after the June regatta of the club, off Sandy Hook.

A committee was appointed to draw up resolutions of condolence on the death of ex-Commodore E. M. Brown.

The report of the Regatta Committee is being printed, and a copy will be sent to each member.

Secretary George A. Cormack, in his report, stated that there were 1,616 active members in the club, and that the total membership is 2,021. The fleet numbers 517 vessels with a gross tonnage of 70,175.

The club's first house, on the Elysian Fields, Hoboken, will be removed to Glen Cove, on the property of Mr. Edward R. Ladew, and made one of the club's stations.

Twenty-two active and four naval members were elected.

At the annual meeting of the Independent Yacht and Boat Club, of Northport, L. I., which was recently held, the following officers were elected: Com., B. L. Sammis; Vice-Com., Elmer E. Skidmore; Treas., W. B. Warner; Sec'y, Thomas E. Davey; Trustees, B. L. Sammis, Elmer Skidmore, J. J. Fox, William Kissam and W. H. Barto.

## The Grosvenor Bill.

THE full text of the Grosvenor bill, to which the following correspondence refers, will be found on the first page of this issue, with our comments. The letter of Secretary MacLellan is important as setting forth the attitude of the American Power Boat Association:

NEW YORK, Jan. 9, 1904.—Honorable George B. Cortelyou, Secretary Department of Commerce and Labor, Washington, D. C.: DEAR SIR—As Secretary of the Committee on Legislation of the American Power Boat Association, I beg to ask if you will not kindly furnish me with information as to the status of proposed legislation affecting power boats propelled by gasoline, naphtha, electricity, etc.

My reason for writing you is that I am informed that the amendments suggested at the special meeting of the Board of Supervising Inspectors are in your hands and being prepared for introduction in Congress, and if consistent I would like very much to obtain a copy of same for the information of this committee.

In this connection I would say that this committee believes that all power boats should pass inspection on completion and delivery, and that power boats above five tons should be subject to an annual inspection.

We are also decidedly in favor of requiring an examination of those in charge of power boats, more particularly as to their qualifications and knowledge of navigation, sufficient for the safe and proper handling of such types of boats, but do not consider that such examination should call for a license such as is granted to captains and engineers, but rather a special form of certificate conforming to the examination which it may be decided is required.

We are emphatically against legislation requiring the employment of regularly licensed engineers aboard such types of boats, for the reason that the motors now in use are practically automatic and non-explosive, and in the majority of cases are directly controlled by the steersman, who, when examined for certification, should be required to prove his fitness in this direction also.

Any legislation detrimental to the development of the power boat must prove most unfortunate, not only because of the enormous labor and capital now represented in their production, but also because this type of boat has provided the man of moderate income with a means of navigation heretofore entirely beyond his reach. It has also proved to be a fact that the small boatman of to-day in many instances becomes the big boatman of tomorrow, and therefore the power boat will become a powerful factor in the future development of the steam yacht fleet.

I would very much appreciate any information you may care to give me on the above lines.

Yours very truly,

(Signed) E. M. MACLELLAN,  
Secretary.

DEPARTMENT OF COMMERCE AND LABOR. OFFICE OF THE SECRETARY, WASHINGTON, Jan. 20, 1904.—Mr. E. M. MacLellan, 90 Water Street, New York, N. Y.: DEAR SIR—The Department is in receipt of your letter of the 9th inst., requesting information as to the status of proposed legislation affecting power boats propelled by gasoline, naphtha, electricity, etc., and also asking to be furnished with a copy of the report of the Board of Supervising Inspectors regarding amendments to the present laws and regulations affecting the Steamboat Inspection Service.

The report above referred to is now before me, and is being carefully considered, and when a final determination is reached as to what action shall be taken thereon, your request will receive attention.

Respectfully,

(Signed) GEO. B. CORTELYOU,  
Secretary.

## YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

The annual meeting of the Bergen Beach Y. C. was held on February 8, and the following officers were elected: Com., Capt. A. F. Fuller; Vice-Com., C. R. Fitzmaurice; Treas., W. B. Lachicott; Fin. Sec'y, Clifford H. Eagle; Rec. Sec'y, Charles A. Gregory; Trustees, Retiring Com. George E. Fitzmaurice, Capt. G. S. Terry, J. A. Sutter, Sr.; Retiring Treas. Ed. Chapman, George T. Byers.

The first exhibition of power boats to be held in this city was opened on February 8, at the Herald Square Exhibition Hall, northwest corner of Broadway and Thirty-fourth street. The exhibition is still open, and there are a number of launches and motors on show.

Captain J. J. Phelps, of Hackensack, N. J., is having a high speed launch built by Messrs Wyckoff Bros., of Clinton, Conn., from designs made by Mr. Charles B. Wyckoff. The boat is 43ft. over all; 41ft. waterline; 6ft. breadth at deck; 4ft. 10in. breadth at waterline; and 6in. draft. The boat will be double planked, the outer skin being of mahogany. She will be fitted with a six-cylinder Hasbrouck motor, and the builders guarantee a speed of 20 miles.

The annual meeting of the Shelburne (N. S.) Y. C. was held on the evening of January 27, and the following officers were elected: Com., R. G. Hervey; Vice-Com., H. W. Freeman; Rear-Com., J. Etherington; Treas., J. J. Cox; Sec'y, T. Walter Magee. Executive Committee, the Commodore, Vice-Commodore, Rear-Commodore, Secretary, N. W. White, J. S. Morton, Joseph McGill, S. W. Burns and E. M. Bill. Committee on Membership, John Hood, Winthrop Bower, Frank C. Blanchard, T. Walter Magee and Roland Moore. Regatta and Sailing Committee, to be appointed by the Executive Committee.

The committee that was appointed to look into the building of a club house submitted its report, which proved very satisfactory. The plans called for a club house 40ft. wide and 70ft. long, with an extension 16ft.

by 40ft., which will contain an office and reception rooms for the members and their guests. On the front of the club house there will be a large piazza 14ft. long, which will extend over the water. In the main room of the club house there will be a movable stage 18ft. by 40ft. for concerts and plays. In connection with the club house there is to be a boat house 40ft. by 70ft. which will be used for the storage of tenders, spars, sails, etc. The Executive Committee will endeavor to secure the erection of the building in time for the coming summer's regatta.

Mr. W. W. Stephens has purchased the auxiliary sloop Marianna from Mr. Charles A. Winter through the agency of Mr. Stanley M. Seaman.

The annual meeting of the Canarsie Y. C. was held on February 14, and the following officers were elected: Com., T. H. Northridge; Vice-Com., W. Lounsberry; Sec'y, W. W. Tamlyn; Fin. Sec'y, George E. Winters; Treas., J. K. Alexander; Meas., A. C. Dunlap; Board of Trustees, G. F. Kalkhoff, D. J. Brinsley, Jr.; C. J. Nielsen, W. G. Herx, T. M. Mannion, C. A. Martin and Joseph B. Acker.

The annual meeting of the Hartford Y. C. was held on the evening of February 11, at the Hotel Heublein, Hartford, Conn., and the following officers were elected: Com., Louis F. Heublein; Vice-Com., Charles A. Goodwin; Rear-Com., Walter S. Schutz; Sec'y, Joseph Merritt; Treas., E. Hart Fenn; Meas., Harry D. Olmsted; Fleet Surgeon, J. F. Axtelle, M.D.; Trustees, John MacFadyen and E. N. Way. Race Committee, John E. Stewart, Chairman; Montague Flagg, A. E. Chappell, Charles A. Goodwin, John MacFadyen, Charles B. Wyckoff. Delegates to Y. R. A., John E. Stewart, Chairman; Walter Pearce, Charles B. Wyckoff, Gerald W. Hart.

Dr. S. H. Blodgett, of Boston, has purchased the schooner Atlanta through Messrs MacConnell Bros.

Howard W. Coates, a member of the New York, Larchmont and Atlantic Y. Cs., died of pneumonia on February 10.

At Huntington's yard, New Rochelle, there is building a speed launch from designs made by Mr. Ernest W. Graef of the Brooklyn Y. C. She is to be 30ft. over all, 4ft. breadth and 18in. draft. She will be named Dolphin II., and is very similar in design to the first Dolphin that Mr. Huntington built last year for Mr. Graef.

Messrs Tams, Lemoine and Crane have gotten out plans for a 50ft. launch for Mr. M. Charley. The boat will be fitted with a 200 horse-power Mercedes motor.

The Townsend & Downey shipbuilding plant, at Shooter's Island, S. I., was closed for the second time in two months on February 5. No warning was given to the 700 men employed there. The only yacht building at the yard is the bronze schooner for Mr. Chester A. Chapin.

The annual meeting of the Atlantic Y. C. was held on the evening of February 7, at the New York Y. C., Thirty-fifth street and Fifth avenue, and the following officers were elected: Com., Harrison B. Moor, steam yacht Zara; Vice-Com., F. D. Underwood, steam yacht Alice; Rear-Com., E. B. Havens, sloop yacht Athlon; Treas., C. T. Pierce; Sec'y, T. Alfred Vernon; Meas., Henry J. Gielow. Regatta Committee, Henry A. Gielow, Frederick Vilmar and W. A. Minott. Membership Committee, George D. Provost, Walter H. Nelson and F. J. Havens. Library Committee, F. T. Cornell, Hendon Chubb and J. E. Beggs. Entertainment Committee, S. E. Vernon, George G. McIntosh and Joseph Scranton. Nominating Committee, E. B. Havens, H. G. S. Noble, W. L. Pettibone, George D. Provost, H. B. Chamberlain and Paul D. Barnard. Trustees, to serve for one year, Edwin Gould and J. Rogers Maxwell; to serve for two years, Harrison K. Smith and Spencer Swain; to serve for three years, Robert E. Tod and Alfred W. Booth.

Commodore Moore is in Mexico, and Vice-Commodore F. D. Underwood presided. The club is in splendid condition as was shown by the reports of the officers and committees. The following amendments to the racing rules were passed upon:

Rule IV., under sloops and yawls, strike out paragraph commencing, Class R. 18ft. or less, etc., and substitute:

Class R.—Over 15ft., not over 18ft., racing measurement; crew, two persons.

Class RR.—15ft. or less, racing measurement; crew, two persons.

In the second sentence in section 3, of Rule IV., strike out the word 150, and substitute 175, so that this sentence will read: Their average weight must not exceed 175 pounds.

The steam yacht Uno, built last year for Gen. B. F. Whitlock, by the Marine Drydock & Construction Co., is to be cut in two and lengthened about 18ft. amidships. When the alterations are completed she will be about 95ft. over all.

At Hallock's yard, Center Moriches, L. I., there is building a racing boat for Mr. T. A. Howell of the Shinnecock and Indian Harbor Y. C. She will be 30ft. over all; 7ft. 6in. breadth, and 2ft. draft. Her sail area is to be 460 sq. ft.

The annual meeting of the Brooklyn Y. C. was held

at the Clarendon Hotel, Brooklyn, on the evening of February 10. The following officers were unanimously elected: Com., Samuel S. Fountain; Vice-Com., John C. Abbey; Rear-Com., A. C. Soper; Treas., Willard Graham; Sec'y, Charles A. Kelly; Meas., G. Curtis Gillespie. Trustees, for three years, C. H. Humphreys, George E. Reinert, W. W. Butcher; for two years, Arthur T. Wells; for one year, W. Newton Bennington. Regatta Committee, D. G. Whitlock, John A. Donnelly, Charles E. Allen. Committee on Membership, N. T. Cory, J. A. Sutter, Jr.; William Maxwell. Committee on Nominations, Walter D. Haviland, A. B. Voorhees, Jr., M. J. Hanly.

The new rating rules of the Atlantic Y. C. were adopted with the proviso that the measurement of some of the older craft be left to the regatta committee.

When the Brooklyn Y. C. consolidated with the Gravesend Bay Y. C., three years ago, they adopted the burgee of the latter club. The Brooklyn Y. C. is the second oldest yachting organization in this country, and some of the members wanted to go back to the old flag that was in use from 1857 to 1900. This proposition was defeated and the Gravesend Bay Y. C. burgee will remain in use.

The club is in an excellent condition, and a large increase in membership is looked for during the coming year.

The Motor Boat Committee of the Automobile Club of America, which is made up of Messrs. W. K. Vanderbilt, Jr.; Peter Cooper Hewitt and Colonel John Jacob Astor has announced that an entry has been officially made with the Automobile Club of Great Britain and Ireland, for the Harmsworth International Cup for motor boats.

The boat which will represent America in this race is entered by Smith & Mabley. There is no restriction as to horse power, and the only qualification is that the boat shall be constructed in all its parts in this country and shall not exceed 40ft. over all. It will be equipped with an "S. & M." simplex engine.

A motor boat race is to be held on Lake Worth, near Palm Beach, shortly. Cups valued at \$500 have been offered by Messrs Howard Gould, A. D. Proctor Smith and Frederick Sterry. The boats will be brought from Jacksonville to Lake Worth on flat cars. They will race a ten mile course.

## Designing Competition.

\$225 in Prizes.

Two designing competitions have been given in FOREST AND STREAM. The first was for a 25ft. waterline cruiser; the second was for a 15ft. one-design class. Both competitions were very successful. The great interest taken in those competitions has prompted us to give a third one, open to amateurs and professionals. The prizes which will be given are as follows:

First prize—\$100.

Second prize—\$60.

Third prize—\$40.

Fourth prize—\$25, offered by Mr. Theodore Zerega for the best interior plan.

The designs are for a yacht conforming to the following conditions:

I. Centerboard cruiser, 40ft. l. w. l.

II. Boat must not draw over 6ft with centerboard up.

III. The lowest freeboard to covering board must be 3ft.

The design must be modern in every particular, without containing any extreme or abnormal features. The conditions have been made as simple as possible; that competitors might have all latitude and scope in working out their ideas. We wish to produce an able and comfortable cruising boat, one that shall have ample accommodation for two or three men living aboard for a period of several months, and one that can be easily managed at all times by two or three paid hands. The draft is restricted to 6ft. in order that the boat may have access to nearly all the desirable harbors, and may, thereby, widely increase her cruising field.

### Drawings Required.

I. Sheer plan, scale  $\frac{3}{4}$ in.=1ft.—showing center of buoyancy, center of lateral resistance and center of effort of both rigs.

II. Half breadth, scale  $\frac{3}{4}$ in.=1ft.

III. Body plan, scale  $\frac{3}{4}$ in.=1ft.

IV. Cabin plan, inboard profile and at least one cross section, scale  $\frac{3}{4}$ in.=1ft.

V. Two sail plans, scale  $\frac{1}{4}$ in.=1ft.; one as a yawl; one as a pole mast sloop.

In the case of the yawl rig the position and height of the mast and length of gaff are to be the same as in the cutter rig. Plans must show working topsail and size of light sails.

VI. All ballast outside on keel except amount necessary for trimming.

An outline specification must accompany each design. The drawings should be carefully made and lettered. All drawings should be on white paper or tracing cloth in black ink. No colored inks or pigments should be used. The designs must bear a nom-de-plume only, and no indication must be given of the author. In a sealed envelope, however, the designer must inclose his own name and address, together with his nom-de-plume. All designs must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York City, not later than March 1, 1904. All drawings will be returned, but postage should accompany each.

The FOREST AND STREAM reserves the right to publish any or all of the designs.

Mr. Clinton H. Crane, of the firm of Messrs. Tams, Lemoine & Crane, who passed upon the designs submitted for the 25ft. with great care, has again consented to judge the designs and make the awards.

### Officers of A. C. A., 1904.

Commodore—C. F. Wolters, 14 Main St. E., Rochester, N. Y.  
Secretary-Treasurer—John Sears Wright, 519 West End Ave., Rochester, N. Y.

#### ATLANTIC DIVISION.

Vice-Commodore—L. C. Kretzmer, L. C. Schepp Building, New York.  
Rear-Commodore—W. A. Furman, 846 Berkeley Ave., Trenton, N. J.  
Purser—M. Ohlmeyer, Jr., 201 Palisade Ave., West Hoboken, N. J.  
Executive Committee—H. L. Pollard, 138 Front St., New York;  
N. S. Hyatt, Ossining, N. Y.; H. C. Allen, 54 Prospect St., Trenton, N. J.  
Board of Governors—R. J. Wilkin, 26 Court St., Brooklyn, N. Y.  
Racing Board—H. L. Quick, Yonkers, N. Y.

#### CENTRAL DIVISION.

Vice-Commodore—H. W. Breitenstein, 511 Market St., Pittsburg, Pa.  
Rear-Commodore—H. C. Hoyt, 164 Crescent Ave., Buffalo, N. Y.  
Purser—Frank C. Demmler, 526 Smithfield St., Pittsburg, Pa.  
Executive Committee—Jesse J. Armstrong, Rome, N. Y.; John S. Wright, 519 West Ave., Rochester, N. Y.  
Board of Governors—C. P. Forbush, 14 Main St., East, Rochester, N. Y.  
Racing Board—Harry M. Stewart, 85 Main St., East, Rochester, N. Y.

#### EASTERN DIVISION.

Vice-Commodore—Henri Schaeffer, Manchester, N. H.  
Rear-Commodore—H. M. S. Aiken, 45 Milk St., Boston, Mass.  
Purser, Edw. B. Stearns, Manchester, N. H.  
Executive Committee—B. F. Jacobs, Jr., West Medford, Mass.; D. S. Pratt, Jr., Wellesley Hills, Mass.; Marcus Butler, Lawrence, Mass.; William W. Crosby, Woburn, Mass.  
Board of Governors—Paul Butler, U. S. Cartridge Co., Lowell, Mass.  
Racing Board—Paul Butler, U. S. Cartridge Co., Lowell, Mass.; H. D. Murphy, alternate.

#### NORTHERN DIVISION.

Vice-Commodore—Chas. W. McLean, 303 St. James St., Montreal, Canada.  
Rear-Commodore—Wm. Sparrow, Toronto.  
Purser—J. V. Nutter, Montreal, Canada.  
Executive Committee—C. E. Britton, Gananoque, Ont.; Harry Page, Toronto.  
Board of Governors—J. N. MacKendrick, Galt, Ont.  
Racing Board—E. J. Minet, Montreal, Canada.

#### WESTERN DIVISION.

Vice-Commodore—Burton D. Munhall, care of Brooks Household Art Co., Cleveland, O.  
Rear-Commodore—Chas. J. Stedman, National Lafayette Bank, Cincinnati, O.  
Purser—Geo. A. Hall, care of Bank of Commerce, Cleveland, O.  
Executive Committee—Thos. P. Eckert, 31 West Court St., Cincinnati, O.; Dr. H. L. Frost, 10 Howard St., Cleveland, O.  
Board of Governors—Henry C. Morse, Peoria, Ill.

### How to Join the A. C. A.

From Chapter I., Section 1, of the by-laws of the A. C. A.:  
"Application for membership shall be made to the Division Purser, and shall be accompanied by the recommendation of an active member and by the sum of two dollars, one dollar as entrance fee and one dollar as dues for the current year, to be refunded in case of non-election of the applicant."

## The Shenandoahs Cruise the Greenbrier.

BY F. R. WEBB ("COMMODORE"), OF STAUNTON, VIRGINIA.

The Story Which Won the Fourth Prize of \$10 in "Forest and Stream" Cruising Competition.

### I.—Pro Log.

THE afternoon sun was getting well down towards the summit of Cheat Mountain, whose gigantic crest loomed up in a towering wall across the western horizon in front of us, as our tired horses topped the range to the east, and the Greenbrier Valley lay below us. George and I sprang from the wagon, as the panting horses stopped for a short time to "blow" and rest, and essayed to get a glimpse into the valley below. The gorge looked fathomless from our standpoint. The sun had already set in the depths below, and the shadow lay purple and heavy under the frowning ramparts of Cheat. The densely wooded mountain slope at our feet seemed almost perpendicular, and from no point of view could we get a glimpse of the bottom. Far down under our feet smoke was rising from the stacks of the great lumber mill at Cass, our destination, and jets of steam curled up in feathery plumes from among the treetops in the bottom of the chasm a thousand feet below us, while the whistle of a railroad engine, faint and far away, came to our ears, mellowed and musical, from somewhere out of the depths below. The sandy, rocky road zigzagged steeply down the almost perpendicular mountain, which rose in an abrupt, tree-clothed wall on one side, and fell away in a frowzy precipice on the other, the while we bumped and rattled our uncomfortable and decidedly shaky way down into the gorge. It seemed as if that chasm had no bottom, but in due time the still, lake-like waters of the mill pond glimmered up at us through the trees, the 15ft. dam shimmered in the twilight, its apron, sides and ends lined with fishermen in pursuit of the bass supposed to congregate at the foot of the impassable barrier; and in a few minutes more we were drawn up in the straggling little wooden lumber village, prospecting for a site for camp, which was duly found, and we were soon comfortable for the next few days.

For a great many years the Greenbrier Club, of Staunton, has made its annual pilgrimages to the far upper waters of the stream from which it derives its name in

pursuit of trout; the pilgrimages generally proving quite satisfactory, to say nothing of the beautiful two days' trip over the mountains to get there; and from the time of our first trip George and I have been possessed with a desire to get our canoes out there and cruise the river from the point where the East and West Forks (the "Near" and "Far Prongs" as they are locally known) unite, a few miles below our camp; but, as it is 75 miles out there from Staunton, which is (or was) also the nearest railroad station, our project seemed chimerical, until all at once the Chesapeake and Ohio Railroad Company built a road right up along the banks of the river from Ronceverte to this very point, where, in the forks of the river, they located a promising town known as Durbin (which, like Mr. Scadder's Eden, has not been all built up yet), which at once made our visionary plan entirely practical. This year, therefore, we had shipped our canoes and cruising outfit around by rail to Durbin, the while we joined the club for our annual pilgrimage. We had been at Camp Cooke—our regular camping place on Van Buren Arbogast's farm on the "Near Prong," a few miles above Durbin—for a week, and had caught all the trout in the river, after which we had packed up and gone up on Cheat Mountain, and spent a night on Cheat River, that remarkable river that runs along right on top of a 4,000ft. mountain, where we met with no success, some other party having evidently caught all the trout out of this stream; and had then returned to the Greenbrier and driven down the country and crossed back into its valley at Cass, 15 miles below the confluence of the two forks at Durbin, at which point, as already intimated, there is a lumber mill and a 15ft. dam, which, since it forms a barrier ordinarily impassable to the ascent of the bass, had been recommended to us as a fine fishing place. As this is not a history of the doing of the Greenbrier Club, no further time and space will be devoted to its doings, further than to state that we stayed at Cass for four or five days, and enjoyed some really excellent fishing, and that on a certain June morning, and very early in the morning at that, the camp was broken and packed and the return trip overland to Staunton was begun. George and I were left standing on the river bank while the rest of the party, after cordial good-bys and good wishes for our adventurous and unknown cruise, laboriously climbed the mountain on their homeward trip, and were lost to sight. In due time a passenger train came spinning along up the river bank, and George and I were promptly and easily set back up the river 15 miles to Durbin, from which place we proposed to begin our cruise; and where we found our canoes and outfit safely lying in the freight house, and very much at our disposal.

After preliminary survey of the banks of the Near Prong, which ran but 100 yards back of the freight station, an eligible site for camp was located, about a mile above the confluence of the two forks, and the canoes and duffle transferred to the bank. We made no start on this first day, but erected our tents over the canoes and went into camp, and the afternoon was devoted to unpacking the camp outfit, and sorting, repacking and otherwise arranging our outfit for what we fully expected would prove an arduous cruise, for the average mountain stream is no joke; and, as our United States Geological Survey map of the river, with which we were provided, has its 100 foot contour lines crossing the river at an average distance of about 10 miles (with some few in a much less distance than that), we had every reason to expect a tolerably lively trip. It will be the duty of the veracious chronicler of this narrative to show that this expectation was fully verified.

We did our sorting and packing leisurely and carefully, and in due time everything was in readiness for the morrow's start. We had a good hearty camp supper, and after a pleasant evening around a little blaze of a camp-fire—for the evening was quite chill—we turned in for an early morning's start.

The Greenbrier River lies wholly in West Virginia, and is formed in the extreme upper end of Pocahontas county, by the union of two small streams known as the East and West Forks; or, as they are termed in local parlance, the Near and the Far Prongs, both of which have their sources in the trackless wilderness of mountain land that lies along the hazy boundary between Pocahontas and Randolph counties. The river pursues a general southwesterly course of about 90 miles between the mountain ranges, in which distance it develops a winding length of 165 miles, and falls into the New River just above Hinton, flowing through the counties of Pocahontas, Greenbrier and Summers, and just touching the upper corner of Monroe, which county it divides from Greenbrier for about 3 miles. With its tributaries (none of which are of any considerable size) it drains the rather considerable valley bounded on the east by the giant backbone range of the Alleghany mountain, and on the west by the equally gigantic ranges of the Cheat and Greenbrier mountains; the actual valley of the river, however, is very narrow and circumscribed; the river being closely hemmed in by ranges and foothills, "ridges," as they are locally termed, which impinge so closely on the river that in many places the valley becomes a mere gorge or trough, of great depth, at the bottom of which the river winds its sinuous course in and out among the mountain spurs, which rise steeply from the water's

edge, sometimes to a great height, on either side. The scenery is therefore, as a rule, quite wild and picturesque. The mountains are densely wooded to their summits, with here and there lines of cliffs projecting from among the trees, or towering aloft along the summits above the treetops. The river is a bold, swift stream, with an average fall of 10 feet to the mile; and, as a consequence, is full of rapids, which, however, occur in such constant succession, with no pools or eddies of any length between them, that none of them offer any particular difficulty or danger to the experienced canoeist. About 25 miles below Marlinton the river cuts through the Droop mountain range, and probably the roughest water on the river is found in this gorge. Its waters are very clear, and of a beautiful amber tint in its upper reaches, changing to a slaty blue farther down. The two upper prongs are noted trout streams; and although the West Branch, or Far Prong has been practically fished out for some years, the East Branch or Near Prong still affords good fishing, not too late in the season, and is much visited by anglers in search of sport of this character. Below the junction of the two forks no trout are found, except occasionally quite early in the season, although this section of the stream still preserves its characteristic trout-stream features. Bass begin to appear in this section of the river; and, indeed, are found in the lower reaches of the two "prongs," but are not found in any numbers above the big dam at Cass, 15 miles below the confluence of the two prongs. There is a trout hatchery on Anthony's creek, about 90 miles down the river from the confluence, but it would be difficult to see how the trout could pass the dam at Cass. There is a technical fish ladder in this dam, but owing to the peculiar construction of both the dam and the ladder, to say nothing of the height of the dam, it would take a peculiarly agile and well educated trout to make a success of the ladder.

As a cruising stream the Greenbrier can be highly recommended. It combines to an unusual degree the qualities a good cruising stream should have: a small, rapid river, flowing through wild mountain scenery, full of rapids, which, while swift and rough enough to be exciting are in nowise dangerous; absolutely free from fish dams, and practically so from mill dams; for the only dams encountered on the cruise were the ones at Cass, Caldwell and Ronceverte; and I do not think that there are any dams below Ronceverte. The dam at Caldwell is so low as to present practically no obstacle, and canoes can go right over it at a fair stage of water. A healthful climate, free from malaria and mosquitoes; railroad facilities immediately at hand; farmhouses, railroad stations and villages close enough at hand to insure a renewal of supplies without special difficulty; a simple, rural, well disposed population, ready to render any needed assistance for the asking, and prompt to respond to any reasonable demands of the cruising stranger. It is a stream, however, that cannot be cruised at an extreme low stage of water, as most of the rapids or "riffles" spread out over wide, shallow bars that will not afford water enough to float even the lightest draft canoe. A stage of from 6 to 12 inches above extreme low water mark will afford a favorable stage for cruising; and while I make this statement without consulting him I am confident that Dr. Norman Price, of Marlinton, Pocahontas county, West Virginia, will readily give information as to the stage of water, as well as of other points of interest desired by the canoeists wishing to cruise the stream.

Canoeists are advised not to cruise the river between Durbin and Cass, as, while the stream is beautiful and interesting in this reach, the difficulties of running it entirely outweigh the satisfaction to be gained. Marlinton, 40 miles below Durbin, is probably the best point from which to start, although the canoeist might well begin at Clover Lick or even at Cass; and the entire river, from these points through to Hinton will repay the running. There is said to be some quite rough water in the big bend between Talcott and Hinton, but as our cruise ended at Ronceverte, we did not run this lower section of the river, and I can tell nothing of the water from personal knowledge.

No attempt is made on the map to show all of the rapids, or anything like all of them, as they occur so constantly that practically the entire river is a rapid, and only those of greater note are indicated. No special instructions are needed, as the river is so small that the most available channels down the rapids will be at once apparent to the eye of the experienced cruiser. As a general rule, it is safe, when the rapids occur alongside the railroad embankment, to keep out as far from the railroad as the water will allow, as in blasting out the road bed, huge masses of rock have been unceremoniously tumbled into the river, and generally lie up next to the roadway; this rule is particularly applicable to those rapids which occur in sharp bends, where the river impinges into the roadway.

The figures on the map refer to the miles. The map is taken from the latest United States Geological Survey charts.

Our outfit has been so often described in the various accounts of our Shenandoah cruises, published from time to time in the columns of FOREST AND STREAM,

that it would seem but useless repetition to again describe it here; but as it is so well adapted for this kind of work, being the result of many years' experience, and as there may be readers who have not seen the descriptions heretofore published, I will give it again, even at the risk of useless repetition: The canoes, Frankie and Shenandoah, are canvas canoes of home construction, built on the Shenandoah model—a model especially designed for just such cruising. The Frankie is a new canoe, while the Shenandoah is a veteran of many cruises. Both are 14ft. long by 28in. beam, with full lines and flat floors, combining light draft with plenty of sleeping and stowage room (for the Shenandoahs sleep in their canoes), qualities indispensable in canoes intended for this kind of service. Both are well cut away at bow and stern, with broad, flat keels and plenty of bilge-keels to protect the canvas skins from injury. Both were decked canoes, with cockpits 8ft. in length, by 20in. width amidships; the cockpits covered by hatches, with an oiled canvas apron covering the space immediately in front of, and around the occupant. Each was propelled by a double bladed paddle 7½ft. long. The draft of each canoe, when loaded with crew and camp duffle, was 5½in. The camp equipment consisted of a canoe tent for each boat, of the Mohican pattern, constructed out of awning duck of a tasty blue and white pattern, the oblong tops being of white duck. Each tent was a little over 8ft. long at the bottom, so as to cover the entire open cockpit, and 5ft. long on top. As we carried no masts and sails, the tents were erected over the canoes by means of light pine standards, one at each end, a little higher than the tent; each standard consisting of two light pieces of pine bolted together at one end, the other spreading out like the points of a pair of compasses, and resting on cleats screwed on the gunwales or fenders on each side of the canoe fore and aft the cockpit. The tent ropes are made fast to the bow and stern painter rings and carried over these standards, resting in the notched tops, while the lower edges of the tents are made fast to screweyes, set in the under edges of the fender strips. The method is quick, simple and secure. Each canoe was provided with a small hair mattress, 5ft. long by 18in. wide, made in three cushions, the edges of which are fastened together, so as to facilitate folding for packing. In transit each mattress is slipped into an oiled canvas bag, and serves as a seat in cruising. An air pillow, a pair of blankets and a stout rubber sheet apiece, completed the sleeping outfits. The culinary outfit consisted of a small sheet iron camp stove, in the shape of an oblong bottomless box about a foot and a half long, a foot wide and half as deep. When in action the open side is placed on the ground, the fire being made directly on the ground. The top is provided with two stove holes of the regulation size, fitted with lids, riveted at one side, so as to slide off and on as desired. A door at one end affords access for fuel, while a collar at the other end is fitted with two joints of 3-inch pipe, one of which is an elbow. When not in use the stove is inverted and used as a packing box, in which the rest of the kitchen furniture is stowed, nested; consisting of large water pail, one or two frying pans, according to the number of persons in the party, fitted with detachable handles, stewpan, dishpan, smaller pail, tea kettle, coffee pot, several small pans, tin plates, several cups, soap box, coal-oil can, dish swab, stove-pipe and other miscellaneous articles. A mess chest—a light poplar box about the size of the camp stove—contained tin cans of coffee, sugar, butter, lard, flour, salt, etc., with the knives, forks, spoons and granite-ware plate of the party, together with enough eatables in the way of biscuits, butter, canned goods, etc., for the noonday lunch each day. A light fly, of striped awning cloth, similar to that used in the construction of the tents, was carried, and erected over the mess table in rainy weather; the bamboo pike poles carried by each canoe serving as tent poles (while disclaiming any desire to impinge upon the Red God controversy, I will state that these canoe poles were "iron shod," and that the "click" when in action was quite audible, whether around the bend or this side of it), while a folding ridge pole was stowed in one of the canoes. A mess table was improvised at each camp by mounting a midship hatch on four pins, made of old buggy spokes, which were fitted with cleaves at the top, through which were slipped a couple of light pine strips, on which the hatch rested. We found it worth while to carry our pins for mess table and fly. Nothing makes better tent pins than old buggy spokes, shortened and sharpened at one end.

The expeditionary supplies were as follows: The list lasting us through two weeks' cruise, with the exception of the sugar and bacon, each of which had to be renewed. It is impossible to get the regular breakfast bacon at the average country store, so in laying in supplies it is best to take enough of this staple article at the start, as well as enough coffee and canned goods. Good sugar can be procured at any country store, and butter, lard and eggs can be renewed at any farmhouse or store. 3lbs. best Java and Mocha coffee, ground rather fine, 2½lbs. granulated sugar, two 5lb. pieces breakfast bacon, one 3 lb. bucket lard, 1 lb. butter, 3 doz. eggs, 1 peck potatoes, 5 doz. biscuits, 3 doz. beaten biscuits, 1 pkg. Uneda biscuits, ½ peck cornmeal, 1 qt. flour, ½gal. onions, 1lb. cheese, 1 box matches, ½pt. salt, 1 bot. pepper, 2 doz. lemons, 2 doz. short paraffine candles, 1 bar of kitchen soap, ½gal. coal-oil, 1 pkg. ginger snaps, 1 pkg. tinned crackers, 3 cans Vienna sausage, 3 sausage and tomato sauce, 2 cans sardines, 2 cans chipped beef, 3 cans devilled ham, 3 cans boned turkey, 2 cans soups (thick varieties, mock turtle or oxtail preferred), 2 cans succotash, 6 cans pork and beans, 1 can shrimps, 1 devilled lobster, 2 bottles pimolas.

Our clothing outfit included one full suit woolen goods (without vest), two pairs wading pants of cotton over-all stuff, cut down into knee trousers, with long bicycle stockings; canvas wading shoes, heavily hobnailed. George, who had recently had a severe attack of sciatica, and was consequently afraid of the water, wore a heavy pair of silesian waders over his short trousers throughout this cruise. Two outing shirts, one outing shirt for dress purposes, three suits of underwear, three pairs of socks, six handkerchiefs, six towels, shaving materials, brush, comb, toothbrush; rubber coat and short rubber cape

for use in the canoe; bamboo helmet with rubber cover made to order to fit over helmet for rainy weather; soft hat for use around camp, and a miscellaneous collection of small odds and ends for various uses that might arise, such as needles, thread, etc., including a few simple remedies, such as quinine, arnica, witchhazel, liniment, etc.

I had with me one convenience which I found of peculiar value on this cruise, with its cold nights: it was a voluminous wrap or kimona made from a good, heavy red blanket, in which I wrapped myself from head to foot when turning in for the night. It possessed all the advantages of an extra pair of blankets, as it was underneath as well as over me, and was exceedingly comfortable of an evening around the camp-fire.

[TO BE CONCLUDED.]

## Rifle Range and Gallery.

### Fixtures.

Feb. 27-March 5.—New York.—At Zettler's, championship rifle gallery tournament.  
June 12-20.—National Schuetzenbund Festival, Union Hill, Schuetzen Park, N. J.

### United States Revolver Association.

THE annual indoor championship matches of the United States Revolver Association will be conducted in Boston, New York, Springfield, Chicago, St. Louis and San Francisco.

In New York City the matches will be held under the auspices of the Manhattan Rifle and Revolver Association, at the gallery, 2628 Broadway, near 100th street. This gallery will be open for practice and for match shooting on the evenings of Feb. 25, 26 and 27 and March 3, 4 and 5. These matches are open to all, the conditions being as follows:

Indoor Revolver Championship.—Open to everybody; distance 20yds.; 50 shots on the Standard American target, reduced so that the 8-ring is 2.72in. in diameter. Arm, any revolver. Ammunition, any suitable smokeless gallery charge approved by the executive committee. The score must be completed in one hour or less from the time of firing the first shot. Entrance fee, \$5; no re-entries.

Prizes.—First, a silver cup, to be held until the next annual competition, the cup to become the property of the competitor winning it three times; second, a silver medal; third a bronze medal. A bronze medal will also be awarded to any competitor, not a prize winner, making a score of 425 or better.

In 1901 first prize was won by W. E. Petty on a score of 439; second, J. A. Dietz, Jr., 439; third, R. H. Sayre, 433.

In 1902, first prize was won by W. E. Petty, on a score of 439; second, R. H. Sayre, 436; third, A. L. A. Himmelwright, 428.

In 1903, first prize was won by Wm. H. Luckett, on a score of 437; second, J. A. Dietz, Jr., 434; third, W. A. Smith, 427.

Indoor Pistol Championship.—Open to everybody; distance 20yds.; 50 shots on the Standard American target, reduced so that the 8-ring is 2.72in. in diameter. Arm, any pistol. Ammunition, any suitable smokeless gallery charge approved by the executive committee. Black powder ammunition allowed in .22cal. pistols. The score must be completed in one hour or less from the time of firing the first shot. Entrance fee, \$5; no re-entries.

Prizes.—First, a silver cup, to be held until the next annual competition, the cup to become the property of the competitor winning it three times; second, a silver medal; third a bronze medal. A bronze medal will also be awarded to any competitor, not a prize winner, making a score of 435 or better.

In 1901 first prize was won by R. H. Sayre, with a score of 433; second, J. A. Dietz, Jr., 429; third, J. B. Crabtree, 427.

In 1902, first prize was won by R. H. Sayre, on a score of 448; second, J. A. Dietz, Jr., 428; third, A. L. A. Himmelwright, 408.

In 1903, first prize was won by T. Alderton, on a score of 460; second prize, J. A. Dietz, Jr., 456; third, R. H. Sayre, 446.

For further details and information, address J. E. Silliman, care of the Manhattan Rifle and Revolver Association, 2628 Broadway, New York city.

### New York Schuetzen Corps.

SEVENTY-TWO members of the New York Corps were in attendance at the bi-monthly shoot in the Zettler gallery on Feb. 12.

The contest this winter has brought out a larger number of members than in any year since the corps was organized. The interest of the members in the welfare of the corps was exemplified at the corps' annual ball, held a few days since, when 200 members were present in uniform. The corps' new captain, John H. Hainhorst, starts out as commander of the corps under conditions highly satisfactory to himself and to his corps members. This corps, which is probably the oldest organized German-American shooting society in America, has always taken the lead in the affairs of our local societies. At the present time the membership is about four hundred, and its treasury carries a credit balance of about \$5,000.

In the night's shooting on the ring target, R. Gute again was high, with 245 and 246. On the bullseye target J. N. F. Siebs made the best center shot; R. Gute was second. The special prize, an arm chair, went to Gute, Siebs being ineligible.

Ten-shot scores, 25-ring target, distance 75ft.: R. Gute 245, 246; O. Schwanermann 232, 243; B. Zettler 233, 238; J. C. Bonn 223, 238; H. B. Michaelson 229, 227; A. W. Lemcke 225, 228; J. N. Siebs 224, 228; G. Thomas 227, 228; D. Peper 219, 233; H. D. Meyer 229, 221; J. Jantzen 226, 224; J. H. Doscher 220, 229; W. Schultz 225, 225; C. Schmitz 216, 229; C. Wahman 220, 227; Y. C. Hagenau 228, 220; H. Beckmann 230, 217; Geo. Offermann 219, 227; H. Haase 229, 225; H. Gobber 225, 225; C. Konig 210, 232; H. Rottger 219, 215; H. R. Coplan 221, 215; H. Decker 214, 218; A. Evers 227, 213; H. C. Hainhorst 213, 232; J. H. Hainhorst 225, 227; P. Heidelberger 224, 215; H. Koster 221, 212; Herman Koster 221, 211; G. Junge 213, 212; M. J. Then 220, 206; C. Mann 214, 210; H. Offermann 208, 220; C. Roffmann 228, 197; F. Schultz 207, 219; H. Winter 214, 209; F. Facompre 216, 225; C. Brinckama 224, 207; J. H. Meyer 218, 216; H. Nordbruch 224, 212; J. Poradies 209, 212; N. C. L. Beversten 209, 219; W. Dahl 210, 213; F. Feldhusen 216, 213; H. Konig 204, 214; J. C. Krush 218, 196; J. G. Tholke 202, 220; W. Schaefer 219, 198; D. H. Brinckmann 199, 216; J. C. Brinckmann 192, 200; Adolph Beckmann 200, 191; M. Von Dwingelo 198, 191; D. Von Glahn 201, 192; H. Heinecke 201, 214; H. Horenberger 193, 196; H. D. Von Hein 199, 206; J. G. Voss 207, 207; E. F. Lankenau 186, 209; D. Von der Lieth 182, 215; A. Lederhaus 202, 183; H. Quinten 180, 216; N. Jantzen 188, 199; J. Gobber 189, 196; N. W. Haaren 193, 185; H. Meyn 178, 209; H. Haaren 152, 191; B. Kumm 139, 126; Gus Hagenau 196, 178; J. C. Degenhardt 175, 169; R. Ohms 143, 173; D. Ficken 198, 171.

Bullseye target, 4in. carton, the best center shot to count, by measurement: J. N. F. Siebs 43½ degrees, R. Gute 46½, O. Schwanermann 47, P. Heidelberger 50, W. Dahl 52½, C. Schmitz 67½, H. Meyn 69½, F. Facompre 72½, C. Konig 73½, J. H. Hainhorst 74, A. Beckmann 77½, L. C. Hagenau 81, N. W. Haaren 82½, H. B. Michaelson 83½, D. Von Glahn 92½, D. Ficken 95, A. Evers 96½, W. Schaefer 96½, H. Beckmann 99, H. Harms 100½, A. W. Lemcke 102½, J. Jansen 103, J. C. Kruse 105½, Gus Hagenau 105½, H. C. Hainhorst 110, H. Rottger 111, D. Peper 117½, F. Lankenau 117, H. Haase 119½, H. Gobber 138.

### Zettler Rifle Club.

THE shooting conditions at the headquarters of the Zettler Rifle Club are more interesting on each weekly shooting day. On Feb. 9, the regular weekly shooting day, the most of the regulars engaged in the winter contest were present, as well as some visitors, who dropped in to see what was going on. Veteran M. Dorrlor, who up to the present time has not been engaged in the contest, was present. The club's joker, when he saw Dorrlor said: "Like the woodchuck, Michael has come out to look for his shadow." The members were all pleased to see him again and were only sorry that he was not in the race with them. But Dorrlor says he is out of it for the time being. W. A. Tewes was in good form, and in shooting his 100-shot score, he came very near to making a new record. As it was, he succeeded in tying the gallery record, 2,460, which is held by M. Dorrlor. Mr. Tewes was congratulated upon his good score, and commiserated for his inability to break the record.

Aug. Kronsberg was also in good form, and made a total of 2438. Chas. G. Zettler, Jr., was high for 50 shots.

Ten-shot scores, 25-ring target, distance 75ft., 100 shots: W. A. Tewes 2460, A. Kronsberg 2438, Geo. Schlicht 2405, Wm. A. Hicks 2396, Hy Fenwirth 2317, A. Rowland 2294.

Fifty shots: C. G. Zettler, Jr., 1213, R. Gute 1211, B. Zettler 1207, H. C. Zettler 1192, C. G. Zettler 1181, A. Moser 1205, Aug. Begerow 1171, Geo. H. Wiegman 1157, Geo. J. Bernius 1154.

### Lady Zettler Rifle Club.

At the monthly gallery shoot of the Lady Zettler Rifle Club, No. 159 West Twenty-third street, Feb. 13, a large group of the friends of the club were present. The ladies had sent out invitations to their friends to be present as guests. The ladies have a scheme to increase the club's funds through the sale of packages brought to the meeting by the members. Henry D. Muller, vice-president of the Zettler Club, was installed as auctioneer for the occasion.

He proved to be an expert salesman, and when the last package had been sold nearly all the gentlemen present were temporarily bankrupt. The net receipts from the sale and hat checks added \$43 to the club's treasury.

In the club shooting Misses Millie and Kate Zimmermann were first and second; Mrs. H. Fenwirth, the club's president, was third.

Ten-shot scores, 25-ring target, distance 75ft.: Miss M. Zimmermann 245, 247; Miss K. Zimmermann 241, 248; Miss A. Koch 241, 240; Mrs. H. Fenwirth 226, 245; Mrs. H. Scheu 233, 239; Miss F. Muller 240, 233; Mrs. W. H. Turbot 227, 240; Miss M. Laut 239, 231; Miss T. Eusner 234, 224; Mrs. J. Laut 229, 234; Mrs. Knaus 228, 228; Mrs. F. Watson 235, 217; Mrs. B. Zettler 202, 207.

### Cincinnati Rifle Association.

CINCINNATI, O., Feb. 14.—The following scores were made in regular competition by members of the Cincinnati Rifle Association, at Four-Mile House, Reading Road. Conditions, 200yds., off-hand, at the 25-ring target. Trounstine was champion for the day with the good score of 225; this score also raises his record 8 points. A tricky wind blew all day from 6 to 9 o'clock:

Trounstine	225	206	200	199	196
Hasenzahl	222	218	214	213	212
Payne	221	211	210	209	207
Gindele	221	216	205	203	...
Roberts	219	218	200	196	194
Hoffman	218	204	201	198	198
Nestler	216	214	213	203	203
Freitag	209	196	190	189	185
Bruns	204	203	202	199	199
A Lux	201	200	200	199	197
Hofer	199	197	187	186	177
*J Lux	225	206	204	203	198

\*Visitor.

### Miller Rifle and Pistol Club.

TWELVE members of the Miller club took part in the weekly shoot at the club's headquarters, 423 Washington street, Hoboken, Feb. 10. David Miller led the group for high score with 243.

Ten-shot scores, 25-ring target, distance 75ft.: D. Miller 243, C. Bischoff 242, D. Dingman 242, Owen Smith 240, F. Unbehauen 242, R. W. Evans 241, R. A. Goldthwaite 236, C. E. Doyle 232, A. Schwartz 227, L. Rodgers 214, C. Bayha 213, R. Strobel 208.

### Rifle Notes.

There is a club shoot in the Zettler gallery every night during this week. On Monday night the Plattdeutsch Corps; Tuesday night, the Zettler Club; on Wednesday night, the New York Central Corps; on Thursday night, the New York City Corps; on Friday night, the New York Independent Corps; on Saturday night, the Italian Shooting Society.

Next week, beginning with Monday, Feb. 22, is the Italian club; Tuesday, the Zettler club; Friday (Feb. 26), New York Corps; Saturday (Feb. 27), comes the opening of the annual gallery tournament and the champion 100-shot match.

The Shooting Times (London) in a recent issue, contained the following: "A novel competition has been arranged for the next meetings of the National Rifle Association at Bisley. The committee have decided to offer a prize of a hundred guineas for competition with automatic rifles suited for military purposes. Each rifle must be capable of being used either as an automatic or as a magazine rifle, and the change from one to the other must be simply and rapidly effected. It must also be a serviceable military weapon, and must fire only one shot at each pressure of the trigger."

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

# Schlitz

## A Doctor's Reasons

Patient: "Why do you say Schlitz beer? Isn't any other beer as good?"

Doctor: "Perhaps; but I don't know it. I do know that Schlitz beer is pure."

Patient: "What do you mean by pure?"

Doctor: "I mean free from germs. Impurity means bacilli; and in a saccharine product like beer bacilli multiply rapidly. I do not recommend a beer that may contain them."

Patient: "How do you know that Schlitz beer is pure?"

Doctor: "I have seen it brewed. Cleanliness is carried to extremes in that brewery. The beer is cooled in plate glass rooms, in filtered air. The beer is then

filtered. Yet, after all these precautions, every bottle is sterilized—by Pasteur's process—after it is sealed. I know that beer treated in that way is pure."

Patient: "And is pure beer good for me?"

Doctor: "It is good for anybody. The hops form a tonic; the barley a food. The trifle of alcohol is an aid to digestion. And the custom of drinking beer supplies the body with fluid to wash out the waste. People who don't drink beer seldom drink enough fluid of any kind. A great deal of ill-health is caused by the lack of it."

Patient: "But doesn't beer cause biliousness?"

Doctor: "Not Schlitz Beer. Biliousness is caused by 'green' beer—beer that is insufficiently aged. But Schlitz beer is always aged for months before it is marketed."

*Ask for the brewery bottling.*

## THE BEER THAT MADE MILWAUKEE FAMOUS

U.S. AMMUNITION

BEING RUSHED TO FRONT.

114-116 Market St., San Francisco.

### Cincinnati Gun Club.

TWENTY-SEVEN members gave the new series of cash prize shoots a good send-off on Feb. 13. The weather was cold and cloudy. Not much wind was blowing, but the targets were hard to see, and only two men broke over 40. Gambell was high with 44. Linn was second with 41, and Ahlers, Faran and Don Minto dropped in third place with 39 each.

Several members who were unable to be present on Feb. 6, shot their score in the Parker gun series during the week, and their scores follow:

Parker gun prize shoot, Feb. 6:									
Targets:	20	20	20	20	20	Broke.	Hdep.	Tot'l.	
Plunkett	11	10	11	13	10	55	40	95	
Muhleman	8	9	9	4	9	39	50	89	
Foucar	13	12	14	11	14	64	30	94	
Ward	12	15	15	17	13	72	40	100	
H. Sunderbruch	11	13	9	11	7	51	40	91	
Davies	15	17	17	15	18	82	23	100	

At a meeting of the executive committee, held last week, the conditions for the new cash prize series was changed as follows: The members were divided into three classes, A, B, and C; the money divided equally, \$80 for each class, with six prizes, \$20, \$17, \$15, \$12, \$9 and \$7. High guns. The first handicaps are as follows: Class A—Ahlers, 20yds.; Baker, 19; Don Minto, 18; Davies, 17; Faran, 17; Gambell, 20; Grau, 18; Medico, 19; Maynard, 18; H. Osterfeld, 17; Randall, 18; A. Sunderbruch, 19; See, 19; R. Trimble, 22; E. Trimble, 17; Williams, 17. Class B—Anderson, Butts, Burton, Boyd, Bullerdick, Bleh, Cook, Dick, Falk, Fredericks, Harig, Jay Bee, Jack, Kohler, Linn, Lindsley, Mills, McBreen, H. M. Norris, Nye, Geo. Osterfeld, Pohlar, Pfeiffer, Roll, Sampson, Wilhe, R. G. Ward, all at 17yds. Class C—Ackley, Boeh, Colonel, Foucar, Herman, Hoke, Hobart, Hoffman, Kramer, Krohn, Krehbiel, Muhleman, J. C. Norris, Neave, Plunkett, Roanoke, Sahngcn, H. Sunderbruch, Willie Green, all at 16yds.

Members handicapped themselves after the first shoot according to the score made.

The contests will be held every other week.

Supt. Gambell mentions a few things to remember in connection with these contests:

"Don't imagine you can't shoot. Come out and see.

"Don't think you will be in the way. It will be my business to see that you are comfortable.

"There will be twenty-seven contests. The more you take part in, the more scores you will have to select from.

"You must compete in fifteen shoots to qualify. You select your ten best scores from all you shoot."

First cash prize shoot, 50 targets:

Targets:	15	15	20	Targets:	15	15	20
Gambell, 16	12	15	17—44	Osterfeld, 17	9	12	14—35

BONASA.

### Ossining Gun Club.

OSSINING, N. Y., Feb. 13.—While the attendance was good at the Lincoln's Birthday shoot of the Ossining Gun Club, a balky trap spoiled what would otherwise have been a fine afternoon's shoot. The main event was to have been at 100 bluebirds, the last 25 of which were to decide a team match between Poughkeepsie and Ossining gun clubs. As the trap was throwing about one good bird in five, darkness called the event off after the third string of 25.

One of the stipulations governing the team race was that there must be no less than eight shooters on a team; as only six of the Poughkeepsie team put in an appearance, the results of their scores could only decide the ownership of the individual prizes, which were four silver candlesticks. The conditions governing these were: "The two high guns from each team in turn shoot off at 25 targets, the highest combined scores of each two winning the four candlesticks; they in turn shooting off for individual possession of all four of the prizes. Owing to darkness and a slight misunderstanding of the conditions, this event will be decided at a later date, when we expect to have another pleasant race with our brother shooters from up the river.

There were three trade representatives on hand: Sim Glover, Jack Fanning and Neaf Apgar. While Sim won the silver cup for high expert, they broke even in making friends for themselves and

the companies they represent. Mr. M. Herrington, of Shooting and Fishing, shot along. His presence at a shoot is thoroughly enjoyed, not alone because he has the knack of saying pleasant things in his paper, but on account of his genial personality.

First money was won by O. W. Von der Bosch, of Peekskill, with 67 out of 75. A. Traver, of Poughkeepsie, landed second, with 65. C. G. Blandford, of Ossining, captured third. A. L. Burns, Mamaroneek, fourth, and James Morrison, New York city, fifth.

Targets were thrown about 60yds.

The next trophy shoot of this club will be held on Feb. 20, when two cups will be contested for; also tie for telescope will be shot off by F. Brandreth and C. Blandford. Scores:

Events:	1	2	3	4	Events:	1	2	3	4
Targets:	15	25	25	25	Targets:	15	25	25	25

### Boston Gun Club.

BOSTON, Mass., Feb. 10.—The second weekly shoot of the Boston Gun Club was held at Wellington to-day. The zero weather prevented a large attendance, though to be sure, enthusiasm was not lacking by any means, and events passed off with the usual interest. To Griffiths and Ford the honors of the afternoon belong, both shooting a great gait for these grounds, and gave proof conclusive that the targets were breakable without resorting to hatchets and axes, as some shooters claim of the targets made at the present time. Ford ran 40 straight, 5 within the ground top score, and would have kept at it indefinitely but for a lack of regular loads, etc.

The team match proved of great interest, and as the number of points begins to enlarge, there will be lots of hustling on each aspirant's part to keep the ball rolling. At the present time the Frank and Bell syndicate have the lead, and from present indications intend to keep it, though there are as usual others, and funny things do happen with astonishing regularity. Scores as follows:

Events:	1	2	3	4	5	6	7	8	9	10
Targets:	10	10	5p	15	15	10	10	15	10	10
Climax, 21	7	9	3	6	9	8	14

### Class—Flanagan.

Lake Denmark, N. J.—A correspondent informs us that on Wednesday of last week a live-bird match took place between Mr. Frank Class and Hon. De Witt C. Flanagan. The conditions were 50 birds each, \$50 a side, loser to pay for birds. Each made remarkable kills, and received the applause of the spectators. Class shot in his old-time form. Flanagan had the harder birds, and several, though hard hit with both barrels, managed to struggle across the boundary. The scores:

Class	222222122222*1220220222121201222222*0222—44
Flanagan	12021221112120111*0*2120111022122*12121011*10222—39

In the near future, probably Washington's Birthday, two local shooters, Andrew K. Baker and Charles H. Munson, Jr., will shoot a match on the same grounds at 50 birds each.

### ON LONG ISLAND.

#### Brooklyn Gun Club.

Brooklyn, L. I., Feb. 12.—There was an active afternoon at the shoot of the Brooklyn Gun Club on Lincoln's Birthday. Eleven events were shot. The scores:

Events:	1	2	3	4	5	6	7	8	9	10	11
Targets:	10	10	15	15	10	15	10	15	10	10	10
H. Dreyer	5		9	7	3	11	3	8	6	6	8
H. Bergen	8	8	13	11	9	8	6	13			
G. Kelly	9	7	10	10	5					5	
F. Bergen	4		7	10	6	6	7	6			
J. S. Wright	8	7				6	3	7	7		
H. Newton			4	8	8						
Voorhes	7	5	12	9	5	7	4	9			

Nos. 10 and 11 were at 5 pairs.

J. S. WRIGHT, Mgr.

#### Oakland Golf Club.

Bayside, L. I., Feb. 12.—The main contest at the shoot of the Oakland Golf Club to-day was the J. M. High trophy event at 25 targets: Scores:

R. B. Lawrence, 5	1010110110000111111111100—21
R. B. Wigham, 5	111110110110100101111101—23
J. G. Frazer, 6	1110100110110101011111—23

C. Meyer, 6	000000101000110000110110—14

#### Crescent Athletic Club.

Bay Ridge, L. I., Feb. 13.—The competition was of a high order, many excellent scores being made. There was a stiff, frost-laden wind from the northwest, which numbed the fingers of the shooters materially.

A. G. Southworth and L. C. Hopkins respectively won two of the seven 15-target trophy matches; Dr. O'Brien won one prize. He and L. C. Hopkins were the high men in the shoot for the February cup, ten contestants. Each scored 25. A. G. Southworth was the winner of a miss-and-out. The scores:

February cup, 25 targets, handicap: F. T. Bedford (2) 21, J. J. Keyes (2) 22, A. G. Southworth (3) 24, W. W. Marshall (5) 22, F. B. Stephenson (1) 20, E. H. Lott (1) 22, H. B. Vanderveer (3) 20, Capt. Money (3) 24, L. C. Hopkins (4) 25, H. L. O'Brien (4) 25.

Sykes cup, team shoot: F. T. Bedford (2) 24, J. J. Keyes (2) 18; total 42. A. G. Southworth (3) 23, W. W. Marshall (5) 19; total 42. E. H. Lott (1) 21, H. B. Vanderveer (3) 22; total 43. Capt. Money (2) 22, L. C. Hopkins (4) 22; total 44.

Palmer trophy, 25 targets: Capt. Money (2) 25, F. B. Stephenson (1) 23, J. J. Keyes (2) 20, W. W. Marshall (5) 18, E. H. Lott (1) 23, F. T. Bedford (2) 23.

Trophy match, 15 targets: F. B. Stephenson (0) 12, E. H. Lott (0) 12, H. L. O'Brien (2) 12, Capt. Money (1) 12, H. B. Vanderveer (1) 12, A. G. Southworth (1) 12, L. C. Hopkins (2) 10.

Shoot-off: Capt. Money 15, Stephenson 14, O'Brien 14, Southworth 14.

Trophy match, 15 targets: F. B. Stephenson (0) 14, E. H. Lott (0) 13, H. L. O'Brien (2) 14, Capt. Money (1) 15, H. B. Vanderveer (1) 12, A. G. Southworth (1) 14, L. C. Hopkins (2) 12.

Won by Capt. Money.

Trophy match, 15 targets: H. L. O'Brien (2) 11, A. G. Southworth (1) 14, Capt. Money (1) 12, W. W. Marshall (3) 12, F. B. Stephenson (0) 12, E. H. Lott (0) 12, H. B. Vanderveer (1) 14, L. C. Hopkins (2) 15.

Won by L. C. Hopkins.

Trophy match, 15 targets: H. L. O'Brien (2) 12, L. C. Hopkins (2) 15, A. G. Southworth (1) 13, Capt. Money (1) 13, F. B. Stephenson (0) 12, W. W. Marshall (3) 12, E. H. Lott (0) w., H. B. Vanderveer (1) 10, J. J. Keyes (1) 12.

Won by L. C. Hopkins.

#### Shrewsbury Gun Club.

SHREWSBURY, Pa., Feb. 12.—Fourteen shooters participated in the tournament of the Shrewsbury Gun Club to-day. Hawkins was first with 138 out of a total of 145. Coe was second with 122. The scores:

Events:	1	2	3	4	5	6	7	8	9	10	
Targets:	10	15	15	15	15	15	15	15	15	15	Broke.

### TRAILS OF THE PATHFINDERS.

To us in America the day of adventure in wild lands seems past and gone—yet not so long past but that there are men alive who can remember it—and surely there never took place wilder scenes of adventure than were constantly occurring in the West in these early days.

This year there is to be celebrated at St. Louis the centenary of the Louisiana Purchase by which a vast territory was added to what belonged to the then newly born United States. The story of exploration and discovery in that new territory, and in the Western country at large, is full of excitement and romance, and we begin this week to publish a series of articles under the above title which tell something of what was done and seen and felt by the heroes of an earlier day who left behind them written records of their achievements.

The first explorers of the West were missionaries, led thither by the hope of saving the souls of the natives, but hard on the heels of the missionaries followed trapper and trader, whose example was so widely different from the precept of the black-robed fathers that the missionaries strove to have voyageurs and traders alike kept out of the country, on the ground that they corrupted the natives and brought disgrace on the Christian religion.

The articles to be published will deal with the most important and best known of the explorers of those early days. They will tell of Alexander Henry, the elder, who in 1761 pushed boldly off from Lachine on his westward journey, and for sixteen years suffered every danger and every hardship; of Jonathan Carver, and Pike and Long and Gregg and Kendall and Ruxton and Garrard and Townsend, the naturalist, and many another who beat out unknown trails and trafficked and fought with the Indian and slew the grizzly bear.

There is no one of these men but led a heroic life and associated with heroes like himself, whose exploits he relates—all unconscious of their heroism. We who to-day are living our commonplace business or professional lives may look with wonder upon this race which has wholly passed away.

### NEW YORK SPRING SHOOTING.

An Assembly bill, No. 292, to amend the game laws of New York State, proposes to change the close of the open season for ducks from January 1 to April 1. This bill passed the Lower House February 10, and now goes to the Senate.

The opponents of the bill requested Mr. Reeve, chairman of the Assembly Fish and Game Committee, to permit them to appear before the committee in opposition to the bill, but their request was denied, the statement being made that a hearing had already been held. Immediately after that the bill passed the Assembly, and is now before the Senate.

This bill was introduced by Mr. Hubb, representing the Long Island duck shooters, who from the beginning have been opposed to the abolition of spring shooting. They are determined that, if possible, they will continue to destroy the birds in spring, whether sentiment of the State or that of the whole country is opposed to spring shooting.

The new law cutting off in New York the shooting in the spring of ducks, geese, and swan, has had no opportunity to be tried, for this is its first season. Moreover, the law has not been well observed on Long Island, as is shown by the frequent complaints made in these columns and elsewhere.

Within a short time all of Canada, and several of the New England States, have put an end to the shooting of birds in spring, and the same action has been taken by a number of States further to the westward, and this action has been followed by a very considerable increase in the number of our wildfowl.

Whether this increase has been brought about by the abolition of spring shooting, by which the birds remain unmolested both on their way to their breeding ground and while they are nesting, cannot yet be told. The laws have not been working long enough for us to be certain on this point. What is certain, however, is that for the

last year or two wildfowl in many localities have shown a distinct increase, and no cause is known which will account for this increase, except the fact that the birds have been protected in many localities where they were formerly shot at the breeding season.

It will be a shameful thing if the State of New York, having once had the wisdom to shorten the open season for wildfowl, should now, at the behest of a small section of the State, reverse such action and again countenance the destruction of birds breeding or about to breed. And it seems also a shameful thing for this great State to take advantage of the protective measures adopted by its neighbors to the north and to continue selfishly to destroy the birds which those neighbors are striving to protect, in order that they may increase for the benefit of all the sportsmen of America.

Slight as is the interest taken in game protection by many of our legislators, New Yorkers have at least the satisfaction of knowing that there are some men at Albany who are devoted to its principles. In Senator E. R. Brown, of Jefferson county, the friends of game protection have a tower of strength. His zeal in well doing is untiring, and his acquaintance with game conditions in this State qualifies him to speak with high authority on all subjects which come before his committee. It is upon Senator Brown that the friends of game protection must rely for the continuance in operation of the bill abolishing spring shooting of fowl which he passed last year.

### HUNTERS' LUCK AND PLACE-NAMES.

CHANCE has played a large part in geographical nomenclature; and more than one trivial incident of hunters' luck has been commemorated in some familiar place-name. Bear, Buffalo, Elk and Deer in various combinations dot the map, and indicate that in some now remote period the places bearing them were the haunts of these animals. There are more than sixty Elk or Elk-something-or-other places in the United States named for the old-time stamping grounds of the game. In two instances the name has special significance. Elkton in Michigan was so called by Martin Baker, an early settler, who saw two large elk there, when the first building was being put up. Elkhorn in Wisconsin took its name from the Elkhorn prairie, which was so called in the year 1830 from the finding of an elk horn in a tree.

There are many Deerfields; but the one in New Hampshire was named by hunter's luck. When the petition for a town was pending, one of the settlers, a Mr. Batchelder, killed a deer, which he presented to Governor Wentworth, and in return for it obtained the act setting apart the town and the name. Antelope county in Nebraska received its name from the killing and eating of an antelope by a party of settlers in pursuit of some Indians. The village of Buck-Creek, in Indiana, was so named because for several seasons a certain buck was seen in the vicinity of a creek near by. Bear Creek, in the Yellowstone Park, was given its name by a party of explorers who found a hairless cub on its banks; while a mountain peak in Colorado took its name Grizzly from an adventure which another company of explorers had with a full grown bear. Once upon a time a German hunter got lost in Pennsylvania in a locality which he described as a "hosensack," a German word meaning a "breeches pocket." The name stuck, and afterwards when a town was established there it was called, and is called to this day, Hosensack.

### DISCUSSION.

IN the practical affairs of life, whether of sport or business, intelligent discussion of their details adds inestimably to the sum total of human knowledge. No one possess all the knowledge on any given subject.

It is true that in many of the mechanical arts there is a general acceptance of what constitutes their true theory and practice; but even they have many speculative features and are constantly undergoing the changes which are inseparable from true progress. But when it is considered that artisans work in groups and that therefore their scientific and empirical knowledge is acquired under like conditions in the main, it is apparent that there is no obstacle to their common acceptance and agreement concerning their common theme. It is principally a matter involving cause and effect as they relate to material things. It is quite different from matters of fancy.

In the realm of sports, particularly those of the dog and gun, rod and reel, boating and camping, etc., the personal equation is conspicuously dominant. The angler or hunter, to attain even a reasonable degree of success, must seek his sport alone, or with a minimum of company. The more members in a party whose purpose is to seek duck or deer, or to cast fly or frog, the less are its chances then of material success.

From long usage and more or less success from solitary effort the average sportsman becomes habituated to his own personal methods, and when the best methods of his sport come into question, he maintains his own opinions and methods sturdily against all opponents. This is an admirable trait of sportsmen, this generously frank characteristic to divulge freely the best information they have, and fearlessly to defend what they believe to be true.

What knowledge pertaining to his craft the artisan acquires in groups from common observation, the sportsman acquires by individual experience as it pertains to his sport, and by discussion of it with his fellows.

Thus, while no one individual possesses all knowledge, a great many individual sportsmen may individually possess bits of valuable knowledge which, when divulged, inures to the general benefit and progress of the guild. The profitable discussions in FOREST AND STREAM and other journals through the weeks and years on all the innumerable phases of natural history, shooting, fishing, yachting, travel, camping, etc., illustrate the matter under consideration.

SENATOR PROCTOR has introduced for Senator Dillingham a bill to repeal the present game law of Alaska and to substitute for it a law which shall provide for nothing more than to prohibit the export of the heads, hides, or carcasses of deer, moose, or caribou, except that a resident, upon payment of a \$25 license fee, or a non-resident, upon payment of a fee of \$250, may export the heads, hides, and meat of two deer, moose, and caribou, and no more. The proposed repeal of the existing law has grown out of the complaints of deprivation laid before the Senate committee of investigation in Alaska last summer. Whatever may have been the merits of the case, with respect to the natives, the remedy for any existing evils surely may be found in some expedient less radical than the repeal of the law. This proposed substitute makes no note of the wild sheep which should have protection; nor does it make any note of the local marketing of game, which surely should be regulated.

THE Washington Centennial Guard celebrated Washington's Birthday with a banquet in the Long Room of Frances' Tavern, in this city, the room in which Washington took leave of his officers. In such a place, hallowed by association with the man who would not tell a lie, the spirit of truth holds sway, and the speakers last Monday confined themselves to the strictest verities. Among the important historical facts recalled by Mr. Louis F. Cornish, secretary of the Sons of the American Revolution, was this, that in 1740 lobsters ranged six feet long in New York Bay, and were of that size until all the big ones were scared away from these waters by the commotion of the British fleet; and oysters in those days he said, were fourteen inches long. Truly we live in degenerate days; but it is a world of compensation; lobsters have decreased in size most deplorably, but when it comes to long bows the Sons are a hundred years in advance of their Revolutionary sires.

THE official reports tell us that for long continued severity the winter of 1903-4 surpasses any since the Weather Bureau was established. It has been a time of stress for the wood inhabitants, and disaster has overwhelmed the game supply throughout wide areas. The attention of individuals and associations concerned may now profitably be directed to restocking the covers which have been depleted. The Massachusetts Association is raising funds for the purpose of procuring live quail to put out this spring. The enterprise of restocking has been made extremely difficult of recent years by the arbitrary intervention of the Department of Agriculture to prevent the transportation of live birds from the Indian Territory, and the Massachusetts people will probably find it simpler to raise funds than to discover a source of supply from which to draw their birds.

# THE SPORTSMAN TOURIST

## Trails of the Pathfinders.

### I.—Introduction.

LESS than three hundred years ago a half dozen tiny settlements, peopled by white men, dotted the western shores of the North Atlantic Ocean. The several villages owed allegiance to nearly as many nations of Europe, each of which had thrust out a hand to grasp, and if possible to hold, a share of the wealth which might lie in the untrodden wilderness that stretched away from the sea shore to the unknown beyond. Even at that early day, travelers, chiefly missionaries, had penetrated the interior, but however far they journeyed had found lands occupied only by wild beasts of the forest or the prairie, and by the wild men who preyed upon them. To the south, it was known that beyond this continent lay another ocean, but what this ocean was, what its extent, and what its limits, were still secrets.

St. Augustine had been founded in 1565; and forty years later the French made their first settlement at Port Royal, in what is now Nova Scotia. In 1607 Jamestown was founded; and only a year later the French established Quebec. The Pilgrims landed in Massachusetts in 1620; and the first permanent settlement of the Dutch on the Island of Manhattan was in 1623. But for many years after these dates the struggling colonists had enough to do to keep body and soul together without attempting to discover what was beyond them—beyond the sound of the salt waves which beat upon the coast. Not until much later was any effort made to discover what lay in the vast interior.

Time went on. The settlements increased. Men pushed further and further inland. There were wars; and one nation after another was crowded from its possessions, until, at length, the British owned all the settlements in eastern temperate America. The white men still clung chiefly to the sea coast, and it was in western Pennsylvania that the French and Indians defeated Braddock in 1755, George Washington being an officer under his command.

A little later came the war of the Revolution, and a new people sprang into being in a land a little more than two hundred and fifty years known. This people, teeming with energy, kept reaching out in all directions for new things. As they increased in numbers they spread chiefly in the direction of least resistance. The native tribes were easier to displace than the French, who held forts to the north, and the Spanish, who possessed territory to the south; and the temperate climate toward the west attracted them more than the cold of the north or the heat of the south. So the Americans pushed on always to the setting sun, and their early movements gave truth to Bishop Berkeley's line, written long before and in an altogether different connection, "Westward the course of Empire takes its way." The Mississippi was reached, and little villages, occupied by Frenchmen and their halfbreed children, began to change, to be transformed into American towns. Yet in 1790, 95 per cent. of the population of the United States was on the Atlantic seaboard.

Now came the Louisiana Purchase, and immediately after that the expedition across the continent by Meriwether Lewis and William Clark. The trip took two years' time, and the reports brought back by the intrepid explorers, telling the wonderful story of what lay in the unknown beyond, greatly stimulated the imagination of the western people. Long before this it had become known that the western ocean—the South Sea of an earlier day—extended north along the continent, and that there was no connection here with India. It was known, too, that the Spaniards occupied the west coast. In 1790, Umfreville said: "That there are European traders settled among the Indians from the other side of the continent is without doubt. I, myself, have seen horses with Roman capitals burnt in their flanks with a hot iron. I likewise once saw a hanger with Spanish words engraved on the blade. Many other proofs have been obtained to convince us that the Spaniards on the opposite side of the continent make their inland peregrinations as well as ourselves."

Western travel and exploration, within the United States, began soon after the return of Lewis and Clark. The trapper, seeking for peltry—the rich furs so much in demand in Europe—was the first to penetrate the unknown wilds; but close upon his heels followed the Indian trader, who used trapper and Indian alike to fill his purse. With the trapper and the trader, naturalists began to push out into the west, studying the fauna and flora of the new lands. About the same time the possibilities of trade with the Mexicans induced the beginning of the Santa Fe trade, that "Commerce of the Prairies" which has been so fully written of by the intrepid spirits who took part in it. Meantime the Government continued to send out expeditions, poorly provided in many ways, scarcely armed, barely furnished with provisions, without means of making their way through the unknown and dangerous regions to which they were sent, but led by heroes.

For forty years this work of investigation went on;

for forty years there took place a peopling of the new West by men who were in very deed the bravest and most adventurous of our brave and hardy border population. They scattered over the plains and through the mountains; they trapped the beaver and fought the Indian, and guided the explorers; and took to themselves wives from among their very enemies, and raised up broods of hardy offspring, some of whom we may yet meet as we journey through the cattle and the farming country which used to be the far West.

If ever any set of men played their part in subduing the wilderness, and in plowing the ground to receive its seed of settlement, and to rear the crop of civilization which is now being harvested, these men did that work, and did it well. It is inconceivable that they should have had the foresight to know what they were doing; to imagine what it was to be that should come after them. They did not think of that. Like the bold, brave, hardy men of all times, and of all countries, they did the work that lay before them, bravely, faithfully, and well, without any special thought of the distant future; surely without any regrets for the past. As the years rolled by, sickness, battle, the wild animal, starvation, murder, death in some form, whether sudden or lingering, struck them down singly or by scores; and that a man had been "rubbed out," was cause for a sigh of regret or a word of sorrow from his companions, who forthwith saddled up and started on some journey of peril, where their fate might be what his had been.

At the end of forty years the first series of these exploratory journeys came to an end. Gold was discovered in California. The Mexican War took place. This was not unexpected, for in the Southwest, about the Pueblos of Taos and Santa Fé, skirmishings and quarrels between the Spanish-Indian inhabitants, and the rough mountaineers and teamsters from the States had already given warning of a conflict soon to come.

Now, well-traveled wagon roads crossed the continent, and a stream of westward immigration that seemed to have no end. Before long there came Indian wars. The immigrants imposed upon the savages, ill-treated their wives, and were truculent and overbearing to their men. Indians stole from the immigrants, and drove off their horses. Then began a season of conflict, which by one tribe and another, yet with many intermissions, lasted almost down to our own day. For the most part, these Indian wars are well within the memory of living men. They have been told of by those who saw them and were a part of them.

Of the travelers who marched westward over the arid plains, during the period which intervened between the return of Lewis and Clark and the establishment of the old California trail, and of the earlier northmen, who trafficked for the beaver in Canada, a few left records of their journeys; and of these records, many are most interesting reading, for they are simple, faithful narratives of the every-day life of travelers through unknown regions. To Americans they are of especial interest, for they tell of a time when one-half of the continent which now teems with population had no inhabitants. The acres which now contribute freely of food that subsists the world; the mountains which now echo to the rattle of machinery, and the shot of the blast which lays bare millions of precious metal; the waters which are churned by the propeller blades, transporting all the varied products of the land to their markets; the forests, which, alas! in too many sections, no longer rustle to the breeze, but have been swept away to make room for farms and town sites—all these were then undisturbed and natural, as they had been for a thousand years. Of the travelers who passed over the vast stretches of prairie or mountain, or woodland, many saw the possibilities of this vast land, and prophesied as to what might be wrought here, when, in the dim and distant future, which none could yet foresee, settlements should have pushed out from the east and occupied the land. Yet, up to within a very few years, no one, perhaps, conceived of that land's possibilities.

It seems fitting in this year when the celebration of the one hundredth anniversary of the acquisition of the Louisiana Purchase is being held, that we should take a glance backward to something more than a century ago, and should review, even though very briefly, some of the work that was done by the pioneer travelers in the West. Nor does there seem a more effective or more just way to do this than to let some of these travelers tell the story of their journeyings very much in their own way.

The books that were written concerning this new land are mostly long out of print, and difficult of access; yet each one of them is well worth perusal. Of the authors from whom we shall quote, some bear names still familiar, even though their works have been lost sight of. Some of them made discoveries of great interest in one branch or other of science. At a later day some attained fame. Parkman's first essay in literature was his story of "The California and Oregon Trail," a fitting introduction to the many fascinating volumes that he contributed later to the early history of America; while in Washington Irving, one of the

greatest of America's historians and essayists, was found a narrator who should first tell connectedly of the fur trade of the Northwest, and the adventures of Bonneville.

Not only are many of the books of that day out of print and hard to obtain, but some of them have been forgotten by all except the student whose interest in the early West is sufficient to induce him to consult the bibliophiles who know these volumes. Their names are found now and then in the footnotes of some history, but except for this they are forgotten—as much unknown as if they had never been written. "Astoria," the "Tour of the Prairies," and the "Adventures of Bonneville," remain classics, to be sure, and Parkman's first volume has not been lost sight of. Yet Caron and Henry, of the north, Gregg and Kendall, who pictured the early trade between St. Louis and the Spanish settlements, with Ruxton and Garrard, and Farnham, and Townshend, and Parker, and many others who, as traders, tourists, naturalists and explorers, traversed these unknown wilds in the early days, and who left vivid records of the conditions which then prevailed, have almost wholly passed from the memory of the general public.

Beside the books that were published in those times, there were written also accounts, usually in the form of diaries, or of notes kept from day to day of the happenings in the life of this or that individual, which are full of interest, because they give us pictures of one phase and another of the early travel, or hunting adventures, or trading with the Indians. Such private and personal accounts, never for the public eye, are today of extreme interest; and it is fortunate that an American student, the late Dr. Elliott Coues, has given us matchless volumes which tell the stories of some of these diarists. Dr. Coues' editions of Lewis and Clark, Pike and Long, and his publication of the diary of Jacob Fowler, of Alexander Henry, the younger, and of Charles Larpenteur, are contributions to our history of the winning of the greater West, whose value is only now beginning to be appreciated. It is gratifying to see that a younger man has arisen who is likely to follow in the footsteps of the illustrious predecessors, to take up the work which Dr. Coues laid down; and we hope that Capt. Hiram Chittenden will find time and inclination to carry forward, through many years, his studies of the old-time West.

The articles which are to follow contain much of history which is old, but which, to the average American, will prove absolutely new. Fond of reading though a man may be, he finds it impossible nowadays to keep up with the flood of literature that pours from the presses, and he has little time to devote either to hunting up these old books or to reading them after they have been unearthed. One may imagine himself very much interested in the old West, familiar with its history and devoted to its study, but it is not until he has gone through volume after volume of this ancient literature that he realizes how greatly his knowledge lacks precision, and how much he still has to learn concerning that country whose centenary is now about to be celebrated.

The work that the early travelers did, and the books they published, showed to the public of their day the conditions which existed in the West, caused its settlement, and led to the slow discovery of its mineral treasures, and the slower appreciation of its possibilities to the farmer and stock-raiser. Each of these volumes had its readers, and of the readers of each we may be sure that some, or many, attracted by the graphic descriptions of the new land, determined that they, too, would push out into it; they, too, would share in the wealth which it spread out with lavish hand.

It is all so long ago that we who are busy with a thousand modern interests, care little about who contributed to the greatness of the country which we inhabit, and the prosperity which we enjoy. But there was a day, which men alive may still remember, a day of strong men, of brave women, hardy pioneers, and true hearts, who ventured forth into the wilderness, braving many dangers that were real, and many more that were imaginary, yet to them seemed very real, occupied the land, broke up the virgin soil, and peopled a wilderness.

How can the men and women of this generation—dwellers in cities, or in peaceful villages, or on smiling farms—realize what those pioneers did—how they lived? He must have possessed stern determination and firm courage; who, to better the condition of those dearest to him, risk their comfort—their very lives—on the hazard of a settlement in the unknown wilderness. The woman who accompanied this man bore an equal part in the struggle, with devoted helpfulness, encouraging him in his strife with nature, or cheering him in defeat. It the school of self-reliance and hardihood in which their children were reared gave them little of the love of books, it built strong character and made them worthy successors of courageous parents. We may not comprehend how long and fierce was the struggle with the elements, with the bristling forest, with the unbroken soil; how hard and wearing

the annoyance of wild beasts, the anxiety as to climate, the fear of the prowling savage. Yet the work was done, and to-day, from the Alleghenies to the Pacific, we behold its results.

Through hard experience these pioneers had come to understand life. They possessed a due sense of proportion. They saw the things which were essential; they scorned those which were trivial. If, judged by certain standards, they were rough and uncouth, if they spoke a strange tongue, wore odd apparel, and lived narrow lives, they were yet practicing—albeit unconsciously—the virtues—unflinching courage, sturdy independence and helpfulness to their neighbors—which made America what it is.

In the work of travel and exploration in that far West of which we used to read, the figure which stands out boldest and most heroic of all is unnamed. Bearded, buckskin-clad, with rough fur cap, or kerchief tied about his head, wearing powder horn and ball pouch, and scalping knife, and carrying his trusty Hawkins rifle, the trapper—the *coureur des bois*—was the man who did the first work in subduing the wild West, the man who laid the foundations on which its present civilization is built.

All honor to this nameless hero. We shall meet him often as we follow the westward trail.

GEO. BIRD GRINNELL.

## Floating Down the Mississippi.

### VI.—Some People of the River—II.

In the neighborhood of Cape Girardeau one notices the first reaches of the great swamp region of the Mississippi Basin. Heretofore there have been occasional trees on which ivy and grape vines grow, but now there is, on the west bank, a considerable stretch of swampy thicket, the leaves of which hang on limp stems and the scattered trees are embraced by deadly parasites which inevitably give an appearance of sadness to the landscape—at least so to my eyes, for of all horrible things, a parasite is the worst, even though it be fruitful and flower bearing. The grace is never so luxuriant as when twining over a frame harmlessly, and the loveliest creepers do not spend their lives combating with a victim in their coils. It seems to me that the feeling of melancholy which is in the southern climate comes of this feature in nature more than from anything else.

Doubtless there are signs of the South far north of the Cape, for Missouri with its lowlands and its mountains contains much that is from the South, and much that is from the North as well—an ideal State for those who would have two climates in one, but, forewarned by the alluvial maps, one looks more keenly about himself as he nears the locality at which the geographical change takes place. One would know without a map, after a time, that he had passed from between the bluffs of the upper Mississippi, for he would miss the beautiful—wonderfully beautiful—effects given by bare stone of rocky cliffs in the distance to the east as seen between the branches of waving willows at intervals—a circumstance the cartographers as early as 1713 did not fail to note, but for which modern commercial map makers have no eye.

Thousands of maps showing the Mississippi have been made. Those by the Mississippi River Commission are gratifyingly accurate, and exceeding useful to the skiff traveler, even if the channel has shifted through some of the towns along the route, and gone to the far side of the islands since they were drawn, but they show the lines of the bluffs, where the willows and swamps are, and name the sloughs and landings. The first explorers had none of these, of course, and if any directions at all, it was a name and a few lines done on a piece of bark, with moons and suns to indicate the time it would take to go from one rude landmark to another. Later, the frontiersman, if he carried anything besides a compass to show the way, had rude wood engravings on which the picture of a house indicated a town, a picture of buffaloes, the prairie, and perhaps a tomahawk to show where to keep unusually keen lookout. It may be said that the modern fashion of locating scenes by money-order post-offices and railroad lines is best; perhaps so, but one, at least, did not enter the lower valley without a tinge of regret that so much of the old had been buried in the shifting sandbars. In a hundred years someone else will come down this stream, and seeing wide cultivated fields where the maps of 1900 show "lands liable to be flooded" to have been, will offer similar regrets as to the things that are before my eyes. What wonderful days will those of the nineteenth century be a thousand years hence!

On October 14 Jack and I reached the outlet of Big Lake, at the Mississippi Cairo ferry landing. Had we known, we could have saved miles by that slough from Buffalo Island. The City of McGregor was going over in a few minutes, so I crossed on her, and went into Cairo with its "Egypt Electric Railway Company" and other things eastern. Cairo is a water-level town, protected by a levee, at which, during high waters, there is always an anxious watch kept lest a crevasse occur, and the place and the houses be floated around among themselves. Naturally in a town built on silt, at the junction of two such streams as the Mississippi and Ohio, one does not expect to see buildings of magnificent appearance—and he does not. The residents nod to the stranger and say "howdy," and the stores sell anything from groceries to drygoods in the country district fashion. At one butcher shop I was told a tough piece of meat "was the finest clover-fed beef I ever put in my mouth, and such a kind as the blink-blank chap down the street never thought of keeping." Three men scurried round to cut a thirty-five cent chunk off, and a silver dollar like to have stumped the change man.

We camped at the mouth of Big Lake slough for the night, and welcomed its unstained waters after the steady diet of Mississippi mud.

In the morning, when we had passed the mouth of the Ohio, there was a decided change in the appearance of the river. The increased depth was probably the cause of this, but it may have been the strong wind that sent us scurrying to a sandbank to look around for a place to

wait. Not finding any, we crept along close to the land, and far behind saw a certain D liner skiff, with a canvas "hog pen" over the stern. There were two men in it, and it was evident that they were coming in our trail, for the one at the oars rowed rapidly, pushing instead of pulling, and so having an easy view ahead. Not finding a place to our satisfaction, Jack and I managed to keep inshore and get on some miles, and toward night reached Putney Bend, ten miles from Cairo, where we found S. M. Sugg and James N. Poole selling medicine from a cabinboat. Sugg is an ex-Rough Rider of Roosevelt's Volunteers, and Poole a remarkable river man, wearing a white collar. When asked what he was doing, he answered that he was doing everybody he could—probably a not inaccurate description of himself. He had "worked most of the smaller river towns" for years, and both men were cheerful over the prospect before them on the river, for their medicines were going rapidly in exchange for everything from flour to young turkeys and cash. One trading on the river must be prepared to accept anything in payment for his goods. Cash is not always to be had at the plantation landings, where the cabinboats do most of their business.

We were just nicely acquainted with the medicine men when along came a light blue-eyed man, with a coat on his arm and a little yellow dog—the whole outfit an example of "protective coloring" for the river bank. He went to the houseboat and wanted to join them—"would work his way." Refused, he asked me if I didn't want someone to pull my boat for me, and my pardner gave him no opportunity by saying there was no opening in his boat.

The cabinboat gave him something to eat, and he ate so hungrily that it was plain his fare had been hard lately. Late in the "evening" Jack and I made up a lunch for him and gave him a quarter, for if he really was in straits it was a hard place to be so.

Jack meantime had taken out his rifle and carried it on his shoulder up and down as he did camp work, finally putting up a stick and taking lengthy aim punched a charcoal spot. "Well, he can shoot, if he does wear glasses!" our visitor said.

The D liner (an Illinois river type of craft) came down at this time, and, as Sugg said, the man "was belly-aching about the wind." He claimed to be a fisherman, and refused to take the man with the dog on board. The dog, by the way, "belonged to my daughter, who was twelve years old when she died, and she raised it herself on a bottle, so you won't blame me for taking care of it." He disappeared and then the "fisherman" in the D liner said he wouldn't camp on shore or the mainland, but only on islands. Jack, with his all in the Jo-boat, was for starting right on, but I refused, and at dusk we saw the D liner come ashore just around the bend below us in response to a hail from our man with the dog. It was plain that the men were pardners.

We went up to the cabinboat, and with our duffle on board her, and the boats locked, slept securely enough. But it was not pleasant to know that these two genuine river rats were in the vicinity.

On the following morning we ran out to a passing houseboat, learned that it was a fisherman outfit on the way down to the Obion, some miles below Carruthersville, where Jack was going, so we kept in sight of them for the next few days, sometimes ahead, sometimes behind, passing the time of day once in a while, and learning that the D liner had come out of the Ohio just ahead of them. For five days the skiff was either just before or just behind us, running into sloughs if we stopped, and waiting for us to pass, and then dropping into our wake. It went into a rag-boat outfit off Point Pleasant on the 21st, stayed there an hour, and then stopped in a slough just above Tiptonville until Jack and I passed by, and moving out to the mouth of the slough where our course could be watched, if that is what was wanted.

To be dogged by river rats nearly a hundred miles is not a pleasant experience, nor one conducive to good temper, especially when one has a note-book full of the desperate crimes committed along the river. As for instance:

A few years ago a storeboat owned by one Summers was expected to arrive at Reel Foot, a sister of the storekeeper's wife having received a letter that it was coming, and would be in about a certain date. The date came and went by, and no news was heard of them, and then one day a boat came down to the landing, and the man aboard asked some of the men ashore if they didn't want to buy some potatoes, of which he had a number of bags full. The men went aboard, found the potatoes to their liking, and some bags were purchased. One of the buyers was the brother-in-law of the storekeeper, and gazing around him, remarked:

"Why, this looks like Summer's boat?"

"I bought it of a man named Summers," was the boatman's reply.

"There's his toolchest, too—buy that?" another man asked, and then, suspicion being aroused, more questions were asked, terminated abruptly by the storeman grabbing a gun behind the counter and ordering them off. "Of course they went, not being armed or nothing." Then the boat turned loose and dropped down the river. It was not out of sight before word came that Summers had been found murdered in the river; whereupon a lot of men with guns ran down the river bank and caught up with the boat as it landed just above Carruthersville. The man within was captured, and when the sacking on the floor was moved, the stains of the crime were found. Both victims had been cut to death with an ax—a favorite river weapon. The man was sentenced to a considerable term in the penitentiary, but escaped. He had come to the houseboat "to work his passage." The murder was done in the bloody miles below Cairo.

Storeboats are favorite game with the river outlaws, and the storeboatmen tell fearful stories of the experiences of their kind.

Just above New Madrid Jack and I stopped at Bessie Landing, and Robison, a storeboat man, entertained us with some choice selections of river life, beginning right at that landing.

"See those niggers!" he said, just at dusk, "they go way out around thataway because of that man getting killed up there on those bank steps last spring."

"How's that?" I asked.

"Well, you see, there was some brothers been to a whiskey boat, I expect, and borrowed a board off the old man Redmond—he fished for a living—who had his camp there, to shoot crabs on. It got dark and they asked for the lamp of the old man's boy, who was getting supper, and the boy wouldn't, so they up and shot the chimney off and tried to get the dog. The old man, down after a pail of water here, heard the boy yell, grabbed a corn knife that long" [about two feet] "and like to have killed one of the boys, till the other shot him, and then they put ten or twelve bullets into him. They're out on bail now, I expect. And say, there's that case of What's-his-name now—I'll ask my wife. Myra, what's the name of that man the niggers killed down to Bluejay Landing—why, yes, you do—that Cincinnati storeboat man—oh, yes, Don Bartlett, they got him last April—"

"My goodness!" said Jack, rising from behind the storeboat stove, and going for our skiffs on the trot. He got my revolver, and sat the rest of the evening with it in his hands, saying, "By gracious, I want something to protect myself with!"

It made the old man nervous, and me, too, to listen to such stories at a landing where the negroes go way out around in order to avoid stepping on the sands that had been stained with blood. It gives a sense of realism to such stories not found elsewhere, and makes the river a very lonely place to the fearful ones. But one takes comfort in the fact that if a man shoots a marauder he is not likely to be punished for it, even if murder. But he must be careful, else he is likely to be fined for carrying a revolver. The second mate of the steamer Stacker Lee killed a roustabout at Tiptonville last spring, and he's been under bonds ever since to answer the charge of carrying a revolver contrary to law.

The Obion River houseboat passed Bessie just before dark, and on the following morning the wind drove her ashore for shelter, opposite New Madrid, and we followed, overtaking her, because Jack wanted company to Carruthersville, as I was to leave him at Tiptonville, in order to take a look at Reel Foot Lake and the Sunk Lands. The wind increased after we put out on the following morning, but Jack and I refused to remain behind the sandbar just below the dull, but historically interesting, New Madrid, having stopped behind the one at Hickman, and breathed sand for hours because of the wind, so we crossed to the caving banks on the west side, and followed them to what seemed a fine chance for a cut-off of miles. Water was just pouring through a chute.

Just the day before we had run Winchester Chute, coming out where Island No. 10 used to be, scraping our keels on its historic sands, but this seemed so much better than that narrow and shallow place that it seemed worth risking; so in we went, Jack in the lead.

When Jack began to use a pole and push and grunt and swear, I tied up, and after a while waded in to help tow through the quicksand. A long hour we passed there, but I happened to find a channel and only scraped the bottom once with my boat. The old keelboatman said, "Never take a chute on a falling river." It's good advice for modern skiffmen as well on the mighty river—unless he's anxious to know quicksand bars from the inside.

The days on the river had not been without their physical effects upon Jack and me. The coffee to which I was not used upset my stomach, and it took time to get in focus for the grease which Jack put into even fat fresh beef for a pot roast, of which we had several, but by quitting the coffee for strong lemonade—to Jack's disgust!—and standing over my frying pan with ceaseless vigilance, in order to keep lard from my share of the beef, I was able to keep fairly in trim until Jack invested in some "Blackberry Tonic" at Robison's houseboat. I tasted the stuff to the extent of a teaspoonful, and Jack drank the rest, with the result that we were both knocked endwise, the "tonic" being just enough to upset systems that had come to be nicely balanced by the hardship and different kind of strain to what they were used. I was ready to go indoors for a while, and Tiptonville, a cotton town, the only river gate to the Sunk Lands of Tennessee, offered an opportunity to rest and settle down preparatory for the swamp lands of eastern Arkansas; so there I stopped, while Jack went on the twenty odd miles to his destination at Carruthersville with the Obion River houseboat. Almost the last thing he said to me was:

"I'm going to have me a boat next spring, and I'll live on the river next winter. That's the kind of a life for an old man like me. I can repair watches, tinware, and do little bits of carpentering and mechanical work." In an open Jo-boat the river life had not been overly hard; that in a houseboat would be perfectly comfortable, without a doubt, for old Jack, especially in a boat such as he would make.

A river man is oftenest made in just this way; he starts down the stream looking, in good faith, for work, discovers a life so cheap, comfortable and laborless in the homes of the cabin people whom he meets that his heart yearns for it; so he saves and buys himself a cabinboat, or builds it, and a new inhabitant of the river appears.

RAYMOND S. SPEARS.

### More Cases of "It Just Happened So."

IN FOREST AND STREAM of February 13 there is an editorial entitled, "Crockett, Scott and the Coon." It shows that to Scott and not to Crockett was originally applied the coon story, but that it somehow was credited to Crockett, and to Crockett it will doubtless stick for all time. In the same issue—and only four pages beyond it—Mr. Wm. J. Long illustrates the correctness of the editorial contention. Again, when Mr. Brown precipitated the trouble about the red gods, and claimed that Kipling was "all off" in his line about "a couch of new pulled bemlock," and that such a couch wasn't fit to sleep on, and was never the choice of an experienced camper-out—or words to that effect—one had but to turn back a page or two in that very issue to find an innocent correspondent describing his welcome camp bed made of that identical material.

C. H. AMES.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

## In Old Virginia.

### XX.—Woodcock and Miscellany.

AFTER days of continuous hunting Roscoe became pretty well used up.

His greatest difficulty appeared to be an acute attack of that "tired feeling," which would cause him to sit down every few moments.

On the start he would seem able and enthusiastic, but it was run a little way, then sit down, over and over again until I would be torn between pity and wrath.

He exasperated me so one morning by leaving a warm trail to go sit down, that I took a brush to him, applying it mildly. When I next saw him it was at the house where he had gone immediately after the punishment to nurse his offended dignity.

Some neighbors, who had a bird dog, were notified that we needed help, and one morning a young member of the family came over to take a hunt with us, bringing the dog.

The small boy and his companion, as usual, brought me the news of the third arrival. Clattering up to the room, where I was getting into my corduroys, they began in the regular order, the white boy first, as is always the case when the white boy is southern born. No one loves the worthy negro—of all ages and sex—more than the southerner, but though the devotion may be akin to idolatry, the youthful southerner insists on being the head of the procession at all times, and under all circumstances.

It was evident from their hasty approach, and excited appearance that they believed themselves in possession of information of more than ordinary importance, and the small boy began, at once, as the door flew open from their combined assault while the little darkey twisted his face and wrung his hands, impatient to begin on the better story, which he knew he would tell when his turn came.

"Oh, Papa! Dey's a man tums to da' a huntin' wiv you, an' he bringed de funniest doggy I eveh did see. It's all white, wif little spots on it, an', Papa! it laffs all de time."

Rather a remarkable dog, I thought, as I turned to the other boy.

"Hit a jimbah-jawed dawg, Suh, a pointah. Its toofs, dey stick out of hits mouf in front, en' dat wat make him say hit laffin'."

"Taint a jimmy-jaw dog 'tall," was the indignant response, "it a spatty dog, an' it do laff all de time, cause I saw it myself, I did. Tum on Freddie, yes do see the funny dog aden." And forgiving and forgetting as children should—both young and old—they clattered back down the stairs. On going down I found the visitor to be a pleasant mannered young fellow, whom the Esquire called "Jack," and the dog just about what the small boy had described. A little speckled pointer bitch, with the kindest of eyes, but a most sinister looking mouth, caused by a protruding under jaw. "Jimber-jawed," his master called the peculiarity, as had the little darkey, but the expression was an addition to my vocabulary, as I had never heard the word before.

From a front view the little dog's head looked very much like it might be that of a fifteen or twenty pound pike, but as is often the case, we found it a much better character than its general appearance would indicate.

Everything being in readiness we got away at once, leaving our poor, old worn out dog at home to rest up a bit. The first game started was a rabbit, at which the young man and I took a shot at the same moment. We laughed hilariously to see it go end over end for a distance of ten feet or more, like a tumbler turning handsprings, but when we went to retrieve it from the patch of weeds into which it had pitched, and could not so much as find a bit of fur, the hilarity subsided.

It was quite a while before we found game again, but when we did, it was woodcock. The boys, with the dog, were in the edge of a thicket, near the branch, while I was keeping along parallel with them, in the open. The ground had been frozen, but the sun was shining brightly now, melting it and making the walking hard. The dog pointed, and my companions called to me, but as the cover was very thick where they were, and the ground soft and marshy between us, concluded not to go to them, but let them put up the game which I could mark down if it came my way.

Sending the dog in, she flushed a woodcock which came out in the open on my side, turned and flew straight away along the edge of the timber and into the woods beyond. Protected from me by the distance, and from my companions by the trees, it went away unmolested. Following on we found it among the larger timber, and it flushed again just as the dog found its trail. It was my good fortune to be in the best position for a shot, which I made with promptness and success, as much to the delight of my companions as to my own.

Continuing in the woods the little dog again found game signs, which her master at once pronounced another woodcock. Patiently and surely she worked out the trail, which led into a swampy thicket where the weeds and swamp grass were nearly shoulder high, and finally put up another bird. I was close on and had a fair shot, but being a bit excited, shot too quick with the right, making a bad miss, but gathering myself in time made a clean kill with the left. As I smoothed out the soft, brown plumage of the beautiful pair of birds, my sensations were the same as those which pervade the soul of the small boy when he gazes upon his first pair of ret-topped boots, only less intense. We finished out the day pleasantly, and had further success, but the woodcock incident was, by far, the best of it.

One beautiful morning, the Esquire being prevented from accompanying me by some business that demanded his attention, I took the dog and started off alone. Although out of condition, the dog seemed both eager and willing on the start, but after getting quite a distance from the house suddenly concluded that he did not feel like work, and quietly sneaked back home. **The manner, more than the fact, of the desertion filled me with wrath, for it was not until I had hunted back and forth through the meanest kind of cover for nearly**

half an hour, with the expectation of finding him standing birds, that the truth finally dawned upon me. Acting wisely, I should have immediately followed suit, but tired, hot, and mad, I made up my mind that no sneaking, lazy dog should spoil my hunt, and facing about started in to walk up something, if it took all day. "To act in haste, is to repent at leisure," is one of the old saws which has long needed revising. It is often repent in haste, too, as I did that morning after a few miles of about as rough walking as a man could imagine with a warm sun beating down, but repentance did not bring discretion, so I kept at it until high noon without seeing feather or fur.

The truant dog lay stretched full length in the sun, and started up to welcome me on my arrival home, but though I said nothing, he seemed reminded of some important matter needing his attention under the house, where he hastily retreated after one look at my reproachful eye. The small boy's mother was about to start for a walk, but delayed to see that I was duly refreshed and sympathized with, after which she invited me to accompany her—and carry the gun—saying we could probably save my reputation yet. And within 200 yards of the house, inspired by renewed effort by her confidence, I jumped three rabbits, two of which I killed.

"Well, they beat nothing," I said, as we started back to the house after our walk. "Indeed they do," was the encouraging reply. "Why, Auntie will be delighted. She prefers rabbit to any game you kill, and we always laugh because her first question—if she does not see your return—is, 'How many rabbits did he get?'"

As Auntie was a bright little lady, helpful to all, and youthful in spite of her four score and more years, this information was very pleasing. Altogether, the day, which had begun so badly, had been saved.

Having set forth freely and frankly the transgressions and shortcomings of Roscoe the dog, it is but just to him that his fine plays also be chronicled. His ability to cover ground and speed in the field, to which I have referred, was only equalled by the speed with which his master could slide up and down the entire scale from good to infamous. In one short hunt he would have you coveting him as you never coveted a dog; indifferent to him, and longing to shoot him with both barrels, large shot, close range. His general average was good, and he was one of the most beautiful and graceful dogs I ever shot over; but, like good bacon, he ran in streaks, and the streaks were thin and close together.

On one occasion when we had been a-field some time, and he had not endeared himself to me by anything like commendable effort, he found what appeared to be a very cold trail in the edge of a strip of woods about half a mile in width. Without a break he worked on that cold scent—which had probably been left early in the morning and it was now noon—following the devious windings in and out through the heavy timber and thick undergrowth, through to the other side of the wood, across a wide, much-traveled road, and half across a stubble field, where he came up with the game—a covey of birds—and this with a gale blowing at right angles with his general course.

On another occasion, after scattering a covey, we were going on to other cover, when the dog, at full speed, stopped as though he had run against a stone wall. We were in the pines, and the ground was covered with heavy matted grass. Backing a few steps, the dog threw his head high in the air, turned at right angles to the course he had been traveling, and walked straight to a single bird, on a wind scent which must have been slight, as the bird was buried deep down in the grass and lying close. The distance we estimated at thirty yards.

On yet another occasion, he performed a really remarkable feat, one that I had heard of dogs doing, but had never seen, that of standing a bird while retrieving. It was late one afternoon when we stumbled on a covey of birds in a pine thicket, which scattered down in the edge of the trees, some of them in what had been a road, now abandoned and grown over with grass and weeds. The first bird pointed by the dog flew straight down the road and was killed. As usual, the dog dashed away at the report, and had the bird almost before it struck the ground. He had gone straight down the road and put up another bird just before reaching the dead one. Returning, he pursued the same route, but when nearly to me slowed up, circled out to the edge of the road, came on a few steps, then went back into the road again, where he faced about in the direction he had come, and pointed a bird, still holding the dead bird in his mouth. Had he been my dog I would have assaulted the man who dared to ask the price at which I'd sell that dog.

The last bit of sport impressed upon my mind was that enjoyed in the snow. Six or eight inches of "the beautiful" had fallen over night, and the sun coming out in the morning made the world a thing of beauty. No one knows the possibility of snow as a beautifier unless he has seen it "far from the madding crowd's ignoble strife." Here, without spot or blemish, it lies spread over the land, covering unsightly bare places, rounding sharp angles, transforming blackened stumps into marble pillars—a mantle of pure charity.

The few denizens of field and forest who venture forth add interest without marring beauty by the quaint signs they leave to tell of their passing. We were more interested in the numerous signs of the little folk than anything else, and it was while engaged in trying to find out where the tracks of a rabbit led to that we ran into a covey of birds. They were in a sunny spot, apparently feeding, and scattered on the flush. Paying careful attention to a pair getting up together near-by, I dropped one straight away, and the other up over my left shoulder as it rose to clear the edge of a near-by thicket. Following the survivors the dog found a single, which flew so straight away the shot was almost like that at a stationary target, but as easy shots were not my forte, I missed with both barrels. The next bird proved to be one of my favorites, going to the left, and was killed. Two more were all we could find, one of which flushed wild and was killed by the best shot of the day, and the other requiring two shots, both well placed, before stopping. But the real fun of the trip was afforded by a rabbit jumped on a steep hillside. The course it saw fit to pursue took it around my companion—the Esquire—and he concluded to do a little shooting. Swinging the big single barrel

down from his shoulder, he took deliberate aim, but holding a little low, only succeeded in throwing about a bushel of snow on the rabbit, which ran on, giving me two long shots, neither of which took effect. It then turned back and ran straight for my companion again, who had made no move to reload his gun. He seldom carried more than two or three shells, and now could not remember the pocket they were in. As the rabbit bore down on him he jerked open his coat and searched pocket after pocket, slapping himself like a man fighting bees, and, failing to find a cartridge, when the rabbit was almost upon him, clubbed the gun and tried to land a blow as it sped by, but without success. That rabbit did not come back.

It was like breaking home ties when the time of departure rolled around. There was so much to leave, aside from the loved ones, and so much to carry, beside what we brought. When every trunk and bag was filled to overflowing, the small boy arrived with his load of invaluable, which just had to go. Some half dozen guns of his own manufacture, a small ladder, a bundle of fish-poles, an iron wagon tire, a dozen oranges from the osage hedge, a live terrapin, an iron plow point, and some dozen or so other articles equal in value and utility, composed his contribution.

On leaving home a walk of two or three blocks was an effort, and now, as I swung along, walking from preference the three miles to the station, I felt that ten miles would only suffice to take the edge off of my keen desire to be out and going. Only two hours had elapsed since breakfast, and yet I was beginning to feel very solicitous regarding the lunch basket containing our dinner, and to speculate on the probability of plenty of time at Danville for supper. All of which goes to prove that my fondness for Old Virginia is not based wholly on sentiment.

LEWIS HOPKINS.

## Ski Running.

AN endeavor to trace the origin of the ski carries one back into the realm of Scandinavian Mythology, where we find the goddess, Skade, as the especial protectress of the votives of ski running. And when one has arrived at this point, he is no nearer the origin of the ski than at the start. It is lost in the depths of the ages. As far as the history or legend of northern Europe goes, the ski can be found playing a prominent part in it. The old Norse Vikings, who are chiefly known to posterity for their deeds on water, were quite as much at home on skis as in their famous drage skibe.

While the ski usually carries, to the American mind, thoughts of Norway, it is also a national institution of Sweden and Finland. Wherever, in northern Europe; the snow falls in quantities sufficient to render ordinary modes of travel difficult, there will the ski be found.

The topographical features of the different sections have resulted in several types of skis, developed from time to time as the nature of the country demanded, and as man's ingenuity suggested, until to-day we have several standards, ranging from the long, narrow ski of Finland, where the country is comparatively flat, to the broad, short ski of Norway, better adapted to the mountainous, wooded country that is characteristic of the western part of the Scandinavian peninsula. This latter type is the one best suited to the long jumping for which the Norwegians are deservedly noted, and is the one copied by the countries of Europe lying outside of the ski's true home.

The greater part of Norway, outside of the vicinity of the cities and towns, is quite thinly populated, extremely mountainous, thickly wooded and subject to very heavy snowfalls. The highways, although exceptionally good, can be kept open during the winter only by unceasing effort; and this on the main lines only. There are numbers of people living from a few to many miles from these main routes that are cut off from the rest of the world by snow-covered roads nearly one-half the year; and to these people skis are an absolute necessity.

Men, women and children use them to travel over miles of trackless, snow-covered land. The laborer uses them to and from his daily work; living, sometimes, as much as five or ten miles away. The children use them to and from school, the mail carrier on his daily round, the hunter on his outing trips; in short, they are used by everyone for every conceivable kind of a journey. Up to a few years ago, in fact, until the open season for hunting big game and the ski running season no longer coincided, the hunter not only made his way to the hunting district on skis, but used them to run big, fast game; and to this day the Lap's favorite method of hunting the wolf is to run him down on skis and kill him in a hand to hand conflict.

The training and experience acquired by the use of skis from childhood necessarily makes the adult an adept to them, and feats are performed every day that appear marvelous to an American, yet occasion no astonishment in a country where experts are common. The covering, in rough country, uphill and downhill, through thick timber and over deep snow drifts, of forty or fifty miles in one day's travel is by no means an infrequent occurrence; and the writer knows of one old gentleman, something over eighty years of age, that can put thirty miles behind him between morning and night.

It was natural that, in time, rivalry should grow up between especially expert ski runners in the same neighborhood, out of which grew the custom of friendly competition on Sunday afternoons, on some convenient hillside, where the contestants met and settled their respective merits, while the neighboring community assembled, in small enthusiastic and partisan crowds ready to cheer their several champions, and to "root" for them much as we do in this later day.

From being a necessity to the rural population, ski running was gradually taken up by the youth of the towns and cities and, thus, another element of rivalry was introduced, town against country; and the urban boy has time and again proven himself the equal or superior of his country-bred cousin. As a sport, ski

running is between thirty and forty years old, when regularly arranged meets were first held.

Since then, ski running has grown wonderfully in popularity until it is now easily the most popular sport in Norway. Meets are held, on Sunday afternoons, throughout the snow season. Some of these are local in character, arranged by and participated in by local clubs, where the principal event is the long jump; others include all the clubs in a certain district and comprise trials of speed as well as jumping contests. Still others are of national interest, and at these are to be found the most noted ski runners of Norway, which is to say, the best in the world.

But the classical event is the annual meet, held early in February, at Holmenkollen, just outside of Kristiania, under the auspices of the Society for the Advancement of Ski Running. This meet was intended to be international in its scope, but it was not until 1903 that others than Norwegians took part in it; yet it is the

on the lake in which the course terminates; and here it is that the multitude congregates, thousands and thousands.

The course is about 500 feet long, laid out on a rather steep hillside and terminating, as mentioned before, in a lake. The lake furnishes a horizontal surface on which the jumper can stop himself after his trip down the incline. These stops are made with a sharp turn, and would do credit to a fancy skater, although made with a pair of eight or or eight and a half foot wooden skis. The course is cleared of trees, stumps, brush and stones for a width of about 100 feet and is as smooth as a Canadian toboggan slide, although not worn down and compact like it. About half way down the course, a wooden step, ten or twelve feet wide is built, extending horizontally some fifteen or twenty feet from the incline and ending in a vertical drop of about six feet. This is known as the jump-off, and, having been built in the fall before the snow, is of

trumpet blast from the top of the course announces the start of the first man.

Here he comes, taking a few fast steps at the start and then letting gravity do the rest, coming faster and faster, one foot slightly in advance of the other. He has nothing with which to maintain his equilibrium, except his agility, and as his speed increases and increases, this is called more and more into play; until, arriving at the jump-off, where the speed often reaches thirty or forty miles per hour, all his expertness is required. As he approaches the brink of the jump-off, he crouches lower and lower until he reaches it, and then with a mighty spring, out into the air he sails, tall and erect. To a stranger to the sport it looks as though he could never reach terra firma again without breaking his neck, but he usually lands safely on the course with as nice precision as a cat jumping from a height and with fully equalled delicacy, and continues his run; still at a furious speed, out on the lake, where he ends with the famous Thelemarksving, named after the district in which it originated, amid the plaudits and huzzas of the crowd. Once, some years ago, a Dane, who was witnessing the jumping for the first time, refused to believe the evidence of his own eyes and exclaimed, after the first jump, "It is a lie."

Sometimes the jumper is not so fortunate and executes a succession of somersaults, that present the spectacle of a myriad of skis and arms whirling around and ending in a tremendous cloud of snow, when he finally stops and gathers himself up, jeered by the crowd. Serious accidents are rare indeed, as during the twenty-five years the meets have been held, only one man has been hurt seriously enough to necessitate being carried from the course. To those of us who witnessed this accident, it looked as though the man became unconscious while in the air, and losing his equilibrium, fell on his head and shoulders and was carried away insensible. A few days sufficed to get him into his normal condition. Several English sporting acquaintances stood beside the writer at the time of this accident, and after the meet, while we were comfortably ensconced in huge chairs before the glowing logs of the peis in the hall of Holmenkollen Hotel, said that what most impressed them was the little effect such an accident had on the courage of the jumpers following.

And so the sport continues, man after man comes down the course at short intervals; each one heralded by a single blast from a trumpet from the top of the hill; some standing, some falling, while the crowd cheers or jeers, as the case appeals to them; some especial favorite getting, possibly, the worst falls, to the disappointment of the onlookers. The jumps vary from sixty to ninety-five feet, measured on the slope, the latter (29 meters) being the record for this course. This is far short of the record for the country, which is 138½ feet (41 meters), and is due to the shortness of the run preceding the jump-off and the flattening of the slope below it, rendering the course particularly difficult. At one of the first meets held at Holmenkollen, there were an unusually large number of falls resulting in a number of contestants registering a kick. They claimed that the jump-off was improperly built and that generally, the hill was impossible for good jumping. One of the judges happened to be a prominent lawyer about fifty years old and much more given to deeds than words, despite his profession, and he exclaimed to the kickers: "I will show you boys that the hill is not impossible," and borrowing a pair of skis from a spectator, made an unusually good run and jump and no further kicks were heard.

It is not altogether the distance that a man makes in these jumps that decides his standing in this contest, but clean work, his command of himself and of his skis at all stages of the performance; a falling jump never being mentioned as a jump.

The long jumping is not to be considered solely in its aspect of an athletic accomplishment. It is an excellent training and is often of great value to a man on trips in unknown districts, where, going down a steep hillside, he may suddenly find himself on the brink of a low precipice.

Besides playing an important part in the daily life, skis have a military value in any winter campaign in northern Europe, and must certainly be taken into account by an invading army from the south, lest it comes to grief. During the last war between Norway and Sweden, in 1814, the former was, by far, the better equipped in this respect, and after a very short campaign, the Swedes learned to refrain from aggressive tactics, except on days entirely unfit for ski running. It might be well to state that freezing weather is essential for the use of skis.

The ski has been adopted as a pastime and as an article of utility in Germany, Austria, Switzerland and Montenegro, the Germans especially taking to the sport. In addition to this, the armies of Germany, France, Austria, Switzerland, and even faraway Japan, have a ski contingent; and the Russian army quite a large one recruited in Finland. All of these military ski runners have been instructed in the use of the ski by Norwegians, except those of Russia, who, hailing from a land that has known the ski from time immemorial, needed no instructors. Not long ago the American papers had a short despatch stating that the guards stationed in Yellowstone Park were furnished skis for winter duty.

In Germany, Austria and Switzerland quite a number of ski meets are held each winter, where attending Norwegians have invariably carried off the international prizes, although astonishingly great progress has been made by all these people.

In Arctic explorations, the ski has been used with good results. Dr. Nansen and his companion, Johansen, on their well-known trip, left the Fram at a point north of the Siberian coast, took provisions in two sledges drawn by dogs and made their way on skis northward to latitude 86° 14". Turning back from this point they proceeded southward to Franz Joseph's Land, and after spending the winter here, intended to make Spitzbergen, and from there get home by vessel, but falling in with the American expedition under Jackson, returned to Norway with them. On the trip of Lieut.

THE HOPREND—SKI-LEAPING.  
From "Thirty Seasons in Norway."

event of the year, and it is the ambition of each and every Norwegian ski runner to carry off a prize from Holmenkollrendet.

The first, and of course, the most valued prize is the King's Cup, given annually to the best man taking part in the meet. One annual special prize is the Ladies' Cup, donated by the ladies of Kristiania, for the best jump made. This meet, like all others held in Norway, is strictly an amateur affair, the prizes being invariably articles and never converted into cash by the winners.

At the Holmenkoll meet, the long distance run is always the first event to be decided. The course is not over a well-defined road but is a mere trail, through dense spruce and pine timber, marked out but a few hours before the start, to prevent the contestants from going over it and becoming familiar with its difficulties before the race. Bits of red bunting are suspended at frequent intervals from overhanging trees to keep the runners on the course.

The distance covered is between seven and eight miles, and is over very rough country. Steep hills from 1,000 to 1,500 feet high, up which the runners laboriously work their way, to rush down the opposite slope with the speed of an express train, is a kind of country to test one's ability on skis. Considering the nature of the country traversed, it is really wonderful how fresh the runners finish; coming in often inside of an hour and a quarter. One of the most notable things about ski running is the small amount of fatigue accompanying it; the sliding stroke giving the runner momentary rest between each step. The writer knows several instances where men have traveled from five to ten miles on their skis to a meet and within a couple of hours' time have entered a race and won a prize.

Some years the awards have been made solely on the time used to cover the distance; while other years judges have been stationed at points of extreme difficulty on the route, to note the dexterity with which each contestant negotiated them, and this information has then entered as a factor in making the awards. In the latter case the country boy has a decided advantage over the city youth, as his every day use of the ski in the woods tends to accustom him to unexpected difficulties.

The long distance run is not largely attended, owing to the inability of the crowd to see more than the start and finish; still there is a goodly sized throng in evidence. It is reserved for the next day, on which the jumping contest is held, for Kristiania to, literally, put up shop and go *en masse* to Holmenkollen.

Early on the morning of the Hoprend, or Jump-in, the stream of humanity commences to pour itself out of Kristiania. Small boys and girls, old men and women, and all the ages between these, are wending their way to the scene of the meet. All sorts of equipages can be seen, from the home-made sled of the farmer to the perfectly appointed turn-out of the well-to-do. It is a truly democratic gathering in, probably, the most democratic country in Europe. The crowd continues and continues, some on foot, some on sleds, in sleighs, on the trolley car, "any old way" to get there, but the largest contingent on skis. As many as 30,000 people have been in attendance at one of these meets.

Both sides of the incline, down which the jumpers are lined with a dense mass of humanity; those of the crowd not finding room here, crowding the ice

course covered with snow. When a jumper arrives at its brink, after coming down two of three hundred feet of steep, smooth hillside, there is "something doin'."

On both sides of the course, in the neighborhood of the jump-off, and extending far out on the lake, are reviewing stands, occupied by the judges and other officials of the meet, press reporters and distinguished visitors. One of these not differing from the others, is the King's stand, and it is always occupied; if not by King Oscar, by his son, grandson or other representative. Incidentally, the royal family is personally well acquainted with the ski; the Crown Prince often

THE HOPREND—SHOWING THE SLOPE.  
From "Thirty Seasons in Norway."

making winter trips in the mountains, and one of his sons having taken a prize at a Swedish meet, not by virtue of his position, but because he won it.

Members of the Storting, or Congress, men in high judicial positions, eminent lawyers, doctors, educators, theologians, representatives of the Army and Navy, prominent merchants, large land holders and foreign visitors in large numbers are all to be seen at this meet. The tall, erect figure of Dr. Nansen, of Arctic fame, is easily singled out from the crowd. He is always there, his favorite method of getting there being a pair of skis. This is probably the most representative gathering to be found in Norway.

While the officers in charge of the contest are making the final preparations, the last of which is a run down the course by three or four well seasoned veterans, the waiting crowd below is impatient for the proceedings to begin. They have not long to wait, as soon a

Peary that resulted in the discovery of the northern boundary of Greenland, a Norwegian named Eivend Astrup, accompanied Peary on his travel over the inland ice, Peary on snowshoes and Astrup on skis.

Skis were introduced in America a number of years ago, but do not seem to have taken the hold on the popular fancy that their merit warrants. It is true that in parts of the northwest the ski is frequently seen, but it is in sections where a preponderance of the population is of Scandinavian origin. There are in parts of the north many devotees of the snowshoe, but for rapid, easy travel and genuine sport, the ski is far and away ahead of its only rival, the Canadian snowshoe.

Every man that enjoys outdoor life, who will familiarize himself with the capabilities of the ski and the enjoyment to be derived from its use, will find a keener zest in his outings and a new field of pleasure open to him that, I venture to say, he will never give up.

## Captain Keogh.

DURHAM, Kansas.—*Editor Forest and Stream:* Any one who has followed Cabia Blanco's pen and who himself lived in the West, must give him credit for wide experience. His realisms are not the realisms of the usual faker of Western life yarns. The difference between one who knows and one who draws solely on his imagination is plainly seen in every line. Cabia Blanco so plainly shows in his letters the man of experience that I have come to look upon him as an authority on Western army life. It is for this reason that I deem it worth while to call attention to some slight errors he makes in his letter on Captain Miles Keogh. He states in reference to him at the Custer massacre: "Keogh's body was found not far from where Custer lay, within the circle where they made their last stand." Now, the fact is, Custer and Keogh fell as far apart as it was possible for two men to fall on the same field—perhaps a quarter of a mile. Neither is there any evidence that Custer charged "the biggest Indian camp on top of ground." As far as any actual knowledge goes, Custer never got nearer than within one mile of the camp. The battle was not fought on a circular field, so far as Custer's men were concerned, but on a long narrow ridge flanked by deep, narrow and impassable gullies. Keogh filled the gap between the gullies at the south end of the ridge and Custer at the north end. Thirty-eight men fell within a few feet of Keogh, and fifty-six in Custer's group. Between, and perhaps one-fourth of a mile long, was a scattered line, doubtless engaged in preventing anyone from crossing either gully. It was the only spot anywhere near where a like defense could have been made. The men, without doubt, held the ridge until the last man was shot in his tracks. The picture of the Custer battle that was destroyed by a fanatic was destroyed at Topeka, Kan., not Lincoln, Neb. I have seen a great many pictures of the Custer battle, but never yet saw one by an artist who had taken the trouble to go and look at the field. Even now I have just read of a picture by Chas. Russel, the "cowboy artist." Cowboy artist sounds good, but the review tells about the Indians being in the foreground, circling round the doomed band. It looks odd to have horsemen circling along a line; and then, how about crossing those gullies? Did they bridge them?

## Natural History.

### Owls and Hawks.

*Editor Forest and Stream:*

In your issue of December 26 last, your contributor, Sandy Griswold, entered a vigorous defense of the owl, the hawk, and the crow, and while predicting the ultimate recognition of their existence as beneficial to mankind, demands for them the interposition of protective laws. Now, I am not an ornithologist, nor has my area of knowledge or observation been so extensive as that of your correspondent, hence I cannot throw down a gage of battle upon the subject; but, presuming that before the law is invoked, or rather enacted, a bill of full particulars is essential, I beg to offer a few suggestions.

In the first place, I think some weight should be given to the question as to how far these birds, or either of them, prey upon other birds which in turn are destroyers of insects, worms, and other things destructive to growing crops. If man occasionally succeeds in destroying the owl and the hawk, in particular, that in turn destroys insects, and thereby demands condemnation, how much more to be condemned are the owl and the hawk that destroy not an occasional small bird devoted exclusively to insect destruction, but hundreds and probably thousands of such small birds. Weighing up the insects and worms actually destroyed by the hawk and the owl as against the insects and worms actually destroyed by the small birds whose lives have been ruthlessly terminated by the hawk and the owl, on which side will the balance be? The poor crow is exempted from the realm of his two murderous friends.

From time immemorial the hawk has been known as a constant and watchful hanger-on about the poultry and barnyard for the purpose of picking up and making a meal of any stray chicken that may come within the reach of his talons. At the farmhouse where I am staying a brood of thirteen healthy chickens, hatched this winter, were from time to time reduced in number by a vigilant hawk, which kept watch upon the premises until only five were left to tell the tale. The bird was frequently seen while on the watch for his prey, but in the absence of firearms his depredations were unrestrained. Accepting Mr. Griswold's verdict, this hawk was an inestimable blessing.

Again, in my hunting excursions, I have several times come upon hawks engaged in devouring quail they had captured. I have also found coveys of quail scattered by the attacks of a hawk, and I am told by those more experienced than myself that hawks often destroy more quail than an ordinary sportsman. It is generally admitted that the sparrow-hawk feeds almost exclusively upon small birds, which in turn would destroy an in-

calculable number of insects destructive to growing crops.

I know little of the habits and feeding propensities of the owl family. The little screech owl is best known in my neighborhood. Of his capabilities as a destroyer I will relate two or three incidents. Within a mile of my residence a farmer was disturbed a few weeks since by a noise in his yard. Going out to ascertain the cause he found a struggle going on between a screech owl and a guinea-hen. The owl was fastened upon the neck of the struggling guinea-hen, biting it savagely. On his going to the rescue, the owl flew away. A night or so afterwards the same farmer heard a noise in his hen-house, and discovered a commotion among the fowls, and a dead guinea-hen lying upon the floor, while on a perch above sat a small screech owl which had undoubtedly caused the trouble. He was speedily dispatched. Here was another "blessing" whose career was summarily ended.

A farmer's wife, who lives almost in sight, stated some time since that she saw a screech owl kill her big red rooster while it was roosting on top of a coop. A young man of this family was disturbed by a noise in the hen-house one night and found a dead hen lying upon the floor, and by its side a small screech owl which had bitten it in the neck and killed it.

These are incidents of recent occurrence, and it seems to me apparent that further investigation would in all probability multiply their frequency. I beg, therefore, to exempt the little screech owl from proposed legislative protection. His sharp bill and vise-like jaws that snap together with such ominous significance, are too dangerous to be abroad without some restraining influence.

OLD SAM.

## A Disappearing Game Bird.

CIVILIZATION seems to be the great destroyer. Westward the trend of empire takes its way, and before its onward march, remorseless as fate, the wild things flee. Behind lie the wrecks of once happy conditions for the game. Gradually, but none the less surely, that greatest of all game birds—the wild turkey—has faded away, until now only a few isolated specimens are to be found in favored localities. Our fathers thought that this bird never would become extinct. The bison followed in the wake of the turkey, and now science will in a very short time chronicle the fact that the great sage grouse (*Centrocercus urophasianus*), once so plentiful on the great plains, has gone to keep company with the turkey and the bison.

I can recall the time when this bird, next in size to the wild turkey, was a very familiar object on the Artemisia plains of the Northwest. This was particularly the fact in the Great Bend of the Columbia River in what is now the State of Washington. My first introduction to the bird was in the summer of 1883, when this region was being settled up. Hundreds of home-seekers were flocking there from all parts of the United States. Caravan after caravan left the nearest railroad station, Cheney, to find locations upon these fertile prairies. It chanced that I was among those in the van of the rush. The last day's drive brought us to the Grand Coulee, and water—something not the easiest to find, by the way. That night we camped beside a large spring that came pouring out of the basaltic cliff and the edge of the Coulee. Everything was green for yards around, forming a striking contrast to the dried-up appearance of the usual landscape of bunch grass and sage brush. As the evening shadows drew across the gray landscape, we were startled by the whirring of a thousand wings. Looking up we made out against the lighter sky the great dark forms whirling down upon us over the hills. They settled right in the camp ground and fearlessly walked to the little rivulet made by the gushing spring. Others followed until the ground was dotted with them. Each slaked his thirst at the water and then flew away to the distant hills again. The next day we were all day in the country of the sage grouse. He was on every side of us; sometimes barely getting out of the track of the wagon. Be it known we were not following any laid out road, but driving across the bare plateau, following the section lines by compass. Nearly every bunch of sage brush had its resident. There were many of them only half grown, and not a few coveys just hatched, although the month was September. At that time I was too young to more than have a passing interest in the birds. Since which time, however, the love of all the works of the Great All-Father has been developed in my breast, and I have spent many happy days in study of our winged friends.

I had an especial opportunity to study the sage grouse one winter when located in the Great Malheur country in eastern Oregon. The bird was there, as in the Great Bend, in all its native wildness, unfettered by civilization. Wandering bands of cattle were the only people of these plains, tended by a few range riders. Every day and every day as we rode the range, great dark birds would spring out from under the horses' feet and rocket away across the cañons. They fed almost exclusively upon the sage during the winter, and their flesh was somewhat over-seasoned with that pungent herb. It made an addition to our usual bill of fare of salt pork, however, before spring. We discovered a method of extracting some of the sage taste. After plucking and disemboweling the bird, we dipped him in a basin of hot water for an instant, then swathed him in a wrapping of hot cloths and buried him in about two feet of earth for twenty-four hours. Upon disinterring, the toughest, sagiest old grouse on the hills was found to be—well, not as tender as spring chicken, but then vastly improved over what he was before his burial.

When the springtime swept the snow from off the hill-sides, the male grouse chose their trysting place and laid out their amphitheatre. It was usually upon some knoll, bare of herbage and commanding a good view of the surroundings. There, upon early mornings, several of the cocks gathered to sing their love songs and unite in a wild quadrille that somehow seemed calculated to charm the hearts of waiting damsel grouse, who sat around and seemed to enjoy the show. It was my pleasure at different times to be also an audience of one at these entertainments. I wasn't invited, but as I made myself very inconspicuous, it did not seem to matter much. It is hardly fair on my part to give the snap away, but this love making is so amusing—much like any other love making—that I cannot resist the temptation to tell your readers

about it. More so, perhaps, because it is now a rare thing to see these birds making love on their native heath.

The gray dawn was just breaking over the eastern hills when I stealthily slid into my place below the knoll that the birds had chosen for their courting ground. The first to arrive was a big fellow who already was all aglow with the ardor of his love. He plumped down upon the bare ground and sat still for a short time, then began sedately to pace up and down the hillock. He did sentinel duty thus for perhaps five minutes. Then throwing back his head he gave vent to a deep guttural note that is impossible to describe. At the same time he filled the air sacks on either side of his neck until they stood out larger than oranges and much the same color. The row of black feathers that usually hid these sacks now stood up above them most comically. At the same time his magnificent black tail was spread and swaying from side to side. In this manner, and with head drawn back almost touching his tail feathers, he did a two-step up and down the ballroom. After side stepping in this manner for several feet he stood in one place and danced up and down, all the time giving utterance to a series of growls, that, while they were evidently very charming from his point of view, were a little like the efforts of a Chinese band—one had to be educated to that sort of thing to properly appreciate it.

As the sun rose over the hilltops, the knoll became the scene of great activity. They kept arriving by the score, and soon the spot was one mass of performing birds. The hens, too, arrived and sat demurely in the bunch grass just off the stamping ground. Each cock chose his mate, and they wandered away into the sage brush, no doubt whispering soft nothings to each other in the most human manner.

The nest of the female is made under a sage brush right out on the bare plain, with very little if any attempt at concealment. The bird seems to depend upon the protective coloring with which nature has endowed her for concealment from the natural enemies of her existence—the coyote and the great owls that infest these plains. Numberless times I have almost trod upon the setting birds without seeing them, so nearly does the coloring blend with the dead gray of the surroundings. In fact, one day while watching a band of cattle upon some distant hills, I chanced to glance down at my feet, and detected a pair of bright eyes watching me intently. Even then it required careful scrutiny to be sure that there was a bird belonging to those eyes. I purposely looked away for an instant, and upon looking back again, although I had not changed my position, it was fully a minute before I could again locate the bird. The eggs are usually nine, although I have seen clutches of thirteen quite frequently. The eggs are in color a ground of olive plentifully splotted with umber brown. The coloring matter is not a part of the shell itself, as it can be very easily removed, leaving the shell a dirty white. The incubation seems to be carried on by the female solely, as does also the care of the young. At least I have never seen the cock taking the slightest interest in the care of the family. The old bird, like all of the *Phasianidae*, is an expert in luring an enemy away from her young, simulating lameness very realistically; at the same time the youngsters are scuttling for cover.

The food of this bird is much the same as that of the other members of the family—grains and grass seeds with an occasional beetle and grasshopper. They do not seem particularly partial to the *Artemisia* except when other food fails them. I have killed many right in the sage belt without finding a trace of the sage in their crops.

I don't know, owing to the scarcity of this bird, that it is exactly fair to mention anything regarding them from the standpoint of the sportsman. In former times here in the West when they were plenty we used to find great sport shooting them; especially in the fall, when the young birds were about ripe. They lay well to the dog. In fact, at the time of which I write, they were, if anything, too tame. I have had them flush right under my feet with the dog at a point almost over them. It is somewhat disconcerting, though, to have one of these big fellows jump up right under your nose and go booming away like a small thunder storm. The flight is very rapid for so large a bird, and once fully on the wing they pitch through the air very much in the manner of a Mongolian pheasant. They can stand a heavy load of shot carrying away a load of chilled sixes without ever turning a feather. The best load was chilled fours, driven by at least four drams of powder.

CHAS. S. MOODY.

## Feed the Squirrels.

*Editor Forest and Stream:*

Let me urge the readers of FOREST AND STREAM to place nuts where the squirrels can find them. A tragedy has happened almost beneath the shadow of my eaves which I would spare others if I might.

All last winter my eyes were gladdened by a pair of red squirrels which had their nest in a chestnut tree near the house. The first thing that I saw as I looked from my bedroom window in the morning was one or both of these beautiful creatures skurrying along across their elevated road from tree to tree. Up and down they went, with great frisking of tail, the very symbol of life. The male was a perfect beauty; not exceptionally large, but much lighter in color than the generality, and of a lovely bright hue, as if he were the very offspring of the sun. He was my delight, the apple of my eye, and stood as a symbol of the wild life amid close crowding conventionalities. I would gladly have given him anything which his little squirrel heart might crave. I longed to stroke his gleaming back, but never thought to hold him in my hand. Yet yesterday I did hold him—dead; starved to death, poor dear, *ma culpa, ma culpa!*

All winter long I have been on the lookout for this pair, but caught only the rarest glimpses of them, and thought that they were nesting in a neighbor's trees. Now I know that the cold was so severe that they staid within doors in their tree. I must confess that I had not expected this. A week ago my son found one of the pair dead beneath the tree nearest my bedroom window. Yesterday as I started abroad with a bucket full of black walnuts to read the tracks in the snow if I might, I found my beautiful sun-child dead at the basement entrance of

his tree. Starved to death, both of them, beneath my eyes, and I would gladly, to save them, have filled their tree with nuts, all too late now to count as merit.

Two years ago, at the time of the great storm, as I cleaned up the wreckage with my ax, I came across a maple bough gnawed clean of bark by this same pair, or one of them. Oh, dull of apprehension! This should have told me of their starvation hunger in far earlier days. I saw only the desire of a more varied bill of fare.

This has been a winter severe beyond the recollection of any squirrel living hereabouts. Long since their granaries and magazines of food, their chestnuts and their walnuts, have been exhausted, and this little pair, the most interesting of neighbors on a college lawn full of gleaming interests, was sacrificed to sheer stupidity on my part. I did not know they were there in a tree beneath whose branches I slept. Perchance this letter may induce someone to scatter nuts, not letting a night intervene between his intention and his act, and so save a pair or two of these adorable little beasts—a gleam of the wild life amidst the routine of the civilized. Also a pound of tallow hung in the branch of a tree near the house may prove grateful to the birds, and repay with a glimpse of unusual visitants.

I might note that ten days ago I saw here a solitary catbird, mistiming its northern flight, and doubtless, too, long since starved to death. Trusting that some other squirrel lover may chance to read this and be saved from a like bereavement, I remain,

ALDEN SAMPSON.

HAVERFORD, Pa., Feb. 16.

## United States Biological Survey.

THE recently published report for 1903, by Dr. C. Hart Merriam, Chief of the United States Biological Survey, contains much matter that is interesting to sportsmen. As is well known, the work of this survey is divided into three branches, of which the first relates to the geographical distribution of animals and plants, and the determination of the life and crop belts, matters of the deepest interest to farmers. This is in charge of Dr. Merriam. The second has to do with the economic relations of birds to agriculture, which is in charge of Dr. F. E. L. Beal; while the supervision of matters relating to game preservation and protection and the importation of

foreign birds and mammals is in charge of Dr. T. S. Palmer.

Under the operations of the Lacey act, a close watch has been kept on interstate commerce in game, and in this matter the survey has had the assistance of the game commissioners and the wardens of a number of States. Some convictions have been had. Much attention has been given also to the new Alaska game law, which has been so often misunderstood. It is thought that the wholesale shipment of deer hides has wholly ceased.

At the request of the American Ornithologists' Union and the Biological Survey, the President in March, 1903, set aside a small island in the Indian River, Fla., as a reservation for the protection of native birds. This island which is less than four acres in extent, is occupied in the breeding season by from 2,000 to 3,000 pelicans, which in past years have been much disturbed by the public. Every effort is now being made to preserve the colony. An interesting account of this island is to be found in the last New York Zoological Society Bulletin (No. 12), from the pen of Mr. C. William Bebee, curator of birds for the society.

Naturalists have long felt the need of a complete and modern index of the family and generic names of mammals. Such an index has been prepared by Dr. Palmer, and is now in press.

During the coming year the field work will continue in California, and some of the forest reserves on the Pacific slope will be visited for the purpose of determining their fitness for game refuges. It is hoped that a home may be found for the herd of Kern county elk—sole survivors of the elk in California—which has been presented to the Government by Messrs. Miller & Lux. No appropriation has been as yet given for moving this herd, a bit of shortsighted parsimony on the part of Congress which is greatly to be regretted.

The field work of the naturalists will continue, as will also the study of the economic relations of birds to agriculture, especially with relation to the products of California. It is thought that the bulletin on the food habits of the woodcock and upland game birds will be published before long. The study shows that game birds do comparatively little harm to crops, and that they consume large quantities of injurious insects and noxious weed seeds. Efforts will be made to secure information regarding the abundance in certain localities of birds that

are known to be becoming scarce, such as the woodcock, the woodcock, and the upland plover. Continued attention will be paid to the Lacey act and to the Alaska game laws, and new regulations with regard to Alaska are likely to be issued. The caribou of the Kenai Peninsula are becoming scarce, and a close season of five years will be established for these species.

## Back-Tracking Horses.

WELLS, Wyo.—*Editor Forest and Stream:* It is my opinion that a horse back-tracks partly by scent, partly by sight, and a whole lot by sense of locality. Just as some men always know where they are, so do some horses. And a horse has the advantage of his scenting powers. A horse has a better nose than most people think. It is a common thing to see a range horse which has lost the bunch trailing it up, nose to the ground, like a hound.

I never had but one back-tracking horse that was always right. He was a little gray, and he not only always knew where camp was, but where the rest of the horses were. Some horses can never be turned loose at camp and trusted to hunt up the bunch, but I never had to worry about Crowfoot. And if he went over a piece of ground a second time he always went just where he had gone before.

Many horses can always find their way back, but will not follow the trail. My best hunting horse was this way. The first down hill he came to on the back track he would, if let alone, pick out as easy a trail down as he could, and from that on would follow his own sweet will, with the result that he sometimes got into awful country. But he would find camp sooner or later. By the way, some time ago there was some talk in FOREST AND STREAM as to a horse's swimming powers. This horse, which was a thick-set little fellow, with tremendous width of chest, would swim so high with me in the saddle that it was a rare thing for water to come over the saddle scat. I never remember getting wet above the waist while swimming him. Another horse I had would, while swimming, go clear down till only his nose showed, then come up with a surge half way out of water. Nearly all horses can swim, but some will not, and will drown just as soon as they lose their feet.

WM. WELLS.

## Life in the Woods.

### IV.—The Old Camp at Echo Lake.

A PEARL set in emeralds. A crystal framed in green. A dew drop in the hollow of a gigantic leaf. A mirror over which even Venus, in the mystic flight of the great gods and goddesses of mythology, could have hovered and viewed with delight her perfect charms. In an ideal spot in a sheltered nook on the shore of this gem of nature stood the old camp. Facing to the south the lake stretched out before it and from its shores, perpetually green, it sent back the echoes until they came hurrying to the listener at the camp in almost endless procession. To the north, northeast and northwest lofty rocks and hills barred out the cold blasts, the advance guard of the army of old winter as he moved down to take possession of his chosen realm. No marks of civilization here. No signs of work by the hands of man. Nothing but the handiwork of time.

There the old camp stood for many long years until the log sides and bark roof were garbed with moss and vine, until decay from light attacks had gained an almost complete conquest. Winter, spring, summer, and autumn passed in an endless procession, but the old camp stood. Storms came only to be succeeded by sunshine. The cyclone passed over it, tearing the tall treetops into atoms, and piling up the sturdiest growth of nature into confused masses, but the old camp in its security laughed at the rage of the elements. There it stood as first built, its doors always open for hospitable shelter. The years rolled on and brought with them the iron way which sent trains hurrying along only a short distance away, carrying with them the stream of trade flowing to and from the great commercial centers, but the old camp and its surroundings stood unmolested. One generation succeeded the other, and the son, grown to manhood, stood where the father had been, but the old camp, grown older, stood there still. By its side before the silent lake who of those who stop to think could hardly help feeling the inspiration which nature in her primitive form creates? The thoughts of the wondrous power of creation! Near twenty years the old camp stood—near twenty years it sheltered, from time to time, the hunters and their friends. It saw them come young, strong, active, lithe, eager for the spoils of the chase. It saw them come when time's changes were only too visible, when age had bowed the frame once so straight; when the lapse of years had frosted the hair and whitened the beard. When no longer active, and eager they came more to live over old times than to revel in the success of the chase. It saw the old muzzleloading guns give place to the breechloaders, and they in turn to the wicked repeaters.

It saw the wolf, fox, and bear, shot, trapped, and poisoned until only a few stragglers now and then were left. It saw the sportive muskrat, the agile mink, and the busy beaver vanish from its view forever. It saw the timid deer, which for many years had been its constant visitor, become almost exterminated. It saw the fish that sported in its waters give way to nets and dynamite. It saw the invading lumbermen sweep through the forest, leaving a pathway of utter desolation behind. It saw the water-courses where the bubbling spring found outlet to the rushing river's side become dry and useless, and then it beheld the red blast of hell descending upon it. The next fall when the old hunters came to their favorite spot they found a mass of charred sticks and ashes. Miles of black, barren burnings stretched out before them, and they saw that the primitive wilderness had passed away—aye, even as man lives and dies; and who knows but as they turned away something swept over them akin to that feeling which plays upon the human heart when the angel stands over some of our dear ones, and, taking them by the hand, leads them into the seeming blackness and desolation of that which we call death.

Around this lake, and within a radius of a mile or more about the old camp, was good ground for still-hunting and driving, and the first thing that morning was the Echo Lake drive. S. B. and the Colonel were given the choice of taking the stands, and away they went, working up carefully against the wind to their positions. S. B. perched on a high stump where he could command a good view all around him. My, how frosty it was. Every stick stepped upon seemed to snap in the frosty air like a pistol shot, and a man, when he attempted to travel where the brush was thick, made about as much noise as a yoke of oxen would under ordinary circumstances. It was a cold morning for those upon the stands, but a glorious bracing day for those who were moving. It seemed as if a deer must surely be killed on such a day. Time wore on and no gun cracked. We had nearly reached the stands when bang ca-bung went S. B.'s old shower gun, and pretty soon, "Hurrah! hurrah! I've got him, boys," as S. B. shouted for joy. In a minute more I could see him standing on his stump, with his hat on the end of his gun barrels, waving it over his head, and shouting vigorously. It did not take me long to reach him. "What have you got?" I asked, as excited as he was. "Don't know what it is, but it lays right over there," he replied. I went over there, but couldn't find anything. "Where is it?" I asked again. "Why, right over there by that bush. It's a little deer—a mighty little fellow. It came sailing along like a bird, and at the second shot I knocked it down right over there," pointing to near where I stood. I looked again, but in vain. "Can't you find it?" anxiously queried S. B. I shook my head. "I will come over there and step on

it for you," and he came. He looked all around. The Colonel came and looked. Mack came and looked. The Old Trapper came and looked. We all looked, but no deer did we find, nor was it ever found. Didn't S. B. feel badly? He wouldn't give it up, and so we circled and crossed and crisscrossed. We got down on our hands and knees, the snow having melted, and searched over every inch of ground and were finally rewarded by finding a few drops of blood, showing that the deer must have been struck and knocked down with buckshot, but the wound did not prevent its getting up and running off unnoticed while S. B. was putting his hat on the end of his gun and shouting for the benefit of the rest of us. The Old Trapper had lots of fun over this ending of the "drive," because S. B., in previous years, had a somewhat similar joke on the Old Trapper, which I will try and relate later on.

It seems while going to his stand that morning S. B. had started two fawns, which apparently had not been much frightened, and had not gone far, so we immediately formed a conspiracy to assassinate them both. They were supposed to be located along a small creek bottom, so we arranged to come Indian on them and surrounding the locality all worked toward a common center. It so happened that when we closed in I was next to S. B., who was about thirty rods or so on my left and above me on a ridge while I was below in the creek bottom. I had just located him when I saw the white tail of a deer ahead of me, and looking sharply I could see one of the fawns standing still. I was just throwing the gun to my shoulder when a noise startled the deer, and away he went; the brush being too thick for a running shot, I looked ahead a few rods, when bang went S. B.'s rifle, followed a moment later by his shotgun barrel, and the buckshot rattled in the treetops ahead of me like a first-class hail storm. I waited and watched, but neither hearing nor seeing anything I walked slowly to the place where S. B. had fired and found him searching the ground carefully for hair or some signs of blood. He couldn't seem to find anything satisfactory. He pointed out the spot where the deer was running when he fired, and explained: "Here I shot at him first with the buckshot, because the brush was so thick and after he got off there, more in the open, I let the rifle go at him." He had it wrong, for according to the sound of the reports and the rattle of the buckshot he had fired the rifle first and then the shower barrel. But he couldn't believe it, and said: "Tut, tut, it can't be; I am sure I am right." The others, however, were all against him, and as it was a case of four to one, we held we were right. He would never admit it, but at all events, the deer kept on going, and is probably going yet, if it has been permitted to escape the army of hunters that at times infest the woods.

No one should imagine from this that S. B. was a

novice or a poor hunter. Far from it. Few ever went into the woods who had better records, and although he had seen the suns of over seventy-five years rise and set, he had never failed yet to get more than his share of the game. It was on this account that we liked all the more to bother him about these two incidents of the hunt. No better luck attended our efforts the rest of the day, and once more, when evening came, we gathered around the ever welcome supper table. That night we were joined by Louis and a comrade whom we called Hub, and a joyful reunion we had.

They had been hunting in Michigan, and had shot only one small deer, and as the open season had expired in that State, they had come over to visit us and finish their hunt. That night, as their baggage had not come over, they slept on the floor in the camp, and found all the lumps and hard places in it, for they were stiff and sore on awakening in the morning, but nevertheless started out on the hunt with us. Hub, Louis, the Old Trapper, and myself took the stands while Mack and the Colonel made the drive. It took us about half an hour to reach our stands, which were not far apart, except that I was separated from the others by a high ledge of rocks. I had not been at my post over five minutes when I heard two shots fired rather quickly, and then two more in quick succession, followed by two more not quite so close together, and evidently nearer to me. I squared myself for a rally on my own account, when another shot rang out, and then all was still. As the boys say, I peeled my eye, but I didn't see anything. I listened, when my heart didn't beat so loud as to drown other sounds, but nothing could I hear. I was on the anxious seat, and more than once was tempted to leave my stand and go and find what it was all about. Knowing, however, that this would only give the others cause for "roasting" me, and that the deer might come through at any moment, I stuck to my place for thirty minutes. At the end of that time I heard a whistle, and going toward the sound found the entire party holding a sort of post-mortem over the carcass of a large buck. It seems Hub fired the first shots. He had hardly settled himself on the spot he had selected when he saw a big buck trotting toward him. He had a double-barrel shotgun, and when the deer got pretty near to him he aimed at his pate and let go. With this the old fellow whirled and ran toward Louis, and Hub gave him the second barrel as he jumped away. Louis saw him coming and opened fire with two shots. The buck still moved on, and getting opposite the Old Trapper the latter knocked him down with two shots, and as he still kicked around a good deal, finally killed him with a bullet through his neck. It is a question, which has not been fully settled yet, as to who is really entitled to the honor of getting him. There were three or four holes in him beside one buckshot. He was a rouser. The six of us tackled him after he was dressed and dragged him to Echo Lake, and from there we rafted him to the other side. We then made a litter and carried him about a mile to camp. Every man was more or less weak-kneed when we got in. We had to cross the Pembine with him, and had to do it on a fallen tree, but, as might have been expected, we all got in. The Colonel rigged up his kodak and took a snap shot as we were struggling in mid-stream, but unfortunately the picture failed to develop. The buck had a very large and peculiar pair of horns, and an examination showed that Hub's first charge of buckshot had rattled around his head like so many peas. They grazed his horns in several places, and bounded off his head and neck without doing a particle of damage. We asked Hub why he shot at such an iron-clad spot, and his explanation was that he thought he might at least be able to put out his eyes. That hunt used us up so much that we did little else the rest of the day except to eat, clean up camp, and get some wood cut in anticipation of cold and stormy weather.

CAROLUS.

[TO BE CONTINUED.]

## Game in the Yellowstone Park.

THE winter condition of the game in the Yellowstone Park possesses a special interest to all naturalists and game lovers, and the knowledge and interest of the public in this subject was greatly stimulated by the visit to the Park by President Roosevelt in April, 1903, which was so widely heralded through the press of the country.

We are kindly permitted to quote from a private letter, recently received by a gentleman in this city, from an officer who spent most of the winter in the Park. The news which it contains is most interesting: "We had a most delightful winter in the Park with very little snow and no extremely cold weather up to the time I left.

"The buffalo are doing finely, and I shall be greatly disappointed if there are not from fifteen to twenty calves in the new herd this spring. It is intended to catch up all the young calves that can be captured from the wild herd. Those secured from the herd last spring have done exceedingly well and are now running with the new herd. They were reared by a domestic cow—very much against her will.

"Game of all kinds in the Park is in fine condition, and no matter how much snow falls now, it will pull through the winter in good shape.

"Eighty-four sheep have been seen on Mount Evarts, and preparations have been made to feed them all the alfalfa they may need, in case of a deep fall of snow. They have been fed a little from time to time in a corral built for that purpose, so that they know where to go in case they get hungry.

"Fourteen lions have been killed off the sheep range this fall, and these captures are likely to add considerably to the peace and comfort of the sheep.

"The antelope have also been fed a little, with the view of keeping them also where they can find something to eat, in case their natural supply should fail them.

"It would be a good idea to feed a large proportion of the game along the northern border of the Park, and if he had the hay, Major Pitcher could keep a herd of about 1,000 elk on the hills just back of the Mammoth Hot Springs Hotel during the entire winter, and probably until late in the spring."

The continued well being of the game in the National Park is most gratifying. Major Pitcher's heart is in

his work there, and he has an admirable force of men to help him. Still more efficient is the fine public sentiment among the residents of Montana along the northern border of the Park, which leads them to feel a pride and satisfaction in the well being of the game, and makes them Major Pitcher's most efficient aides.

## The Adirondack Bears.

ELIZABETHTOWN, N. Y., Feb. 15.—*Editor Forest and Stream:* Inasmuch as certain sentimentalists are chasing rainbows, advocating that all city men, all Essex County guides and hotel men are in favor of protecting black bear, and also that plenty of bears will be killed here by "sportsmen from the city" in the fall, once bruin is protected during the summer months. I ask for space in your valuable medium in order that the false impressions above noted, may be pointed out.

Last Saturday I took the trouble to drive two miles west of this village for the purpose of interviewing James Darling, Elizabethtown's most venerable and successful bear hunter and trapper. He was seventy-seven years old last month, and during the past forty-five years has captured 39 bears, 36 of which were caught in traps. The 3 bears he got outside of traps were cubs which lingered near their mother after she was caught in a trap. The cubs took to a tree on Mr. Darling's approach, and he shot two of them and captured the other one alive. During his hunting and trapping career of half a century he says he never got a shot at a bear outside a trap, excepting the cubs above mentioned.

During the past thirty years 125 bears have been killed here in Elizabethtown, an average of a little over four each year, and only eight have been killed outside of traps. And none of these eight were killed while being hunted in the woods, but rather in sheep fields, apple orchards, etc. Does this look as though it would be a good plan to abolish trapping bears, or does it indicate that men could come up here from the city and kill bears with rifles?

City cottage owners in Essex County, almost without exception, are opposed to protecting the black bear at any season of the year. The following Essex County hotel men have declared against the absurdity:

O. Kellogg & Son, The Windsor, Elizabethtown.  
B. F. Stetson, Deer's Head Inn, Elizabethtown.  
G. W. Jenkins, Maplewood Inn, Elizabethtown.  
George H. Smart, Pine Grove Cottage, Elizabethtown.  
Laverty Brothers, Hunter's Home, New Russia.  
Case L. Patten, The Westport, Westport.  
W. H. Tracy, St. Huberts' Inn, St. Huberts.  
G. W. Egglefield and Son, Tahawus House, Keene Valley.

James Flaherty, Hotel Halcyon, Keene Center.  
Charles Bullis, Lewis Hotel, Lewis.  
John McGuire, Commercial House, Keeseville.  
Fred Hinds, American House, Ausable Forks.

All the members of the Keene Valley Guides' Association, the oldest and largest organized body of guides wholly within Essex County, have signed a protest against protecting black bear, "believing," as they say, "that legislation to protect black bears is unwarranted and uncalled for, and against the best interests of the region in which we live," etc.

The protest is signed by Le Grand Hale, Harry A. Beede, George F. Beede, C. Wesley Lamb, Charles O. Beede, O. E. Beede, Arthur C. Trumbull, Fred Lamb, Charles W. Trumbull, Frank H. Holt, Melville J. Trumbull, Edmund F. Phelps, Enos Sanders, John K. Brown, Jas. Owens, B. S. Pond and W. Scott Brown, the last named being Superintendent of the Adirondack Mountain Reserve and an honorary member.

All the Elizabethtown guides are most emphatically opposed to bear protection. These men get their living by guiding, and know what is really best for their interests.

Again I say, in view of local conditions and circumstances, if bear must be protected in other sections, please exempt Essex County, as we don't need bear protection in our business here.

GEORGE L. BROWN.

## The Sportsmen's Show.

THE tenth annual exposition of the Sportsmen's Exposition Company, Madison Square Garden, New York, began on February 19, and will close on March 5. The public patronage has been most liberal, and there is every indication that it will be a gratifying success financially.

The vast amphitheatre of the Garden has nowhere any suggestion of emptiness. The numerous exhibits and their accessories tax the available space to its full limitations. An immense tank occupies the central part of the main floor, and the water is of ample depth to float the beautiful launches and automobile boats which ply swiftly to and fro on its surface, or disport themselves gracefully while their mechanical features are exhibited in detail by the experts in charge.

The Fourth avenue end of the amphitheatre, from floor to roof, is occupied by a mountain scene, the numerous peaks of which fade away in the blue of the sky. A mountain stream, after a broken, tumultuous course through rocks and falls, reaches an old mill and turns the old-fashioned water wheel in an old-fashioned manner, thereby giving a most complete touch of realism to the whole. The water passes on to the tank devoted to the needs and pleasures of the wildfowl.

On the first gallery on the north side of the Garden, a long, shallow tank with a platform at one end is installed for the fly-casting contests which take place each day alternately at 3:30 and 8:30 o'clock. The conditions of the different contests in their entirety provide for every recognized use of the rod and reel. The classes and conditions were published recently in *FOREST AND STREAM*.

There is a liberal use of evergreen branches everywhere, with gratifying effect to the eye. The mammoth mountain scene and the green touches of color everywhere add greatly to the pleasing effects of the *tout ensemble*.

A skillful military band fills the Garden with popular music in the afternoon and evening.

The special features which appeal most directly to the sportsman are the game bird and wildfowl exhibits, the fish hatchery, the fly-casting, the wilderness camps, the taxidermists' mounted specimens of game birds and fish, the expert rifle shooting of Mr. Stephen M. Van Allen, and last, but not least, the mammoth display of camp equipment and sportsmen's supplies by Messrs. Abercrombie & Fitch.

The New York Zoological Society's exhibit is in charge of Prof. W. T. Hornaday, and is devoted largely to fish, and to a fully equipped fish hatchery which illustrates the different stages of development from the spawn to the fry.

The exhibit of game birds and wildfowl is quite complete, and includes some varieties of foreign birds not exhibited at previous sportsmen's shows. They are owned by Mr. Homer Davenport, Roseville, N. J.; Mr. Timothy Tredwell, East Williston, L. I., and Dr. Cecil French, Washington, D. C. They are in the northeast corner of the main floor.

Mr. Stephen M. Van Allen, of Jamaica, L. I., famous as one of America's most expert performers with the shotgun, has developed phenomenal skill with the rifle and pistol. On the second gallery in the southwest corner he gives exhibitions of fancy rifle shooting which would make William Tell's head collapse. A large sign in his space bears the statement that he always uses greaseless bullet cartridges, and does all his shooting with Winchester rifles. Of the latter, with several pistols, there are different kinds displayed in a case within his space.

The Adirondack camps, with many illustrations of what sport awaits the visitor to those famous regions, are on the main floor in the northwest corner of the arena. A large sign, "Adirondacks," in white birch letters on a background of evergreen, serves as a guide from any part of the amphitheatre.

The Maine exhibit, owing to delays in transit, had not arrived in time for installation on Monday of this week, but it was generally understood that it was excellent.

### Canadian Pacific Railway.

The Canadian guides hold forth in the exhibit of the Canadian Pacific Railroad on the northwest corner of the main floor, under the charge of Mr. L. O. Armstrong, who has been identified conspicuously with the Sportsmen's Show in many successive past years. He introduced the Ojibway Indians with their Hiawatha drama. The camps contain a large and varied exhibit, indicative of the infinite sport to be found in the vast territory tributary to the Canadian Pacific Railway. The camp is a model of one to be erected by the Canadian Camp-Fire Club this summer on the Missesaga River. Mr. Armstrong has an able corps of guides, chief of whom is George Lavigne. George Linklater is an experienced Hudson Bay guide, famous as a mighty moose hunter. In the pack horse competition, Joe and William Brewster will be put to the fore by Mr. Armstrong.

### Abercrombie & Fitch.

The exhibit of Messrs. Abercrombie & Fitch, 314-316 Broadway, New York, is on the north gallery. It is an exposition in itself, so ample, excellent, and diversified is the material which it contains. There are fishing rods from plain to the finest workmanship with reels and tackle to match, all ranging in sizes to suit the tastes of him who seeks the cunning trout or gives battle to the mighty tarpon. There are cameras and rifles. There are traps in size for the tiniest animal up to the largest bear. There are canoes for travel into the wilderness or for use at home; tents and cooking utensils, and camp furniture in bewildering profusion; snowshoes, and all kinds of footwear for the explorer and hunter and tourist, and clothing impervious to water and cold, and tents of all kinds, all set forth so pleasingly that one is quite tempted to try outdoor life if one never tried it before. Practical illustration is shown of packs and packing, the most conspicuous of this feature being a display pack mule laden with his packs in true Western style, his burden securely held by the famous diamond hitch. In another part of the large exhibit is a dog harnessed to a sledge after the manner of travel in the Arctic regions. Then there is an illustration of a camp-fire in full blast with all the camp utensils in place, so numerous when apart, yet taking no more space than that of a small satchel when packed. This great firm supplied the entire equipment of the Ziegler polar expedition during the first year, and Dr. Cook's expedition to Mt. McKinley; the expedition across the Andes and down the Amazon; Miss Anna Peck's expedition to Mt. Serato; the two American expeditions to Abyssinia, and Leonidas Hubbard's expedition to Labrador.

### Grand Trunk Railway.

The attractive display of the Grand Trunk Railway System is in charge of Mr. R. McC. Smith, Southern Passenger Agent, Detroit, Mich. Sturdy specimens of brook trout, black bass, ouananiche, landlocked salmon, and big game heads, etc., testify to the wealth of sport within the scope of the system, of which Mr. Smith is an encyclopædia of information.

### Siegel Cooper Co.

Siegel Cooper Co. have an exhibit on the north gallery, the greater part of which is devoted to watches, but there are many beautiful works of art in silver quite suitable for trophies.

### The Dinner.

The Sportsmen's Exhibition Company entertained members of the press, exhibitors, preserve owners, prominent sportsmen and officers of the Guides' Association at dinner in the Garden café on last Sunday afternoon. Mr. Samuel Walter Taylor presided as toastmaster. Over 200 guests were invited, and by far the greater part of them responded in person. At the speaker's table were Hon. Timothy Woodruff, Messrs. Robert J. Morris, John G. Armory, Ernest Gulich, Buffalo Jones, Warden of Yellowstone Park; Homer Hodge, Dr. McClelland, Wm. T. Hornaday, and others. The talks covered all phases of outdoor sport intelligently and entertainingly. The dinner was a success in every particular.

### Game on Forest Reserves.

REDLANDS, Cal., Feb. 12.—*Editor Forest and Stream:* I inclose an account of a court decision that promises to affect vast areas of good game country throughout this State, if not elsewhere. There is one point worthy of consideration, however, and that is that game, especially deer, would have to be consumed on these reserves, as the State law strictly forbids the "having in possession" deer or deer meat out of season, whether killed in California or imported from another State or a foreign country. At any rate it is to be hoped that this matter may be speedily adjusted with a view of fully protecting the game and fish.

L. D. W.

The report reads: "Much concern is being manifested in Santa Barbara and other sections of southern California over the decision just handed down by Judge De Haven, of the United States District Court, Northern District of California, affecting the jurisdiction of the State over Government reservations for the protection of wild game and fish. Should the decision stand as final, a large part of the best wild game and fishing territory in Santa Barbara county and other parts of the State will be without protection against invasion of pot-hunters, who may kill deer, quail, and all varieties of game without interruption at all times of the year, save for regulations that may be established by superintendents of forest reservations."

"In Santa Barbara county there are two large forest reserves—the Santa Ynez and Pine Mountain—and they are filled with wild game. As the United States Government has no laws regulating the taking of game and fish on reservations, it is clear under the accepted interpretation of Judge DeHaven's decision that nothing can prevent the wholesale destruction of game in Santa Barbara and other counties in the State where the Federal Government has reserved vast areas of land."

"Judge DeHaven's decision was based on a case taken before him from Mendocino county. An Indian, in whose possession fresh deer meat had been found, was convicted in a justice's court. It was proved that the deer had been shot on one of the Government reserves, and United States District Attorney Woodworth took up the case of

the Indian by contending that the State courts had no jurisdiction over Federal reserves, and could not therefore enforce the State game laws. Judge DeHaven has sustained this contention, and the Indian was set at liberty."

### Spring Shooting—An Appeal.

To the Sportsmen of New York State:

In 1903 a law was passed stopping the spring shooting of wildfowl. It was a righteous and proper measure, because spring shooting of any kind is inherently wrong. No game birds should be killed while on the way to the breeding grounds, although selfish men, especially market-hunters, will tell you that it makes no difference in the future numbers of birds. Recall the parallel case of the wild pigeon which became extinct in a few years because man insisted upon killing them while breeding. Is not one lesson enough? Help save our wild ducks and geese, some species of which are becoming dangerously scarce. In the present Legislature a bill (Assembly No. 292) has been introduced by Mr. Hubbs changing the law of 1903 by making the open season end April 1 instead of January 1. It has already passed the House, because there was not a sportsman in this great Commonwealth that sent a protest to the Assembly. If you do not awake and kill the bill in the Senate, a decided retrograde step will be taken in game protection in New York State. Why should a few market-hunters on Long Island have a law passed for their benefit that is directly opposed to the best interests of the citizens of the balance of the State? There are not two sides to this question—it is right vs. wrong, and the wrong is to kill birds that are about to breed. Is civics so dead in New York that a bad bill like this one can be railroaded through a Legislature without a protest from thousands of citizens? I appeal to all lovers of nature to remember the wild pigeons and help save the wildfowl by protesting against the passage of the Hubbs bill or any other bill that permits the killing of game birds in the spring.

WILLIAM DUTCHER,

Chairman National Committee of Audubon Societies.

### Capercaillie in Ontario.

TORONTO, Feb. 17.—*Editor Forest and Stream:* The inclosed copy of letter from the superintendent of Algonquin Park will, I am sure, be of interest to the readers of FOREST AND STREAM. The letter speaks for itself, requiring but few comments from me. You will notice the experiment has been made on a large scale. Let us trust that our most sanguine expectations may be fully realized.

E. TINSLEY.

ALGONQUIN PARK, Cache Lake, Ontario, Nov. 25, 1903. —Dear Sir—I have much pleasure in reporting to you concerning the capercaillie shipped to the Algonquin Park this fall. On the 22d of September we received the first shipment of thirty birds. Of these one had died on the way, and two were so badly hurt that they died on the day they arrived here; the remaining twenty-seven birds were liberated on a large island in Cache Lake in good condition. The next shipment was on the 7th of October. Thirteen birds were in good condition, and were liberated in the same place. The last lot, fourteen birds, came on the 1st of November, and of the fourteen, one died on the way; the rest were in fine condition, and were liberated on the mainland, excepting three hens and one cock, which I kept in a house in the deer yard, making in all fifty-two fine birds. Of the last shipment there was a cock bird smaller than the rest; he was in splendid condition and flew into a tall tree at once, so that I had no opportunity to examine him closely, but I do not think he was a capercaillie. The birds in confinement are doing splendidly, and feed well; they have improved very much since they came, and do not seem any wilder than pheasants. I feel confident they will do well. Of the others, several have been seen and seemed all right, as there is an abundance of feed, and the climate must be very much what they have been accustomed to. I feel sure it will prove a good venture.

I will report to you further should any be seen through the winter, also regarding those in confinement.

(Signed) G. W. BARTLETT.

### The Good Time Coming.

It is very, very, wintry as I look out from my window upon the fast falling snow; but there is a good time coming and we may all be happy again. February is nearly gone and March is, at least, a spring month in name, if not in reality. The days are lengthening fast, and the trout season will soon come round once more. I confess that I am very anxious about the trout in our mountain streams. The winter has been so unusually severe, such quantities of snow have accumulated and the ice is very heavy. If the weather changes suddenly, the break up may be a serious matter. In still water, where it is quite shallow, what is called anchor ice is formed, that is to say, ice that extends to and is fast frozen to the bottom. A big flood with heavy ice may do great damage, particularly if gorges or jams have been formed and the water backed up above them.

We had enough floods and freshets last fall, we think, but then we are not empowered to judge of such matters. As far as I can learn, no great injury was done to the spawning beds of the trout, and the continuous high water, from the first of June onward, was very favorable to the fish. The big trout were quite safe from the poacher who uses the snare, the net and even the rifle when the large streams are reduced to the lowest ebb during periods of drouth. It is astonishing what can be done by a man who is really skillful in the use of the wire snare. If the water is clear and low, the large fish are not safe even in pools of great depth. Trout may be hunted and cheviated about until they actually lose their heads or brains—I believe that they have brains—and will lie close to the bottom, with perhaps only their heads concealed, and allow the snare to slip over them. I would not have believed this possible in the big pools aforesaid, if I had not had proof positive some years ago.

It is only when the temptation is great, I believe, that the net is brought into requisition, but I have been informed, upon good authority, that it has been used for the destruction of large brown trout when all other means have failed. One man told me that he had seen dynamite tried, but that the only result was that all the suckers in the pool were killed, the trout escaping under the rocks. This I doubt. During one of the extremely dry summers, several years since, a farmer on the upper Beaverkill told me that one man had killed many of the trout weighing from three to six or seven pounds with a rifle. That he knew positively, that at least one fish of the latter weight had been shot on his own property. He had known this trout for a long time, and it was about double the size of a fish that he had himself caught with a minnow in another of his pools. All this may be taken for what it is worth, and with as many grains of salt as desired. One thing is certain,

an abundance of water means good fishing unless, indeed, the river is constantly in flood. The trout are protected by a large body of water and do not become so shy. As we grow older we care more for size and quality and less for mere numbers. I think that our sport has been increased decidedly by the introduction of the brown trout (*Salmo fario*), and the rainbow trout (*Salmo irideus*), simply for the reason that we catch much larger fish than we did in the good old days when we were young.

I am referring to old well-known rivers not far away. For some years there was great prejudice against the brown trout, but this has greatly diminished. As for the rainbow, it is a noble fish and game to the death. Of course, our first favorite is our old friend the brook trout.

It is nearly two months before we can wet a line in our favorite stream, but we may think and talk about fish and flies to our hearts' content. The probabilities are that after the unbroken cold weather this winter, spring will come with a rush. Winter may linger with us, but when it takes its departure, there will be no returning to give us a parting kick. (Blow would be better, no doubt.) Soft, warm airs will come from the sunny southland, the birds will hasten to us, birds will burst and leaves appear as if by magic. Swarms of ephemera will arise, and the rings made by feeding trout will be seen on every pool. All nature will be alive and the angler will furbish up his weapons and be away, away, for the scenes that he loves best upon earth. Laugh if you wish, my friend, there is nothing like it or to compare with it in all this world.

I feel sure just now that every thing will be favorable, that the streams will be clear and just high enough for good sport. I know that the trout will run large, and that many big fish will be taken. Now while there is yet time, inspect your tackle carefully. Have all repairs made at once while the shops are not rushed with orders. See that your waders are in good condition and stock up your fly book, if it has been neglected for a time. You can have much pleasure in selecting these carefully, a few at a time. A first-class fishing tackle shop is to me a thing of beauty and a joy forever.

THEODORE GORDON.

"Charley, dear," said young Mrs. Tomkins, "I have done you a great injustice." "In what way?" "I suspected you without reason. I asked several of your friends that you go out with evenings whether you knew how to play poker, and every one of them thought a minute and said you didn't."—Washington Star.

'Tis better to have hooked and lost than never to have hooked at all.

### My First Salmon.

BY EDWARD A. SAMUELS.

BEFORE the Intercolonial Railway was built, anglers from abroad had to face a journey of no mean proportions to reach the magnificent salmon rivers of New Brunswick; for they were obliged to proceed by rail or steamer to Shediac or Point du Chene, from which port another steamer sailed for points all along the north shore, Chatham, near Newcastle, being the nearest point to the great rivers Nepisiquit and Miramichi; the latter noble river with its numerous tributaries, each of which would in itself constitute a stream of no mean proportions, was in the earlier days best known to visiting anglers, principally because it was more accessible by wagon from Newcastle.

More venturesome anglers, however, preferred to visit the Nepisiquit, which was reached after a long and rough drive of some forty-five miles to Bathurst, an unpretentious little town at its mouth.

Those who have in the long ago taken this journey will agree with me that, running as it did through a monotonous stretch of barrens and forest lands which had been swept by fires, it was wearisome in the extreme, for the roadbed was rough, the springs of the wagons unyielding, and the seats and their backs were anything but comfortable.

The condition of things at the present time is of course quite different, for express trains and Pullman sleepers make the journey now a luxurious one, and points to reach which formerly required six to eight days' travel, are now arrived at in thirty-six hours or less from Boston.

I suppose there can be no difference of opinion with me when I state that New Brunswick, with its magnificent river system, is the paradise of anglers. My lines have been cast in "many pleasant places" in this broad continent, but I have never seen elsewhere anything to compare with the salmon rivers of that Province, some of which, with their tributaries, are navigable by canoe hundreds of miles, and contain at short intervals pools which will accommodate two or three rods for several days' fishing. The Restigouche, with its branches, is now the principal water in which large fish are taken, and the Miramichi is a close second to it; and, speaking of the Miramichi, reminds me of what Charles Hallock wrote of it in his "Fishing Tourist," a volume that has given me more pleasure than almost any other book on angling that I have read. He says: "The Miramichi is in length over two hundred and thirty miles from its mouth to North Branch Lake, which is the source of the North Branch, which is a branch of the Southwest Miramichi, which is a branch of the main river. Then there is the little Southwest Miramichi and the south branch of it, and the little south branch of that, the little north branch and the upper north branch. Then there is the Northwest Miramichi, with its east branch, its south branch, and so

on divisibly and indefinitely. If a friend tells you he has fished the Miramichi River, never dare to doubt his word. If he has ever fished that part of New Brunswick, it is doubtful if he has fished anything else."

I have cast the fly in most of these streams many a time, and noble sport I have had; the scenery through which all these rivers pass is picturesque in the extreme, and at many points is almost grand and awe-inspiring; but although they have always had attractions for me, I have for some reason or other, perhaps because I killed my first salmon in its waters, had a preference for the Nepisiquit, and to this day, if I had my choice of an opportunity for salmon fishing, I think I should go to this beautiful river.

The recollection of my first visit to the Nepisiquit is among the pleasantest in my memory. I had received an invitation from one of the provincial officials to join him in a short outing on the river, and in compliance with that invitation I met him at the principal hotel in Bathurst one afternoon in early summer; he had arrived in the town a day or two preceding me, and had canoe-men engaged, stores laid in, and everything was in readiness for a start up the river as soon as I arrived.

My long, rough ride had proved very fatiguing, and I should have been glad to have stopped in the hotel over night, but as my friend seemed anxious to get away at the earliest possible moment, I hastily changed my clothes at the hotel, donning my fishing suit, and with rod case, fly-book, and all the other paraphernalia of an angler's outfit, climbed into a two-seated wagon which was waiting for us at the hotel stoop, and we started off at a brisk rate on the road which led to a landing on the river a few miles above the town.

Our canoes, stores, tents, etc., had been packed on a heavy wagon, and this had preceded us an hour or so, and arrived at the river shore about the time we reached

using the fly on the surface as I had heretofore been accustomed to when fishing for trout. "Sare, you no fish just right," exclaimed my French guide. "Ze fly must sink—so," and he took the rod from my hand and cast the fly deftly way across the pool into a dark eddy, beneath the surface of which it was allowed to sink two or three inches and then was drawn a foot or so towards the angler, which operation was repeated until the rod was almost lifted ready for a back cast.

I saw at once what my guide wished to teach me, and again taking the rod, I cast out into the same bit of water into which he had cast, and I think I proved a creditable pupil, for I had not offered my lure a dozen times before it was accepted, and I was fast to a noble fish.

I dare say that most anglers have a vivid recollection of their first success with a large fish. I remember as perfectly as if the event was yesterday the first large pickerel I ever captured; it was a five-pounder, and I was only about ten years of age; and the recollection of my first heavy trout and bass comes back to me as if the occurrence had been a very recent one.

A strange thrill passed through me as I felt that indescribable tug at my line, and saw my salmon as he jumped clear of the water and rushed at railroad speed toward the upper end of the pool.

I have heard frequent mention made of what is commonly called "buck fever," but I never was afflicted with that malady, the first deer I ever shot having been dropped with as little concern as would be the cutting down of a snipe or a woodcock; but the feeling with which I lifted my rod and prepared to do battle with my gamy antagonist, the tremor that I first experienced was undoubtedly very similar to the fever I have named; but a few words from my guide cautioning me to hold my rod well up and handle the fish with the reel, brought me

pools, such as the Middle Landing, Rough Waters, etc., and finally found a tenting place just below the Grand Falls which is the highest on the river to which the salmon ascend.

Charles Hallock, in describing these falls, says: "The river is here much contracted, and the banks are rocky and perpendicular. The total height of the falls is one hundred and forty feet. There are four separate leaps, but only the two lowest are visible below. At the foot of each are deep basins, and below them for about a mile a number of gloomy pools and rapids which seethe with perpetual foam and chafe with deafening roar. And the constantly rising spray keeps ever fresh with a vivid green the foliage that crowns the impinging cliffs. Birds congregate here in the summer heat, and luxuriate in the coolness of the spray and verdure."

We had good success during our three days' stay at this point, a good half dozen salmon and a few grilse falling to our lines; we might have taken more fish, although the water was not in the very best condition, but we killed all we could use; we had all we wanted, and "enough is as good as a feast," as the old saying is. And when we entered our canoes for the home returning we voted that the outing had been a success in every particular.

At the Rough Waters, as I was casting in a desultory way, I rose and hooked two miniature salmon; they were bright little fellows of from eight to ten inches in length; I recognized them at once as smolt or young salmon, but my friend, on examining them later, pronounced them to be graylings, and declared that they were not only graylings, but identically the same fish that was abundant in Loch Lomond near St. John. I told him that so far as I knew, the true grayling was not to be found in any New Brunswick waters. He was firm in his opinion, however, notwithstanding all my efforts to explain how and why the fish before us were young salmon.

Since that time I have been able to prove very conclusively that the grayling known to the anglers of the lower Provinces is not a grayling, but is either a young sea-salmon or a small landlocked salmon.

A few years ago, as I was in Scribner's tackle store in St. John, I had an opportunity for examining a creel of the fish that they there called the grayling, but which were really small "landlocks." A few days later I visited Loch Lomond and took a few of the so-called grayling, and they were, like the others, small "landlocked." In the pamphlet published by the Intercolonial Railway describing the fishing and hunting regions of the Provinces, mention is made of the occurrence of the grayling near Truro, N. S., as follows:

"In the Salmon River fish known as grayling are caught in large quantities. Some allege that this fish is a trout, and others that it is a young salmon. Whatever it may be, it is a lively fish under the rod. It ranges from two to six pounds in weight."

Since this pamphlet was published, I have visited the river above named, and have taken a number of the fish; of course, they were not grayling, but were very respectable sized and lively grilse, though I did not get one anywhere near six pounds in weight. Provincial anglers also have had a good deal to say about the splendid grayling fishing in Folly Lake, a few miles from Truro. I have also visited that lake, and taken some of those graylings, but they proved to be my old darlings, the landlocked salmon.

### Very Heavy Roe Shad from Georgia.

WASHINGTON, D. C., Feb. 16.—Shad of unheard of size are arriving from Georgia (so the market men state). One fish dealer received a consignment of 700, of which fully one-half were roe shad weighing 12 to 15 pounds each. Single specimens as heavy as 14 pounds have been in infrequent record hitherto, and Georgia fish not largely in evidence compared with half a dozen other States. Has the cold weather north of Cape Hatteras kept them back to fatten and enlarge? One old shad fisherman of fifty years' experience on the Potomac says that if the river could remain ice-locked until the middle of March, "shad will be so plenty that boys can snag them out with hook and line." I hope the fish commissioners will investigate.

## The Kennel.

### Russian Wolfhound Club.

NEW YORK, Feb. 16.—The Russian Wolfhound Club of America was formally organized on Wednesday, February 10. Constitution and standard were adopted, and officers elected as follows: President, Edward L. Kraus; Vice-President, John G. Kent; Secretary-Treasurer, Joseph B. Thomas, Jr. Executive Committee—James Mortimer, Dr. J. E. De Mund, E. M. Lockwood, George Ronsse, Jos. B. Thomas, Jr. Dr. J. E. De Mund was elected delegate to A. K. C.

The club organized with fifty charter members. Dues were fixed at \$5 per annum, with an initiation fee of \$5. Special prizes will be offered at the various shows, and every effort made to advance the interests of the Russian wolfhound.

(Signed) JOSEPH B. THOMAS, JR.,  
Secretary-Treasurer.

### Death of Glen Monarch.

A COMMUNICATION, under date of Feb. 17, from Dreamwold, the farm of Mr. Thos. W. Lawson, Scituate, Mass., recounts a great loss as follows:

Our American champion bulldog, Glen Monarch, was shipped from the New York Show on Sunday in perfect condition, but, on the arrival of the train at Dreamwold, he was found dead in his box. Glen Monarch was bred by Mr. W. C. Codman, of Providence, R. I., from whom we purchased him for \$2,500. He was the most famous American-bred English bulldog of the day.

### The Game Laws in Brief.

is the standard authority of fish and game laws of the United States and Canada. It tells everything and gives it correctly. See in advertising pages list of some of the dealers who handle the Brief.

GRAND FALLS AND FALLS POOL ON NEPISQUIT RIVER, N. B.  
From "With Fly-Rod and Camera."

it. Our canoe-men were four in number, two of them being French-Canadians, the third a Scotchman, and the fourth a genuine New Brunswicker; they were all small-sized men, neither of them exceeding five feet four inches in height, but they were adepts in the use of the paddle and setting pole.

The two French guides with their canoe were allotted to me, and the others, of course, were at the service of my friend. The canoes were launched and packed as quickly as possible, and we started off at once for our first tenting place, which was to be at the famous Pabineau Falls. This was reached an hour or so before sunset, and before darkness had set in our tent had been raised, beds prepared, and supper had been cooked and eaten.

My first night was, as is usual with me, a wakeful one, for I do not quickly become accustomed to the sounds of the woods. The water churning and rushing over the rocks of the falls, however, sang an ever-to-be-remembered lullaby, and to its music I finally fell asleep.

We were astir bright and early on the following morning, and while two of the guides prepared our breakfast, my friend and I, accompanied by the other two canoe-men, made our way out on the rocks near the pool below the falls and began casting. This pool has been, and is now, so far as I know, one of the most famous salmon pools in the Dominion. I have seen in its sparkling waters, I venture to say, two or three hundred good sized salmon at one time; they formed an almost compact mass, rising and falling simultaneously, and moving in various ways, as if actuated by a single impulse.

My rod on that occasion was a heavy greenheart; it was spliced at its joints, and was a serviceable tool, except that it had a kick in it which was very trying to my back, and which on one or two occasions had nearly thrown me out of my canoe as I was casting from it, standing.

My friend took a position well up toward the head of the pool, while I chose a point near the tail or foot of it. Directed by my guide I dropped my fly here and there at points which he considered most likely to obtain a rise, but I failed to meet a response to my efforts. Be it remembered I had never before fished for salmon, and was

to my senses, and I was soon playing the salmon with all the steadiness of nerve that a veteran angler could possess.

The fish put up a magnificent fight which tested my tackle to the utmost; fortunately I had a long line, about a hundred and twenty-five yards being packed on my large old-fashioned click reel, for the fish seemed to be determined to be all over the pool at once, and in his turns and runs the line was often taken out twenty or thirty yards at a time.

The fish wore the silvery coat of a fresh run salmon from the ocean, and the strength and activity he displayed I shall never forget.

Now and then he dove to the bottom of the pool, where, in moving about, he drew the line sharply across the bellies of other denizens of the water, causing them to leap high in the air in their fright. On one occasion there were three or four of these leaping salmon in addition to my own, and it was a puzzle to determine which of them was the fish to which I was fast.

The struggle had lasted nearly a quarter of an hour before the salmon showed signs of exhaustion, but when he began to yield he yielded gracefully, and after a few more struggles, which grew more and more feeble, he permitted himself to be drawn close to the rock on which my guide was awaiting him, gaff in hand, and a vigorous thrust brought the exhausted fish safely up on the ledge where I was standing; a couple of smart raps on the head quieted him, and I then was enabled to inspect the prize that I had succeeded in winning; it was a fish of goodly proportions and symmetrical form, and it registered with the scales a good 15 pounds.

At this juncture I was joined by my friend, whose guide was carrying a salmon that had fallen to his rod, which was of about the same size as the one I had killed.

"It's a handsome pair," exclaimed my friend, "and both just up from the sea; it's a mighty good showing to make before breakfast and the sun hardly up."

We remained at Pabineau Falls a couple of days, meeting with satisfactory success, considering the character of the water, which was rather low and clear; we then packed our tent and other dunnage in the canoes and cruised up and down the river, fishing several of the

## Cruise of the Yawl Nerine.

The Story of a Cruise from New Rochelle, N. Y., to Marblehead, Mass., and Return.

BY SANDFORD G. ETHERINGTON, NEW YORK CITY.

"HOME again."

As I look back to the day when these two words were recorded in our little log, I can feel almost the same vague sadness that seemed to hang in the air then "Home again." No more tumbling out before sunrise, and creeping out of the harbor in the gray of the morning; no more heeling in the fresh breeze and tearing through the water with everything drawing and lee rails awash; no more last pipes, with the gentle motion and soft lap-lap of the water to lull us to sleep the next moment. Our sailing days were over.

The cruise, lasting seven weeks and one day, was made in the yawl Nerine, hailing from New Rochelle. Nerine is 43 ft. over all; 30 ft. waterline; 9½ ft. breadth; and 8 ft. draft; flush deck; designed by the late Edward Burgess, and built by Lawley in 1891. She was formerly a cutter, being changed in 1902 to a yawl, the latter, with a short bowsprit, proving far safer and more comfortable. As a small cruiser, Nerine is practically ideal, 14,000 pounds of lead on her keel enabling her to stand up under full sail (1,196 sq. ft.) in a fresh breeze. On deck is a steersman's cockpit, forward of this a skylight over the after cabin, and forward of this a combination skylight and companionway leading to the main cabin. Just aft of the mainmast is a manhole leading to the fo'c'sle. A scuttle in the cockpit opens into a large lazarette, used for the stowing of awning, sail covers, ropes, etc.

Below, Nerine is remarkably roomy for a craft of her size. She has 6 ft. head room, a main cabin 9 ft. long, an after cabin 6 ft. long, and a large fo'c'sle. In the main cabin are two transoms and two hanging berths, the latter covered in the day time by curtains. In the after cabin are two bunks, a large mirror, marble wash basin, etc., clothes, linen, and chart lockers. The whole boat is wonderfully compact, every inch of space being utilized for some sort of locker. In the fo'c'sle is a pipe berth for the hand, a two-burner Khotal stove, ice chest, dish and food lockers.

Three of us were aboard during the cruise; "Shave" Vanderbilt, Rudolph, the paid hand, and the writer. We went down to New Rochelle on June 24, and put in a good week's work on the boat, July 1 finding her in splendid shape for the trip. "Jo" Johnston, who was to sail to New Haven with us, came aboard on that date and expressed much surprise at the results of our painting and polishing. "Wouldn't know her," was his comment. We turned in early, and Shave's snoring was soon the only sound to break the silence.

Rudolph was up with the sun, and the splash of

headed in toward the breakwater at New Haven, dropping anchor at the regular yacht anchorage in Morris Cove at four o'clock. The run of fifty-two miles had taken us just seven hours.

After breakfast the next morning quite a spirited discussion arose concerning the relative merits of New London and Shelter Island as headquarters for the Fourth. Shelter Island was finally decided upon, and I stepped the mast in the tender to set Joe ashore, and to buy bread, milk, and other provisions. Shave and Rudolph stayed aboard to hoist sail and lay out the course for Plum Island Light. When the tender had been dropped astern again, we broke out anchor and headed for the end of the eastern breakwater. The wind was still holding west and blowing at about seven knots. A cutter, perhaps 60 ft. over all, was standing out of the harbor a little distance ahead of us, and we were much pleased, as well as surprised, to see Nerine pull up rapidly, and finally pass her some ten miles out. The course for Plum Island was E. by S. ½ S., and with the mizzen winged again it was clear sailing, although the boat yawed considerably in the short swell, making the steersman keep his eyes open.

We passed Faulkner's Island at 11 and sighted Corn-

On Board the Yawl Nerine—The Owner, Guests and Crew.

field Lightship about 1, soon afterward making out the light in the middle of Plum Gut. The course was changed a bit so as to leave the light to starboard, and we were rapidly nearing it, when, "Keep her off, keep her off," came from Shave, who was standing forward. It looked as if we were on top of a sand bar, breakers dead ahead. Rudolph dove below for the chart, and seeing that it gave 13 fathoms, we put her on her course again, the breakers proving to be a tide rip. Farther on, abreast of the light, breakers 5 and 6 ft. high were encountered, nothing coming of them, however, but a little water on deck. Once past the light we looked back and saw a line of surf stretching from Oyster Pond Point to Plum Island, the whole distance looking like a huge sand bar.

The wind was dead ahead for Shelter Island, so we trimmed everything flat and stood off on a long hitch to port. Rudolph, after a look at the chart, informed us that we were due to see a light marking the channel to Shelter Island, and that the bay contained no dangers, so Shave and I didn't bother to go below. After half an hour's sailing we sighted a light. "How do we leave the light, Rudolph?" I sang out. "To starboard." Seeing a red channel buoy to port I swung her around, and with boom to port, headed for the entrance, which was perhaps two miles away. As we neared the light, Shave took the tiller and I went forward to have a look at things. "Looks kind of funny, Rudolph. Seems to me the deep water's on the other side." "It can't be. Take a look at the chart yourself, sir." Sure enough, channel to port. Remembering our experience with the tide rips, we kept on, eating through the water at a great pace. Suddenly we brought up hard on the bottom, not 100 yards from the lighthouse. We looked at each other in amazement. "Chart must be wrong, confound the luck. It gives plenty of water—always knew those charts were no good," said Shave. "Never mind the charts, get that anchor out over the stern. Flood tide isn't for half an hour yet." Rudolph jumped into the tender and dropped the anchor 50 yards astern. "Now get busy on that capstan." We slowly pulled the anchor back to the boat, put it out again, but in vain. The boat didn't budge an inch. We were hard and fast aground.

We sat around on deck awhile, indulging in some miscellaneous profanity, which relieved us a great deal, and then rowed over to the light to ask the keeper what kind of a new channel was in use. We found that we were at Cedar Island, some four and a half miles out of our course, and that the channel was on the other side of the light. All hands were somewhat relieved to find that our mistake had been made before, a large schooner having run aground there the preceding summer. But it was a mistake all right, and a

big one. Long Beach Light at Shelter Island is a white structure, and Cedar Island is built of dark granite. If we had noticed these descriptions on the chart we would have found that we were away off our course, and acted accordingly. Our experience at Cedar Island was not without its good results—it taught us to look over every bit of advice and description on our charts, and in our Mariner's Guide. This is a thing that, as we found, cannot be done too carefully. And always have at least two study the charts; the chance of mistake is much less than when all is trusted to one man.

We most certainly were in a beautiful situation; Sag Harbor, the nearest port, some three miles to the southwest; no tugs thereabouts; and the next day the Fourth. After some ironical consolation from the keeper, we put back to the Nerine, where Shave and I cleared the anchor while Rudolph cooked the supper. After eating, we placed an anchor some 50 yards to each side and bent on the halliards to the cables, setting the former tight with an idea of keeping on an even keel when the tide fell.

By this time we were ready to drop asleep in our tracks, so, taking down the table and piling the dirty dishes on the transoms, we turned in. Along about midnight the wind dropped, and, as we were close to shore, the cabin soon filled with mosquitoes. After beating around awhile I noticed that the deck seemed fairly clear of them, so took the blankets up on deck and soon fell asleep. Suddenly there was a lurch and a tremendous banging and crashing, and waking with a start, I found myself in the water with the blankets on top. Loud yells were issuing from the cabin. The water was up only to my waist, so I crawled up the deck and found that the port anchor had lifted out of the mud and let the boat down with a crash. The yells came from Shave, who had been sleeping in the port bunk, and had been thrown clear across the cabin on to the floor, where I found him lying with pillows and broken dishes on all sides. The lockers had been left unfastened, and almost every dish we had was broken in the general smash. After a lot of talking we cleared things up and turned in again, this time to sleep until 5.

Finding the boat on an even keel again, we turned out and worked for about an hour with the capstan and anchors. Seeing that this was useless, Shave and I hoisted sail in the tender and started to sail to Sag Harbor to dicker for a tow. After running aground four times, we finally made the steamboat wharf and tied up. We spent the entire morning in Sag Harbor, but as everyone seemed to be celebrating the Fourth by patronizing the saloons, there was hardly a sober person in the town. Consequently, nothing was doing in the towing line.

We sailed back again, and after an uneventful day and night went ashore again Sunday morning. After much

The Yawl Nerine at Anchor.

water on deck brought us tumbling out for a quick dive and rub-down. While breakfast was cooking we ran up jigger and main, coiled halliards, and cleared things generally. After a hearty meal of oatmeal, ham and eggs, and coffee, Rudolph started to clean up below, while Jo took the gasket off the jib and stood by to cast off. "All clear," he shouted, and hoisting the jib we reached out past the buoy in a fine westerly breeze and took our course W. ¾ N. for Stratford Shoal.

It was a magnificent day, clear and cool, with a spanking breeze. We winged the jigger and tore along at a good eight knots. Larchmont was passed with the usual array of yachts anchored outside, the white hulls against the dark background making a beautiful picture. The Norwalk Islands hove in sight toward noon, and after an uneventful run we sighted Stratford Shoal, and

The Yawl Nerine Under Sail.

persuasion, we induced the captain of the tug Surprise, which had come into the harbor the night before, to get up steam and go out to the island with us. On the trip out we stood with him in the pilot house, wondering at the skill with which he guided his boat through the narrow, twisting, and badly buoyed channel. Let me pause right here to remark that no stranger should attempt to enter Sag Harbor without a pilot. There is a good anchorage about a mile to the south of Cedar Island, on the left of the channel where the buoys show it to be the broadest. This anchorage is easy of access, deep, well sheltered, and in fact, much better than the inner harbor.

The Surprise soon pulled us into deep water, and after a few drinks from our bottle of Wilson, and various interchanges of greenbacks, the captain waved good-by and good luck to us as he disappeared be-

hind the lighthouse on his way back to Sag Harbor. We hoisted sail and took our course N. E.  $\frac{1}{2}$  N. across Gardiner Bay for New London. Running wing and wing, as usual, we soon sighted the white tower of the light, passed it, and dropped anchor off the New York, New Haven & Hartford station just as the clock struck six bells.

The regular yacht anchorage at New London is off the Pequot House; the railroad station is about two miles further up the harbor.

The next day was Monday, the sixth. After a 9 o'clock breakfast, we sent Rudolph ashore to lay in a stock of everything. He did, returning with the dinghy loaded to the gunwale, and a receipted bill for \$41.80. As soon as the stuff had been stowed in the lockers we ran up the sails, and in a light southerly breeze started to beat out to Race Rock. Once outside the harbor we found everything hidden by a thick haze, which, however, lifted a little after we had made a long board to starboard. Coming about, we found that we could just fetch the Rock.

Leaving Race Rock some two or three hundred yards to the starboard, we kept off a bit, and reaching along past the hotels and cottages on Fisher's Island, soon lost the light in the haze.

Keeping a mile or so off shore, we slipped along, until, about 4 o'clock Watch Hill hove in sight. Seeing breakers to port, we kept a sharp lookout, and, with frequent references to the chart, crawled along past the bell-buoy and dropped the hook off the bathing beach. The sun went down just as we anchored, and we thanked our lucky stars that the ledges between Fisher's Island and Watch Hill had been passed by daylight.

There is an anchorage at Watch Hill away around behind Sandy Point, but the channel is hard to find. The best place, in ordinary weather, is about a quarter of a mile directly off the bathing beach.

At supper, the coffee pot kept sliding from one side of the table to the other as the boat rolled in the swell, finally sliding off into Shave's lap, spoiling a brand new pair of white flannel trousers and causing that gentleman to use much hard language as he arrayed himself again for the trip ashore. The people we wanted to call on were out, and the town being deadier than it was on the water, we put back to the Nerine and spent the evening reading.

The next morning we laid out a course E.  $\frac{1}{8}$  S., from Gangway Rock, off Watch Hill, to the whistler off Point Judith. Keeping about three miles off shore, we reached over in a fresh southerly breeze, rounded the buoy, and winged the mizzen for the run up to Newport. Owing to a haze we had quite a bit of trouble in distinguishing between Whale Rock and Beavertail Lights, but remembering our experience at Sag Harbor, we paid close attention to the chart and finally located Beavertail as the one dead ahead. On the run up from Point Judith we passed a long string of barges that had been just distinguished ahead of us when we left Watch Hill.

There is plenty of water all along through here, and no attention need be paid to the charts, except as a means of locating the lights.

The straw colored sides of Brenton Reef Lightship now loomed up through the mist off to starboard, and, giving it a berth of about a mile, we soon passed Castle Hill and the Dumplings and rounded Point Adams. Keeping an eye out for two buoys off the end of the torpedo station, we wound our way in through the hundred and one vessels in the harbor and rounded up off the New York Y. C. station. This seemed to us the best anchorage. We lowered sails, put the covers on, and set the awning for first time since leaving New Rochelle.

About midnight Shave and I rowed ashore to meet Jack Munn, who was to arrive on the Fall River boat, due at 2:30 A. M. After a long wait, spent in fighting mosquitoes, the boat came in. Jack was the first man off, and all hands put back to the Nerine and turned in.

After breakfast next morning, all four of us went ashore to look the town over, and at the first corner we turned ran into Potter, a club mate at Princeton. Pot. insisted on our sailing over to Jamestown and anchoring off the Conanicut Y. C., so taking him with us, we went back to the boat, hoisted jib and jigger, and started to beat over to Jamestown in a heavy west wind, full of wicked puffs. Even under our shortened sail we had all we wanted, and had to luff her several times. There is good water at Jamestown, and we dropped the hook in 3 fathoms some 200 yards from shore, directly off the Conanicut club house. Then all hands went ashore for dinner at Pot's.

We laid at anchor off Jamestown from Wednesday, July 8, until Sunday, July 12. Jack received word on Saturday which made it necessary for him to give up the trip, so we persuaded Pot to come along with us. After bidding farewell to our friends at Jamestown, we weighed anchor early Sunday morning, and started to beat out of the harbor in a fine southeasterly breeze. We made the course from Brenton Reef to Vineyard Sound Lightship E. by S.  $\frac{3}{4}$  S., and leaving Brenton Reef Lightship about half a mile to starboard—to give it more of a berth would mean trouble with Brenton Reef—we could just hold our course on a close reach.

It was a perfect day, with no swell to speak of, and with lee rail awash, we tore along at a tremendous clip. We kept about five miles off shore, and just before lunch Cuttyhunk appeared to port, and we soon made out Vineyard Sound Lightship dead ahead. Gayhead loomed up to starboard, the red tower of the light looking about a mile high. We rounded the lightship and started sheets for the run up Vineyard Sound. Several long tows passed us, making fine time to the westward, while at times we seemed to be standing still. A glance at the tide tables explained this—the tide had turned. Besides this, the wind had dropped a bit. The tide runs about three miles an hour through the Sound, and to make any sort of headway one must have a good breeze on the quarter.

We slowly crept past Gayhead, then Quick's Hole and Tarpaulin Cove. The wind dropped a bit and we stayed off the latter for almost two hours, only leaving it when the breeze freshened again. Keeping well off shore to avoid the big bar on the Vineyard side of the

Sound, we reached along past West and East Chop, and rounded the latter for the beat up into Edgartown Harbor. The sun was just going down as we made out the Squash Meadow buoys to port.

Owing to the long sand bar, persons attempting to beat up Edgartown Harbor in the dark should take tacks of not more than ten minutes each, and should keep at least one man in the bow to watch for buoys. There is plenty of water in the channel.

With Shave and I up in the bow, and Pot at the tiller, we kept on, Rudolph keeping the lead going. On one port tack we passed within 3 ft. of a huge spar buoy. Coming about we passed close to another spar and thought that we were in a pretty mess, until Pot discovered that we had come about in thirteen points instead of eight, and that we must have passed the same spar twice. Edgartown and Cape Poge lights helped us, and after a long beat we dropped anchor, as we thought, some quarter of a mile from Edgartown Light, and almost on top of shore.

The next morning we were much surprised to find that the light was a good mile away, and the other shore about half a mile. After breakfast we ran in the anchor, hoisted the jib, and finally dropped the hook just outside of a lot of catboats, some hundred yards from shore.

[TO BE CONTINUED.]

## The South Bay Scooter.

### How to Build One.

BY H. V. WATKINS.

For the past ten years the baymen and residents along the south shore of Long Island, particularly those down at the eastern end of the Great South Bay near Bellport, Brookhaven, and Smith's Point, have had a "cinch" on a sport that has just begun to awaken widespread interest. The craft used is called a scooter, the sport "scootering."

Nowhere else in the world will be found a craft in design, method of handling, speed, capability, and safety, like the South Bay scooter. The boat was primarily designed for winter use, but many make an all the year round gunning and rowboat of it, as in smooth water its rowing and sailing qualities are all that could be expected in any sailing boat of the same size.

While ice yachting at a mile-a-minute clip will never cease to be exhilarating, there is always present an element of danger from cracks and air holes which, to a certain degree, lessens the pleasure of the sport.

In a scooter one is entirely free from fear of these dangers to the ice yacht; in fact, you pass over them at full speed with hardly any perceptible difference in the sailing, except a slight jolt or two, according to the size of the crack or air hole passed over.

The sensation of absolute safety in a scooter is indescribable to a novice; it must be experienced to be appreciated.

While of peculiar design, the scooter is not a difficult craft to construct. From diagrams and instruction given herein any amateur builder can easily put one together. The materials needed will be as follows for a plain, substantial scooter:

125 sq. ft.  $\frac{1}{2}$  in. clear pine for deck and bottom; 20 sq. ft.  $1\frac{1}{4}$  in. boat cedar for deck and bottom frames; 12 sq. ft.  $1\frac{1}{4}$  in. oak for runner woods, mast step, etc.; 2 pieces  $\frac{3}{4}$  in. by  $\frac{3}{4}$  in. by 16 ft. planed oak for outside strips; 1 piece  $\frac{1}{2}$  in. by  $\frac{1}{2}$  in. by 16 ft. planed oak for coaming; 2 pieces  $\frac{1}{2}$  in. by  $\frac{1}{2}$  in. by 15 ft. clear pine for side pieces; 10 gross 1 in. No. 8 brass flat head screws; 1 gross  $1\frac{1}{2}$  in. No. 10 brass flat head screws; 1 gross  $1\frac{1}{2}$  in. No. 10 brass flat head screws; 1 dozen  $\frac{1}{4}$  in. by  $\frac{3}{4}$  in. galvanized or brass carriage bolts; 20  $\frac{1}{4}$  in. by 1 in. by 10 ft. spring brass or steel runner shoes; 10 pounds white lead; 1 quart each of oil and turpentine; 3 pounds of putty; 2 balls candle wick; small piece 3 in. oak for stem; 1 4 in. galvanized cleat for halliards; 2 deck plates with staple; 2 shroud plates with staple; 1 pair galvanized or brass rowlocks and sockets; 3 galvanized  $\frac{3}{4}$  in. single pulleys for main sheet; 1 galvanized  $\frac{1}{2}$  in. single pulley for jib halliard; 1 pair 6 ft. spruce oars; 15 fathoms  $\frac{3}{4}$  in. diameter manilla rigging for main sheet, halliards, shrouds, etc.;  $\frac{1}{2}$  pound small cotton rigging for bending sails, etc.; mast, boom, gaff, jibboom, bowsprit, and pike poles as shown in diagram B.

First get out stem of oak 3 in. thick, as diagram shows, with grain of wood running horizontal, then joint (plane) 1 in. by 3 in. side pieces straight on one edge, tapering other edge as shown in diagram. Mark the straight edge, top. Now snap a chalk line on the floor 15 ft. long far enough away from the side of the building to give room to work around the boat, as this mark will be the working center. Nail side pieces to the stem and lay them down with the straight or top side down, keeping the point of the stem exactly on the center mark. Now get any strip about 1 in. by 2 in. and cut off exactly 3 ft. 9 in. long. Make center mark and lay at right angles across chalk line 7 ft. from the stem. Draw in the side pieces until the ends are about 14 in. apart and fasten so that they will remain in place while the stern is being fitted. Make this out of  $1\frac{1}{4}$  in. oak and fit at an angle of 45 degrees, leaving width sufficient to receive a slight crown in deck and bottom, and nail sides firmly to it.

You now have the outside lines and are ready to put in bottom frames. First get the exact width near the temporary crosspiece, and on one of the  $1\frac{1}{4}$  in. cedar boards,  $\frac{3}{4}$  in. from the top edge, make a straight line from point to point of width indicated. Now,  $\frac{3}{2}$  in. above this line, and for 9 in. each way from the center, make a parallel line, from the ends of which mark an easy curve down to the frame end marks. This will give the swell of the bottom at its widest point, the flat center being made to prevent dragging on the ice between the runners.

Saw out frame  $1\frac{1}{2}$  in. in depth. This done, using frame for a pattern, mark out on  $\frac{1}{2}$  in. pine a duplicate, but only one-half the length of whole frame, which will give you a pattern for the other bottom frames fore and aft until the narrowness of the boat cuts out all the flat part. Cut the first frame snugly between side pieces, dropping ends flush with edge, keeping square with working center line. Put one  $1\frac{1}{2}$  in. brass screw through side piece into each end of frame to hold in place. Now space off the

rest of the frames 10 in. from center to center each way. Get the length of each and mark them out on the  $1\frac{1}{4}$  in. cedar plank, bearing in mind to keep straight part of pattern up  $\frac{3}{2}$  in. as in first frame. Keep curved end of the pattern to outside mark each time. When the frames have shortened sufficiently to overlap the straight part of pattern at center mark, you will have cut in 7 or 8 frames. Now take a light batten strip as long as your boat and lay along the frames over center mark from stern to bow; press down at ends and trim the oak stem to the level as indicated by the strip. Trim the stem or transom also, giving it about 1 in. crown in center.

Now, fasten batten down at each end, and it will then indicate the sweep on which to get out all remaining timbers fore and aft. When these are in, take another batten and slide over the frames to get proper bevels for trimming side pieces. The boat is then ready to be planked. Rip up and plane straight the  $\frac{1}{2}$  in. pine into strips  $\frac{3}{2}$  in. wide; lay the center strip first, fasten with 1 in. brass screws (two in each frame), and not more than 2 in. apart along the ends at edge of the boat. Set each plank up snugly before fastening, and when all are on, caulk each seam with the candle wick, and prime with white lead paint.

At this stage the boat can be raised from the floor and placed on saw horses or boxes for convenience in doing the rest of the work. The runner woods can now be put on.

Snap a line along the center of the middle bottom plank 10 ft. long, beginning 2 ft. 6 in. from the stem (bow); ten inches from this line on each side make a parallel line of the same length. These two lines mark the inner edge of each runner wood. Now take the  $1\frac{1}{2}$  in. oak plank, and, placing it on edge, exactly following the runner line, brace it so it cannot move, then scribe it down the whole length of the runner mark so that it fits perfectly on each side. Sixteen inches from each end make a "spot mark" (on inside), keeping bow mark  $1\frac{3}{4}$  in. up from bottom edge and aft mark up  $1\frac{1}{2}$  in. From these two dots sweep an easy turn with  $\frac{1}{2}$  in. raise in center by using light batten. Taper the ends from these marks down to extreme ends of runner wood with a gradual turn. Rip along this line carefully, tipping the saw so that when wood is in place on the boat it will bevel away from the center of boat about  $\frac{3}{8}$  of an inch on the width of oak. The wooden runner is now dressed excepting that the edge on which the steel shoe is to be placed is too wide. Take the surplus wood from the outside, leaving base full width for strength. Fasten in place with the 3 in. brass screws and  $\frac{1}{4}$  in. by  $\frac{3}{4}$  in. bolts, alternating with each timber. Be very careful to keep inside edge of wood to the mark, and get the two runners exactly parallel, for on this point depends the success of all scooters. In drilling the metal shoes have the screws about 6 in. apart, avoiding each large screw and bolt in runner wood by at least 2 in. Use  $1\frac{1}{2}$  in. No. 12 screws for the shoes. Brass screws for brass runners; steel screws for steel runners.

Turn the boat over now and frame deck. Put the first frame across about 4 ft. 6 in. from point of bow, or directly over bottom frame that comes nearest to that distance. Give this a crown sufficient to make the boat 10 in. deep from inside of bottom planking to top of the deck frame. Keep ends down flush with side piece, as was done with bottom frames, and put  $1\frac{1}{2}$  in. screw in each end also.

The next frame should be put in 6 ft. aft of this one, and have crown sufficient to give a depth of 9  $\frac{1}{2}$  in. from the bottom. To get the proper crown for the frames to fill out each end, spring the small batten, as was done on the bottom frame, the length of the boat.

The 6 ft. space is left for the cockpit or hatchway, but must have deck timbers along each side. The hatchway may be cut round at ends, pointed or square, as per diagram. The latter is easiest.

To get the sweep of these short timbers, a section of the first deck timber may be used as a pattern. In cutting to fit against side pieces hold up inside end to conform with sweep of the timbers already in place. For strength to support the deck, screw  $\frac{1}{2}$  in. by 4 in. pieces pine on the sides of these and the bottom frames close out against the side pieces. When all the deck timbers are in place, trim off the outside strip to proper bevels, as was done with bottom edge, and proceed to lay the deck. For rowlock socket pieces there are several devices, but the strongest is to fit a piece of 3 in. by 3 in. pine upright 16 in. forward of the back end of cockpit, and right against outside piece before you lay all the deck. These may be tapered to symmetrical proportions at any time after they are in place, first sawing ends down to a level line of coaming.

For coaming use  $\frac{1}{2}$  in. by  $\frac{1}{2}$  in. by 16 ft. oak. Keep this level all around on top, letting lowest points be 2 in. from center of deck forward and  $1\frac{1}{2}$  in. from center of deck aft. Caulk the deck seams as was done with bottom. Now plane the edges of deck and bottom off flush with the side piece. Paint well with thick paint, and, while the paint is fresh, screw the  $\frac{3}{4}$  in. by  $\frac{3}{4}$  in. by 16 ft. oak along the entire length of the boat; when fast, trim top and bottom edges down flush with deck and bottom. A small rail about  $\frac{1}{2}$  in. by  $\frac{1}{2}$  in. with frequent scupper holes will now put the finish on the hull of the boat, excepting paint and putty. All the seams and screw holes should be filled with white lead putty, and the whole boat given two coats at least of best white lead paint. Now make the mast step of 1 in. oak by  $\frac{1}{2}$  in. wide, long enough to cross two spaces of the floor timbers. Bore two holes each 6 in. from either end, 2 in. diameter, then screw the step firmly to the floor timbers, as shown in diagram. Make two upper steps of  $1\frac{1}{4}$  in. cedar 6 in. wide, and cleat to the coaming so that ends will not press above the line of the deck. Bore  $\frac{25}{32}$  in. hole in each exactly plum over the bottom step holes. These upper benches may be made to drop on cleats easily, so that one may be removed when the other is in use.

Two places for the mast are provided because the entire control of the boat when on the ice is wholly by the trim of the sails, and it often happens that with reefed sails moving the mast to the after hole gives the boat a more perfect balance.

For deck and shroud plates cast brass fittings are the best. There are several good substitutes which will answer every requirement, however. For shroud plates

## British Letter.

THERE has been a good deal of discussion lately in the leading yachting papers as to the desirability of having a standard of classification for yachts which could be applied with benefit to the modern racer, and the Yacht Racing Association recently interested themselves in the matter sufficiently to appoint a committee to inquire into this subject among other matters, but, so far, without tangible results. The only system of classification which has been recognized over here, during the last twenty-five years, has been that of Lloyds, but as the rules governing this system had not been altered since their inception until last summer, and the form of racing yachts has undergone a complete metamorphosis during that period, Lloyds rules have been utterly inadequate as a means of classifying racing yachts for many years. Last year the committee of Lloyds undertook the complete revision of their rules, and in August they issued a new set of rules for the building and classification of wood, steel and composite yachts, in which they have endeavored to cope with the difficulty of providing a code of rules which can be applied with benefit to the construction and classification of the modern racing yacht.

In this matter they have only partially succeeded, and it will require the cooperation of the Yacht Racing Association to make a complete success of the new scheme. The Y. R. A. have more than once had thoughts of formulating a set of scantling rules to prevent the flimsy construction which has done so much to kill class racing in British waters; but their efforts have always been half-hearted and they shrink from anything like drastic changes, however much the changes may benefit the sport in the long run. There is a golden opportunity now for the governing body to combine with Lloyds to evolve a satisfactory system of classification for racers, and to make it compulsory for every racing yacht above a certain size, say 36ft., to be built sufficiently strong, with due regard to the stress and strain imposed by the heavy lead keel and big spread of canvas, to stand the wear and tear of one or two seasons' racing, and afterward be fit for use as a fast cruiser. Class racing in anything above a 36-footer is at a very low ebb, with the exception of the 52ft. class, and vested interests would by no means be hard hit by such a healthy innovation, besides which people would be much more willing to build if they could only be certain of getting the hall mark of Lloyds classification with their vessels, and knowing in that respect, all yachts would be treated alike, and the bandboxes rigidly excluded. Until something of this sort happens and the Yacht Racing Association exercises its undoubted authority much more freely than it has done of late, it will be quite hopeless to expect a renewal of class racing in Great Britain. It was hoped that something definite would have been done at the annual general meeting of the Yacht Racing Association, which was held on February 2, to try and establish class racing on a firm basis, but a motion by the chairman, Mr. A. Manning, that all yachts over 30ft. rating should be built to Lloyds new rules, and classed, did not meet with a seconder. It is true that Lloyds new rules as they stand are not quite suitable to the modern form of racing yachts, but very little alteration would be necessary to make them all that is desirable, and it is certain that until the Y. R. A. modify their rating rule so as to produce a more wholesome type of vessel, and put themselves in touch with the committee of Lloyds for the purpose of evolving a suitable code of rules for building and classification of racing yachts, prospective owners will not build big vessels for anything but the handicap class.

With the death of Mr. Robert Hewett, which took place at Salcombe, S. Devon, on January 21, there has been removed one of the best known yachtsmen of the old school. Mr. Hewett was Commodore of the New Thames Y. C. and Vice-Commodore of the Royal Thames, and his well-known figure was always a prominent feature on the club steamer in the river matches on the Thames at the opening of the season when his sound, common sense and good judgment were always in request and never withheld from the sailing committees. Mr. Hewett was more than a mere yacht sailor, for he was responsible for the design of the famous 10-ton cutter Buttercup, one of the most successful of the old plank on edge type of boats in vogue in the early eighties, which he sailed himself with a very large measure of success during four seasons. Buttercup was a big, full bodied boat, with high freeboard; and she differed from all the other boats in her class in that she had a short schooner bow which was afterward copied and called the "Buttercup bow." She was very fast to windward and a particularly powerful boat in a seaway. Mr. Hewett will be deeply regretted by a very large circle of friends in the yachting world, where he was deservedly popular. He did not take an active part in yacht racing of late years on account of his advanced age, but to the last he used to cruise quietly in his 40-ton Terpsichore.

There is a rumor that the new 65-footer, building at Fairlie, for Messrs. Connell is to be fitted out, and that the old Watson cutter Carina will be raced against her, so as to give the class a start. Unfortunately, no sport can result from such a combination if they sail on even terms, and the 52ft. class will have the chief place once more in class racing. Moyana, Lucida and Camellia will be under fighting colors. It is extremely doubtful if Viola will join them; but Fife has an order for a new boat for Mr. Samuel Butler, of Bristol, so that the class will muster four vessels and some excellent racing is sure to result. E. H. KELLY.

The annual meeting of the San Francisco Y. C. was held on February 10, and the following officers were elected: Com., A. C. Lee; Vice-Com., H. H. Jenness; Rec. Sec'y, W. H. Gray; Fin. Sec'y, A. G. A. Mueller; Treas., F. A. Robbins; Port Capt., Dan Miller; Meas., F. Raisch. All of these candidates are yacht owners, and for several years have been prominently connected with the affairs of the club.

SOUTH BAY SCOOTER—SAIL AND SPAR PLAN.

Cross Section showing curve of deck &amp; bottom

SOUTH BAY SCOOTER—CONSTRUCTION PLAN.

SOUTH BAY SCOOTER—STEERING PIKES.

two 7in. galvanized door hasps will answer by drilling each for screws. To put on, place perpendicular against outside oak band opposite aft mast hole, letting eye project above deck far enough to receive 1/4 in. S hook, then bend lower end under and snug up to bottom planking and fasten one on a side.

For deck eyes, a heavy galvanized 1/2 in. screw eye will answer for the bow, screwed well down into the oak stem piece. For the aft end, a heavy galvanized staple drove through deck into the oak stern will hold the main sheet pulley.

A 1/4 in. brass screw eye placed on the second deck timber from bow will hold the heel of bowsprit. Cut out underneath the bowsprit where it goes over the large screw eye so that the bowsprit will rest on the deck. Bore a 1/4 in. hole through the bowsprit exactly opposite the large eye so that a bolt will pass directly through eye and hold the bowsprit down. The bolt holes in the

bowsprit can be strengthened by bending a piece of rim band iron over top and down each side where the bolt passes through, reaming out the bolt holes.

Now make spars and hooks, bend sails, and you will behold a typical Great South Bay scooter. For a first trial select a moderate breeze. Trim the mainsail fairly flat, twisting the sheet around rowlock. Take the jib sheet (which is always a single part about 8ft. long), and, giving the boat a little start on the ice, jump into the cockpit. Watch closely the effect of trimming in or letting out the jib, and before you have sailed two miles you will have discovered the art of sailing a boat without a rudder. Find a small air hole of open water, and practice going into the water and out on to the ice at various speeds until you have gained full confidence in the scooter's safety under all conditions. After a few trials you will become master of the situation and an enthusiastic devotee of the new sport called "scootering."

## Boston Letter.

BOSTON, Feb. 22.—Ex-Commodore J. Malcolm Forbes, of the Eastern Y. C., a member of the Committee on Challenge of the New York Y. C., died at his residence in Milton, Mass., Friday, Feb. 19, after an illness of about a week. Commodore Forbes was born in Milton Feb. 2, 1847. He attended the English High School in Boston and was graduated from the Massachusetts Institute of Technology in the class of 1869. In business life he was the senior member of the firm of J. M. Forbes & Co., and was interested in railroad and electrical movements.

He was one of the foremost of American yachtsmen, and was identified with the defense of the America's Cup since 1885, when he was one of a syndicate of eleven which built the Puritan. He later became sole owner of this famous yacht, and, when he became Commodore of the Eastern Y. C., she was his flagship. In 1901 he became a member of the Committee on Challenge for the America's Cup of the New York Y. C., and served on that committee up to the time of his death. Up to the time of his death he was the owner of the sloop Volunteer, which defended the Cup in 1887. This yacht, with other smaller ones, he kept at his summer home, Naushon Island.

Commodore Forbes was interested in many outdoor sports, and was a fine athlete. He maintained a stock farm at Ponkapoag, in the Blue Hills, where some of the finest trotting stock in the country was kept. He owned the famous stallion Arion, for which he paid \$125,000, the highest price ever paid for a trotter in this country.

From his boyhood Commodore Forbes was a devoted yachtsman, and during his yachting career did much to develop the sport. He owned and raced many yachts. He was the sixth member of the Puritan syndicate to pass away since 1885, and was one of three prominent yachtsmen whose deaths have come within a month, the other two being Col. Hugh Cochrane and Mr. Henry Bryant.

Commodore Forbes was popular among yachtsmen. Under a rather gruff exterior there beat a kindly heart, and his sterling character made his friendship most valuable.

It was decided at the annual meeting of the Quincy Y. C. to build either a 15-footer or an 18-footer under the rules of the Yacht Racing Association of Massachusetts, the funds to be raised by subscription among the members. It is considered most probable that it will be an 18-footer which will be built. The boat will be raced on the Y. R. A. circuit during the coming season by members of the club, and at the end of the season will be turned over to the club to be rented to members until the members of the syndicate which furnished the funds for her construction shall have received such reimbursement as they may elect.

It has been announced that one of the owners of the 22-footers has offered a cup to be contested for by 22-footers in a race from Marblehead to the Isles of Shoals and return. It is the intention to start the race from Marblehead on Saturday evening, June 25, and it is expected that the finish will be made off Marblehead on the next afternoon. There will be a full moon on the evening of June 25. Six owners of 22-footers have already signified their intention of competing for the cup. Mr. Herbert H. White's steam yacht, Wild Goose, will be used as judges' boat, and will follow the yachts over the course.

At the annual meeting of the Eastern Y. C., the following officers were elected: Com., Laurence Minot; Vice-Com., C. H. W. Foster; Rear-Com., W. O. Gay; Sec'y, George Atkinson, Jr.; Treas., Patrick T. Jackson; Meas., Henry Taggard; Council at Large—George A. Goddard and Frank B. McQuesten; Regatta Committee—Henry Howard, chairman; Patrick T. Jackson, George Atkinson, Jr.; Stephen W. Sleeper, and Louis M. Clark, secretary; Committee on Admissions—Theophilus Parsons, chairman; James D. Colt, Robert Saltonstall, Charles S. Rackemann, and George Atkinson, Jr., ex-officio; House Committee—Parkman Dexter, chairman; Ernest W. Bowditch, Frederick O. North, George L. Clarke, and William B. Revere, secretary.

News of quite an extensive cruise for a 44ft. over all sloop has recently come from Capt. Charles S. Drowne, of Portsmouth, N. H., from Jacksonville, Fla. Capt. Drowne started in the sloop Valiant from Portsmouth on the morning of November 26, 1903, and arrived at Jacksonville on the evening of January 1, 1904. The trip was made all outside and the port to port runs were made very quickly. The trip, on the whole, was rather a pleasant one, although Valiant was obliged to remain at some places on account of the weather. Valiant was designed by Capt. Drowne and built at Portsmouth in 1894. She is 44ft. over all, 10ft. beam, and 7ft. draft. Capt. Drowne was the organizer of the Portsmouth Y. C., and is still an active member of that organization.

The House Committee of the South Boston Y. C. has announced the following schedule of entertainments for 1904: February 25, lecture by Hon. Arthur K. Peck on Yellowstone Park; March 15, special entertainment; April 7, hop; May 3, whist party, May 26, fancy dress masquerade; May 30, open house, refreshments in the Dutch room; June 14, hop.

JOHN B. KILLEEN.

## British International Cup for Motor-Boats.

Three challenges have already been received from France for the British International Cup for Motor Boats. Two of these entries are for boats driven by petrol motors, one from MM. Clement and the other from Messrs. G. Pitre & Co., and the third is a Gardner-Serpellet steam launch, entered by MM. Legru and Gardner.

No fewer than seven boats have been entered to defend the cup on behalf of Great Britain, two being from S. F. Edge, limited, the present holders; three from Messrs. J. E. Hutton, limited; one from Messrs. Thornycroft; and one from Lord Howard de Walden. This will necessitate an eliminating race being held to decide upon the three boats which are to represent England in the race itself.

Further entries, it is hoped, will yet be received from France, which will also necessitate an eliminating test, and if, as is confidently expected, entries are received from

Germany and the United States, the race will be the most representative and important international contest for motor boats that has ever taken place.—Yachting World.

## The Marine Motor Boat Exhibit at the Madison Square Garden.

THE motor boat and marine engine display at the Sportsmen's Show is one of the features of the exhibition. In previous years there has been a few motor boats and several engines on view, but the great increase in the number of these exhibits clearly demonstrates what marked progress has been made in this branch of yachting during the past year, and how widespread is the interest in these useful, practical and convenient contrivances. The present marine exhibit is a tribute to the energy and enterprise of the gasoline engine manufacturers.

The marine exhibits quite overshadow the displays that have hitherto attracted all the attention, and from the time the Madison Square Garden opens until it closes crowds devote themselves to looking over the boats and engines. The marine motor is now becoming understood, and the visitors study the mechanical devices of the engines and the construction of the different boats in a more intelligent and understanding manner.

The motor boat has gained a firm foothold both for utility and pleasure, and is here to stay. It is not a fad, and it is destined to play an important part in water sport and transportation in the future.

The boats that come in for the greatest attention are those that are being exhibited in the big tank which occupies the larger part of the main floor. In the tank are four mahogany boats all intended for high speed work. One of these craft—Vingt en Un—has already gained much prominence, and has shown remarkable speed on her trials on the Hudson River. She was designed by Mr. Clinton H. Crane, of Messrs. Tams, Lemoine & Crane, and is fitted with a Smith & Mabley engine. Vingt en Un is a clean looking boat, and is perhaps more pleasing to the eye than any of the other high speed boats displayed. Smith & Mabley have a large space at the eastern end of the tank.

The two high speed boats that are fitted with French automobile engines have interested many. These boats are being shown by Messrs. Panhard & Levasser, and Messrs. Hollander & Tangerman. The hulls of both are similar in design, having fine bows with pronounced turtle-back decks and wide and heavy torpedo boat sterns. The boat being shown by the former firm is named Panhard, and the latter is known as F.I.A.T. The owners of F.I.A.T. have challenged those interested in Vingt en Un to a match race for \$1,000 a side, which is to take place early next summer. Messrs. Hollander & Tangerman are now willing to increase the stakes to \$5,000 a side and race one-design boats, so that the contest would be a test of motors.

The fourth boat being shown in the tank is Dolphin II., which craft was designed by Mr. E. F. Graef, and is equipped with a specially designed Standard motor. She is a very likely looking boat, and presents a striking appearance as her decks are of burnished sheet copper. Her owners expect she will develop about 18 miles, but it is more than probable that she will exceed this. She ought to make a good showing with the other high speed boats being shown, and we hope they will meet next season in some speed tests.

None of the boats on exhibition show up to better advantage than does the mahogany launch that was built at Morris Heights. She is a beautiful piece of work, and is fitted with a Seabury motor. She is not intended for great speed, and is of rather heavier construction than the racing craft.

The Buffalo Motor Co. has a very fine exhibit on the south side of the main floor, and there are a number of their engines of various horse-powers being shown. Many improvements have been made in this engine, and the 1904 model ranks well at the head of American-made gasoline motors.

Water Boy is the name of the boat being shown in the tank by the Lozier Motor Co. She is a smart looking boat, and is well built and finely equipped. This firm are exhibiting a number of their motors.

The Isham Company, of Norwich, Conn., have fitted up their space in a most unusual way, and in consequence catches the eye of many. Their exhibit is well arranged, and the models of some of the numerous launches they have built are handsomely finished.

The Eagle Bicycle Mfg. Co., of Torrington, Conn., have several of their reliable and compact-motors in their space. This engine has many good points, and is particularly adapted to smaller boats, where the smaller horse-powers are needed.

While the gasoline motor boats are in demand, the craft propelled by electricity have many admirers. The Electric Launch Co., of Bayonne, are showing many interesting things that relate to electric propulsion.

Among the other exhibitors, of which more will be said later, are the following:

Pierce Engine Co., Racine, Wis.; C. H. Blomstrom Motor Co., Detroit, Mich.; Western Launch and Engine Works, of Mishawka, Ind.; White Craft and Power Co., Port Richmond, N. Y.; Charles A. Strelinger Co., Detroit, Mich.; Lackawanna Motor Co., Detroit, Mich.; Fairbanks Co., New York; Richardson Engineering Co., Hartford, Conn.; Spaulding Gas Engine Co., New York city; August Mietz, New York city; Victor Metals Co., New York city; Cushman Motor Co., Lincoln, Neb.; Abercrombie & Fitch, New York city, and the Pneumatic Mattress and Cushion Co., New York city.

The Standard Boat Co., of Long Island City, is building a gasoline launch from designs made by Mr. Arthur Masters, for Dr. C. B. Mathewson, of Plainfield, N. J. The boat is to be 55ft. long; 10ft. breadth; and 3ft. draft. Her power will consist of a 20 horse-power Standard engine. Mr. Masters has gotten out plans for a three-masted auxiliary schooner for Mr. Edward R. Cassidy, of Altamont, N. Y. She will be 144ft. over all; 116ft. waterline; and 13ft. 6in. draft. She will be fitted with a 40 horse-power Standard engine.

## Designing Competition.

### \$225 in Prizes.

Two designing competitions have been given in FOREST AND STREAM. The first was for a 25ft. water-line cruiser; the second was for a 15ft. one-design class. Both competitions were very successful. The great interest taken in those competitions has prompted us to give a third one, open to amateurs and professionals. The prizes which will be given are as follows:

First prize—\$100.

Second prize—\$60.

Third prize—\$40.

Fourth prize—\$25, offered by Mr. Theodore Zerega for the best interior plan.

The designs are for a yacht conforming to the following conditions:

I. Centerboard cruiser, 40ft. l. w. l.

II. Boat must not draw over 6ft with centerboard up.

III. The lowest freeboard to covering board must be 3ft.

The design must be modern in every particular, without containing any extreme or abnormal features. The conditions have been made as simple as possible, that competitors might have all latitude and scope in working out their ideas. We wish to produce an able and comfortable cruising boat, one that shall have ample accommodation for two or three men living aboard for a period of several months, and one that can be easily managed at all times by two or three paid hands. The draft is restricted to 6ft. in order that the boat may have access to nearly all the desirable harbors, and may, thereby, widely increase her cruising field.

### Drawings Required.

I. Sheer plan, scale  $\frac{3}{4}$ in.=1ft.—showing center of buoyancy, center of lateral resistance and center of effort of both rigs.

II. Half breadth, scale  $\frac{3}{4}$ in.=1ft.

III. Body plan, scale  $\frac{3}{4}$ in.=1ft.

IV. Cabin plan, inboard profile and at least one cross section, scale  $\frac{3}{4}$ in.=1ft.

V. Two sail plans, scale  $\frac{1}{4}$ in.=1ft.; one as a yawl; one as a pole mast sloop.

In the case of the yawl rig the position and height of the mast and length of gaff are to be the same as in the cutter rig. Plans must show working topsail and size of light sails.

VI. All ballast outside on keel except amount necessary for trimming.

An outline specification must accompany each design. The drawings should be carefully made and lettered. All drawings should be on white paper or tracing cloth in black ink. No colored inks or pigments should be used. The designs must bear a nom-de-plume only, and no indication must be given of the author. In a sealed envelope, however, the designer must inclose his own name and address, together with his nom-de-plume. All designs must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York City, not later than March 1, 1904. All drawings will be returned, but postage should accompany each.

The FOREST AND STREAM reserves the right to publish any or all of the designs.

Mr. Clinton H. Crane, of the firm of Messrs. Tams, Lemoine & Crane, who passed upon the designs submitted for the 25ft. with great care, has again consented to judge the designs and make the awards.

## Jolly Tar.

LAST season Jolly Tar was raced in almost all of the contests for her class, winning the championship pennant of the Yacht Racing Association of Long Island Sound, in the open 21ft. racabout class, which is admitted to be the keenest small boat racing class on the Sound, there having been sixteen competitors in this

JOLLY TAR.

Owned by Slocum Howland.

Photo by H. N. Tiemann, New York.

class. It being not an uncommon thing to see nine or ten of these boats in a single race last season.

She also won the cup given by Com. H. W. Eaton, for the championship of the American Y. C. one-design class, winning all six races of this series.

Jolly Tar was designed by Mr. B. B. Crowninshield and built by Rice Bros., of East Boothbay, Me., in 1902, being one of the seven one-design raceabouts that were built for members of the American Y. C. of Rye, N. Y. She is owned by Mr. Slocum Howland, of Catskill on the Hudson.

## YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

Mr. and Mrs. H. Sinclair, Miss Marjorie Sinclair and Lewis R. Freeman, left Los Angeles early in February on the schooner yacht Lurline, for a year's cruise of the South Seas. The cruise of Lurline will be to the Hawaiian, Society, Fiji, Ellice, Gilbert and Marshall Islands, returning by way of Japan. Mr. Sinclair is a master mariner and has rounded out a good many years on the seas.

Rev. Dr. Wilton Merle Smith, Seawanhaka-Corinthian Y. C. has purchased, through the agency of Stanley M. Seaman, the auxiliary yawl Idelon, from Wm. E. Heiser, Baltimore, Md. She is 55ft. over all; 35ft. waterline; 14ft. beam; 6ft. draft; designed and built, 1903, by the L. J. Nilson Yacht Building Co., Baltimore.

Frank Bowne Jones has recently made the following sales: The schooner Regina, owned by Mr. William A. Hamilton, to Mr. Henry F. Noyes; the yawl Sagiola, owned by Mr. C. O. Herx, to Mr. A. C. Bancker; and the schooner Javelin, owned by Mr. C. A. Rutter, to Dr. W. W. Greer.

The report of the Regatta Committee of the New York Y. C. has been issued. The booklet is splendidly gotten up, and the race reports are complete. The brochure is illustrated by fine half-tone pictures.

Mr. M. J. Kiley, of Boston, has issued a compact little book which contains the official tide tables of the Atlantic Coast for 1904.

The Rochester Y. C., at a meeting recently held, elected the following officers: Com., Chas. M. Everest; Vice-Com., W. H. Briggs; Fleet Capt., F. T. Christy; Sec'y-Treas., Thos. G. Young; Cor. Sec'y, L. G. Mabbett; Meas., Wm. H. Pillon, Jr.; Fleet Surgeon, Dr. T. O. Tait. Directors for two years, W. G. Hull, Frank Oumpagh.

There is building, by the Electric Launch Co., of Bayonne, from designs made by Mr. Henry J. Gielow, a speed launch for Commodore Harrison B. Moore, Atlantic Y. C. She is to be 60ft. over all; 58ft. waterline; 7ft. breadth; and 3ft. draft. She will be an open boat and will have three cockpits. The planking will be double, the inner skin being of cedar and the outer of mahogany. The yacht will be equipped with a 175 horse-power Craig motor.

The Boston schooner Rondina has been sold by Mr.

D. C. Percival, Jr., to Mr. George E. Ide, of New York, and the yacht Dragon by Mr. W. T. Emmet to Mr. James Baird, of Philadelphia.

United States Consul H. W. Metcalf, of Newcastle-on-Tyne, England, sends a report of the launching there on January 11, 1904, of the yacht Erthogroal, built for the Sultan of Turkey. The launching was preceded by a religious ceremony peculiar to the Turks, after which the ship was christened in the usual way by breaking a bottle of champagne over her bow by the wife of the Turkish ambassador. Erthogroal is up-to-date in every particular—in length, 260ft.; breadth, 26ft. 6in.; mean draft, 15ft. Her displacement is 900 tons. The yacht is built entirely of steel. Erthogroal will have an armament of eight 3-pounder guns and a speed of 21 miles per hour.

The bill prepared by the Great South Bay Improvement Association has been introduced in the Senate by Senator Bailey, and in the Assembly by Mr. Cocks. This is a part of the plan to give an inside waterway from East Rockaway Point to Orient Point, on the eastern end of Long Island, making use of the Great South Bay.

The annual meeting of the Larchmont Y. C. was held on the evening of February 17, at Delmonico's. As none of the flag officers was in town, Justice F. M. Scott presided. The following officers were elected: Com., Morton F. Plant, schooner Ingomar and steamer Parthenia; Vice-Com., Albert C. Bostwick, auxiliary schooner Vergemere; Rear-Com., Frederick M. Hoyt, cutter Isolde; Sec'y, A. Bryan Alley; Treas., William Murray; Meas., John Hyslop; Trustees, to serve three years, William B. Jenkins and Jacob Halstead.

The following amendment to the racing rules was adopted:

Any yacht crossing the starting line before her starting signal, shall be recalled by the hoisting of a red ball, attention being called to same by a short blast of the whistle or through a megaphone. Should more than one yacht cross the starting line before the signal, there shall be a short blast of the whistle or megaphone call for each yacht crossing.

The report of the Secretary, A. Bryan Alley, showed the organization to be in a very prosperous condition. There are at present enrolled in the club 39 schooners, 10 auxiliary schooners, 192 sloops, cutters, and yawls; 26 mainsail yachts, 99 steamers and 49 launches, making a total of 415 boats.

The annual meeting of the Philadelphia Y. C. was held on Wednesday, February 10, at the club house, Tinicum, Delaware Co., Pa. The following officers were elected: Com., William H. Bromley; Vice-Com., Philip

H. Johnson; Rear-Com., J. Anderson Ross; Sec'y, C. Carroll Cook; Treas., George T. Gwilliam; Fleet Surgeon, Dr. Frederick J. Haerer; Harbor Master, Lloyd Titus; Trustees, A. L. English, Robert C. Thompson, T. W. Bookhamer, George W. Fite, J. William Good, Alexander G. Rea, James T. Ramsdell; Race Committee, C. Carroll Cook and Robert C. Clarkson. The organization is in a healthy condition financially, being free from floating debt, with a fleet of 55 yachts. Extensive improvements have been made to the club property, and it is now a thoroughly modern yachting home.

Mr. W. K. Vanderbilt, Jr., is having a high speed motor boat built by Mr. Robert Jacob at City Island. The boat is 40ft. long; 35ft. waterline; and about 6in. draft forward, decreasing to nothing on the waterline at the stern. The boat will be double planked, the outer skin being mahogany. The power will be furnished by a French automobile engine.

All the models added to the New York Y. C.'s collection in the future will be made according to the following scales: For all yachts more than 300ft. L.W.L., one-eighth of an inch to the foot; for all yachts more than 200ft. L.W.L., three-sixteenths of an inch to the foot; for all yachts more than 100ft. L.W.L., one-quarter of an inch to the foot; and for all yachts of 100ft. L.W.L. and under, three-eighths of an inch to the foot; half models will show the starboard side, and must be painted to correspond with the color of the yacht.

The late Queen Victoria's old yacht Victoria and Albert is to be broken up at Portsmouth. Relic hunters will be disappointed to know none of the wood is to be sold, but all to be burned.—London Mail.

Secretary Edward M. MacLellan, of the Manhasset Bay Y. C., has received a challenge from the Atlantic Y. C. for the Manhasset Bay Challenge Cup. The Atlantic Y. C.'s representative will be Bobtail, a Herreshoff production, owned by Mr. E. F. Luckenbach. Bobtail was one of the unsuccessful competitors in the races for the cup last season—finishing fourth in the series.

Mr. C. F. Herreshoff is now working on plans of a high speed motor boat for Mr. F. A. La Roche. The boat will be 32ft. long, 8ft. breadth, and 18in. draft. She will be fitted with a 20 horse-power engine.

At the Herreshoff's plant, at Bristol, there are building four 18ft. knockabouts and a 40ft. waterline cutter for Mr. Eaton, of Boston.

## A. C. A. National Meet, Sugar Island, Thousand Islands, St. Lawrence River, August 5-19, 1904.

### Officers of A. C. A., 1904.

From Chapter I., Section 1, of the by-laws of the A. C. A.: "Application for membership shall be made to the Division Purser, and shall be accompanied by the recommendation of an active member and by the sum of two dollars, one dollar as entrance fee and one dollar as dues for the current year, to be refunded in case of non-election of the applicant."

## The Shenandoahs Cruise the Greenbrier.

BY F. R. WEBB ("COMMODORE"), OF STAUNTON, VIRGINIA.

### The Story Which Won the Fourth Prize of \$10 in "Forest and Stream" Cruising Competition.

#### II.—The Log.

(Continued from page 156)

WEDNESDAY, JUNE 24, 1903.

Beall woke me up a little before 5 o'clock this morning by ringing the "rising bell," which I had carefully placed by the side of my canoe last night for the purpose of surprising him this morning—the rising bell, it may be stated in passing, is an old calf bell picked up in some farm lane years ago, on one of our Shenandoah cruises, and carried ever since, to do duty as an arouser of mornings, as well as to summon the various members of the cruising party from labor to refreshment at

meal times and other convenient times—and I was soon out and dressed by the side of a cheery little blaze of a camp-fire, which George had revived from the remains of last night's fire; for the night had been sharply cold, and the morning was keen at that early hour, with a damp, dispiriting fog hanging heavily and clammily over the surface of the earth, obscuring everything, so that even the trees across the narrow little river loomed up like vague shadows, dimly seen. We speedily had breakfast, after which the camp things were cleaned up and assorted, a division of plunder made, the canoes packed and launched and the cruise was on.

The river at the starting point is a charmingly beautiful little mountain stream, but a few canoe lengths in width, and with apparently plenty of clear amber colored water, most beautifully limpid, after the manner of mountain streams, and the cruise promised well. The start was made, however, by each of us wading most of the mile between our camp and the confluence of the two prongs, as, while there was plenty of water, the rocks were still more plentiful, so interminably plentiful, in fact, that it seemed impossible to stay in the canoes for any length of time, or distance; as no sooner were we clear of one obstruction and seated in our canoes than we would again hang, and a step overboard was necessary, in order to lighten over the obstruction. Our cruising costumes consisted of short trousers, long stockings and hob-nailed canvas shoes, flannel shirts, and bamboo helmets, so that wading was provided for. We expected to do considerable wading in this upper section of the river, and we were assuredly not disappointed in this respect.

For good, strenuous cruising I can cordially recommend a good, healthy, well developed trout stream at a good stage of water. It will develop canoeing in a new light to the oldest and most experienced cruiser. We thought we were pretty well up in the matter of

experience, since our quite considerable supply of this useful commodity had been gained exclusively on swift rivers, abounding in rapids and rocks; but the first 5 miles of this swift, brawling mountain stream convinced us that we had to develop an entirely new line of the article, and of a quite different brand. We found at once that our estimate of the fall of the stream was correct, or at least, that we had not underestimated it, for it was simply a rattling down-hill plunge all the way, with no pools or eddies, or at most but of the shortest; while the rocks were simply interminable, and of assorted shapes and sizes—mostly large. It was amazing how any one small river could hustle around and unearth so many rocks, and scatter them around so carelessly and so promiscuously. The cruising was fatiguing to the last degree and wearing on our nerves until they were fairly strained to the breaking point. With good water no sooner were we seated in our canoes, with a promising reach ahead, than we would hang hopelessly on the rocks, and all there was to do was to step overboard in water never less than knee deep—and more often deeper—lift off and step in again with dripping feet, only to repeat the proceedings as soon as seated. The rapids were, for the most part rather broad and correspondingly shallow, although there was generally a sufficiency of water, barring the interminable and infernal rocks. We were not long in finding out that we had to develop an entirely new line of tactics in running these rifts. The tactics were very simple. It was not worth while to try and pick out the best water as we went down. All that was practicable was to size up a rapid as accurately as possible from the crest, and select a course straight down; and then hold the canoe in a straight line from top to bottom and drive her down, without making any attempt to veer right or left in search of better water, or to avoid the rocks. By following this simple plan we would occasionally succeed in forcing a canoe down over the intervening rocks to the bottom of a rapid, without a dismount, while any attempt at a veer to one side or the other invariably resulted in a hopeless entanglement with the rocks. The railroad followed the right bank of the river more or less closely all the way down, and we not infrequently came upon rattling little plunges close up under the railroad embankment, where the stream was considerably narrowed by the rocks and debris tumbled down into the

On the Upper River (Cass).

river bed in blasting out the right of way. When we sighted one of these brawling shoots we speedily found that there is trouble in store for us, and we ran each one at the more or less imminent risk of a capsize or swamped canoes. The water was so strong that anything started in at the top was sure to go through to the bottom in some shape or other, and if a hang-up occurred an instant spring out into the swift water—of unknown depth—was the only means of preventing disaster. Any skill in dodging rocks was of little avail; they were too thick to dodge. All we could do was to select the clearest looking course from the top, put our canoes into it, bow on (if we could succeed in getting over the crest and into the chute without preliminary disaster), and drive straight down. The getting through the inevitable fringe of loose rocks at the bottom of each plunge was purely a matter of chance; and when we finally finished this day's cruise, right side up and with whole canoes, it was a matter of congratulation to both of us. Our progress was necessarily slow under these conditions, and noon found us with but half of the 15 miles to Cass behind us. A clean little rocky beach at the foot of the mountain, well shaded and with a little stream of cold water rippling out of the dense undergrowth from some hidden spring offered an inviting place for our midday lunch, and we were soon ashore, with our canoes drawn up on the beach at our feet. With one accord both suggested that the cruise was so arduous that the half day's run was quite enough for the day, and we finished the job by drawing the canoes ashore and making camp, after which an ample lunch was in order. It is our regular custom in cruising to get up hot meals for breakfast and supper, but to have a cold lunch a la picnic at noon, usually consisting of deviled ham or sausage or some of the numerous potted goods put up for this purpose; but on this cruise half-day runs proved to be the rule, and whenever we finished a day's cruise at lunch time, and the camping outfit had to be unpacked anyhow, a hot cup of coffee was always in evidence, generally flanked by a hot can of pork and beans, or sausage, or a steaming pan of soup and succotash. The plan was a good one, and added much to the comfort as well as the pleasure of the cruise.

After dinner the canoes were lined up in position for the night, and the camp put in shape, after which a bath in the cold stream and a siesta were in order, for we were fatigued to the last degree.

Aside from the difficulty of cruising it, the river is a charmingly beautiful and interesting stream. Small, swift and narrow, it is picturesque and interesting, while the scenery is wild and, when out of sight of the railroad, completely primeval, looking as though the foot of man had never invaded the region. Flowing as it

does, at the bottom of a deep, narrow gorge between parallel mountain ranges, the mountains rise steeply on each side almost to the clouds with but little if any low land. Always on the one side or the other—frequently on both—a mountain wall towers aloft into the skies, densely wooded to the water's edge, and the scenery is picturesque and primitive.

Night fell early at the bottom of the deep gorge in which we were encamped, and long after we were shrouded in the thickening gloom of twilight the narrow strip of sky overhead shone brightly, and showed that day was still lingering in the world above. The bright beams of a new moon penetrated to the bottom of the gorge, as the thick crescent sailed across the streak of sky above; in whose rays the swift water flowing with a musical murmur at our feet glittered with a silvery radiance, while the flickering light of our little camp-fire dispelled the depressing gloom of the

The Confluence of the Two "Prongs" of the Greenbrier.

encompassing mountain walls. After our evening pipes around our cheerful camp-fire we soon turned in for a good night's sleep.

THURSDAY, JUNE 25.

I rang the rising bell at 5 o'clock this morning, but George did not turn out with the alacrity to be expected of a man who desired an early morning start. I did not feel at all well, and was not particularly enthusiastic about an early rise myself, and when George finally appeared it developed that he did not feel well either, so instead of packing up and starting after breakfast as usual, by mutual consent we let things remain as they were, and laid around camp all that forenoon. We loafed, read, wrote letters, and I wrote the log up to date, fished a little and otherwise put in the time. As the result of watching Jim, while in camp with the Greenbrier Club, I had tried my hand at some corn cakes for supper last night as well as for breakfast this morning, with fair success. They did not taste just right, somehow, and on examination this morning the meal was found to be of an inferior quality—having been bought at a country store of minute proportions in Durbin—and musty besides, which, taken with our extreme fatigue of the evening before, seemed to account for our feeling so badly this morning. The meal was promptly fed to the fishes, and further experiments in the hoecake line were deferred until a fresh supply of meal could be obtained. A pot of hot coffee at lunch time had its effect in bringing us around again, and after lunch we packed up and launched the canoes and made a short afternoon cruise to the head of the Cass mill pool, which was but a repetition of yesterday's cruise, extremely difficult and fatiguing; good water and swift, and full of rapids, with beautiful mountain scenery; but a river so thickly strewn with big rocks that it was

Looking up the "Near Prong" from Durbin.

all but impossible to avoid them, and we have never made a cruise on any stream before, even in the extreme of low water, where we were out of the canoes and into the water anything like so much. It was not much after 4 o'clock when we reached the head of the backset from the Cass dam, which was but little over a mile below; but we were both too tired to think of attempting the portage of the big 15ft. dam this evening, so, finding a fairly good place for a camp, on the left bank directly across from the railroad, we landed and hauled the canoes up out of the river on to the bank, and went into the camp for the night. We had a royal supper, consisting of a can of mock turtle soup, into which I poured a can of succotash, and after our evening pipes around our usual camp-fire we turned in early.

FRIDAY, JUNE 26.

I had a bad night of it last night, with a severe attack of rheumatism in my left leg and knee, probably brought on by too much wading in the icy waters of the upper river while trout fishing up there last week, and I feared this morning that it was all up with the cruise. But after I had bathed the limb copiously with some excellent liniment produced from George's clothes

bag, and had got out and stirred round a little it wore off to some little extent, although I was still in a decidedly crippled condition, and we decided to drop down to our old camp ground at Cass, which was but a short distance below the dam, and camp there for two or three days and give it a chance to wear off. We had breakfast, and packed and launched the canoes, and after a short, easy paddle through the deep, slack water of the pool, we reached the big Cass dam. Owing to its high and construction, as well as the lay of the land at each end of the dam, this structure presented unusual difficulties in the way of a portage; but while fishing here last week with the Greenbrier Club, George and I figured out that the sluiceway at the left end of the dam offered the only practicable portage, so we paddled over into this and landed on the crest of the dam, and succeeded, after an hour's delicate and careful work, in sliding the two canoes over the crest and down the steeply sloping face of the dam on to the wet and slippery apron below, from which they were safely and easily pitched head first into the deep water under the dam. Getting into the boats, once they were afloat below the dam, presented an apparently insurmountable difficulty, and as the only practicable way out, I finally climbed up the face of the bluff and worked my way around the pool and down upon the rocks below, with the intention of having George shoot the canoes across to me. But when I got to my position on the rocks below, George was out in the pool, astride the aft deck of his canoe with my boat in tow, and soon succeeded in working his way over to the rocks on which I stood. We led and shoved our canoes down the steep, rocky rapid immediately below the dam; and then, alternately wading and paddling, we dropped down past the town to our last week's camp ground, where we went into camp to wait until my rheumatism developed further intentions as to what it had in mind to do. I had at first intended looking up a doctor, but on reaching camp decided to wait until to-morrow, and then if I felt no better, put myself under the care of one. As we expected to remain here for two or three days we put up our camp in good shape, with the dining fly erected over the mess table, and otherwise made ourselves as permanently comfortable as our really ample resources would allow. My rheumatic attack really caused no delay, for the day promised to be a rainy one; and after we were

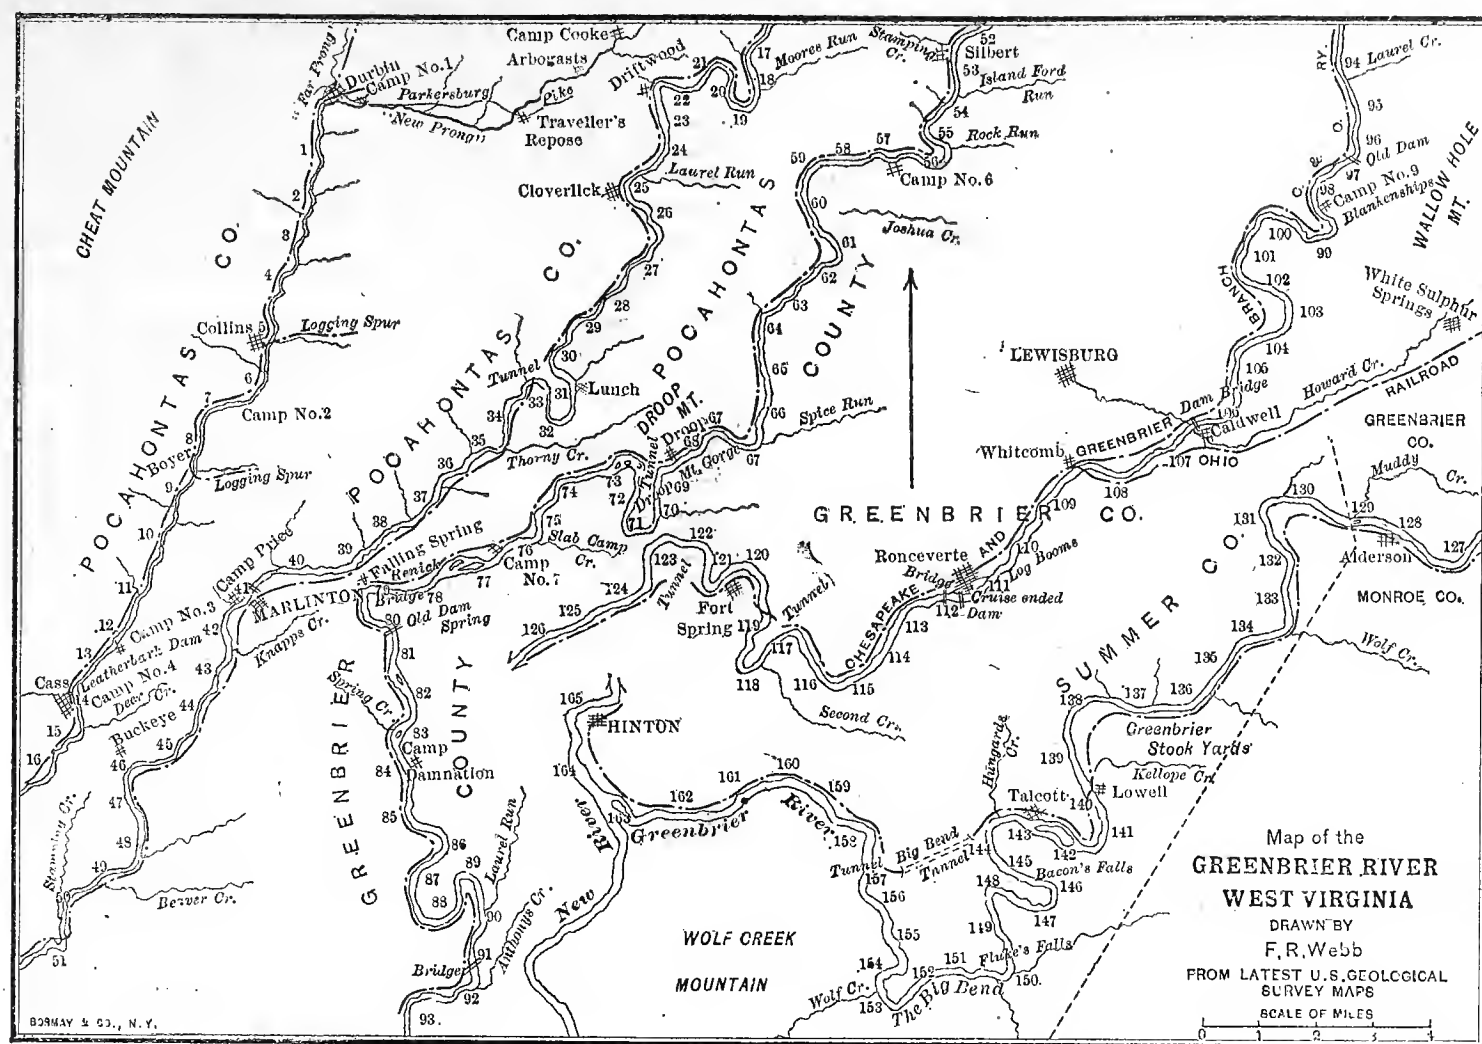

The "Far Prong," Durbin.

well established in camp it rained heavily, more or less all day. Although we are well provided with rubbers it is practically impossible to cruise this upper river in the rain, as we are in and out of the canoes so much that a thorough wetting of ourselves, and more or less of our camp equipment, is inevitable, to say nothing of the increased difficulty of running the river with the rain beating on the water, and obscuring the surface signs. We had lunch and a cup of hot coffee under the dining fly, and the afternoon was passed cozily in our respective tents, reading and dozing, while the rain pattered briskly on our canvas roofs with a soothing, musical murmur. After a good hot supper and a short evening with our pipes under the shelter of our fly, with the gloom of the damp, chill evening dispelled by a brisk camp-fire, we turned in for the night.

SATURDAY, JUNE 27.

We were stormbound here all day, as it rained more or less hard and steadily, from morning until night. My rheumatism gave me but little trouble during the day, in spite of the unfavorable weather, and I abandoned my intentions of consulting a doctor, and gave it no more attention beyond frequent applications of George's liniment. We did not find the little straggling wooded village of Cass particularly interesting, and it certainly is not in the least picturesque, with its white wooden houses all built on the same plan, and scattered around among the stumps along the rudimentary streets laid out on the sloping surface of the cleared mountain side. It is essentially a lumber and milling town, and the entire village centers around the immense mill-plant, and belongs to the West Virginia Spruce Lumber Co., together with about 100,000 acres of virgin lumber and mountain country, extending up on to Cheat Mountain and down Cheat River for about 20 miles, access being had to this vast region by means of a rudimentary railroad for logging purposes, of a character which does not take grades into much account, so long as they run down toward the mills, so that the heavily loaded log trains will have down grades to come in on. The locomotives used on these log roads are peculiar in construction. The driving wheels—and all the wheels are drivers—are small, and the engines, usually three or four cylinders, are all on one side, and geared to the wheels, instead of being applied direct. They are not noted for high speed, but are immensely powerful, and drag their strings of empties up the steep grades with perfect ease. The building of the Greenbrier branch of the Chesapeake and Ohio road along up the river and through this valley has opened up an immense and very valuable region of timber lands, otherwise lying completely dormant for lack of facilities for getting the timber and

lumber out to market. For years attempts have been made to get the timber out in the shape of immense log rafts, which were run down the river to Ronceverte on flush water; and enough logs were handled in this primitive manner to keep the great mills at Ronceverte supplied most of the time, but the method was uncertain and risky, and only available for a comparatively small part of the year, as the river is not navigable for logs or anything else except in periods of high waters. Our camp was directly across the river from the lower part of the village, and the frequent passage of trains along the railroad, which ran directly along the river bank across from our camp, afforded us occupation and interest. The novelty of seeing a railroad train in this hitherto remote and inaccessible wilderness did not seem to wear off. It is a regular little toy railroad as to the passenger service. The distance from Ronceverte at the bottom of the road to Durbin, at the top is 99 miles—just under the 100 mile limit, which gives the philanthropic railroad people the opportunity to stick on a passenger tariff of 4 cents per mile—and there is but one train a day each way, as this train easily makes the round trip in a day the same train crew and same engine and coaches do the entire passenger business; leaving Ronceverte about 8 o'clock in the morning, and reaching Durbin at 1 o'clock. An hour is spent there for dinner, reversing the train, etc., and at 2 o'clock the return trip is commenced, and the train and crew reach Ronceverte again about 5 or 6 o'clock in the evening. The train crew therefore live in Ronceverte, and are practically at home all the time, being away each day for dinner only. There are several freight trains daily, and the company seems to have utilized their old back number engines for this service, since the loads are all one way, down the river to Ronceverte; and as the average grade of the road, like that of the river, is soft to the mile, the immense lines of huge logs, twenty or thirty cars to the train, glide along down the road of their own momentum; while on the return trips the old scrap-heaps of engines go pounding up the road with much coughing and clanking and laboring over their long strings of empties. These trains became familiar objects to us as we slowly worked our way down the river, and the various engine crews soon learned to know us as they passed us, in camp or drifting idly down the river, and we never failed to get a salute in the way of a waving of hats or the scream of a whistle as the trains rumbled by us, up or down the road.

SUNDAY, JUNE 28.

We had another day of rain, and of idling, loafing, reading and writing letters in camp, and we have grown so tired of the place that this afternoon we began to pack up our things in desperation, determined to get away at all hazards; but the rain coming on again with renewed force caused us to speedily unpack again, and take to our tents, with the determination to make a start in the morning, weather or no weather, unless it was actually raining heavily. What with the several days spent here last week in camp with the Greenbrier Club, and the three days we have been stormbound on this cruise, we have spent fully a week on this one camp ground, and we are finding it quite monotonous. We did not tarry long over our pipes and the camp-fire to-night, but sought our tents early, with the hope of an early start in the morning. The rains have been of service to us in one way at least, as they have given us several inches more water, with the prospect of still more in the morning. We do not want too much water, as fishing is to be a prominent feature of this cruise, and we already have too much water for good fishing; but we will be glad to get all the water we can within reason—no flood, thank you—until we get 25 or 30 miles further down, when we hope to get out of the extreme rocky part of the river, and find improved cruising.

#### A. C. A. Membership.

The following have applied for associate membership to the A. C. A.:  
L. D. Moore, Pittsburgh, Pa.; Dr. W. A. Jaquette,

Salem, N. J.; Charles Stebbins, Rochester, N. Y.; Herman Schoenau, Buffalo, N. Y.; T. H. Barrington, Upper Montclair, N. J.; W. G. Harrison, New York; Perry H. Dow, W. W. Simmons, Frank L. Lamson, Manchester, N. H.; Fred Van Fleet, Detroit, Mich.; B. F. Cromwell, Jr., of the Knickerbocker C. C.; Chas. R. Smith, Trenton, N. J.; J. Fischer, Austin, Mass. The following are all residents of New York and members of the Fort Washington C. C., proposed by W. Allen and E. A. Bulkeley: H. Schrader, J. E. Zdanekiewicz, John Zdanekiewicz, Alfred Von Dohln, F. Krauss, Wm. J. Flynn.

#### CANOEING NEWS NOTES.

The dinner and election of the Irondequoit C. C. was held on Wednesday evening, January 6, in Rochester, and the following officers were elected: Com. John S. Wright; Vice-Com., Frederic K. Knowlton; Purser, Herbert H. Freeland; Directors, Augustine J. Cunningham and Campbell A. Baird.

The annual dinner and election of the Sa-wen-his-hat C. C., of Rochester, was held at the Powers Hotel on January 4, and the following officers were elected: Com., S. Gardner Raymond; Vice-Com., Charles E. Hoyt; Purser, William H. Samson; Directors, H. H. Edgerton and Bernhard Liesching.

### Rifle Range and Gallery.

June 12-20.—National Schuetzenbund Festival, Union Hill, Schuetzen Park, N. J.

#### Hudson vs. Dorrier.

THE two expert riflemen, Dr. W. G. Hudson and M. Dorrier, shot an individual match, 100 shots, on the Greenville, N. J., range on Feb. 22. Dr. Hudson is considered the champion of our Eastern 200yds. riflemen. His score of 2301 last November gives him prestige over all of the group at this time. Dorrier, another expert, held the record of 2257 on the German ring target until Hudson made his great score last fall. Since then Dorrier has had a desire to meet Dr. Hudson in an individual match. The Doctor met the suggestion of Dorrier with promptness, and informed him that he hoped he would be in condition to eclipse the record score of 2301.

The day opened up in the worst possible condition for rifle shooting. Rain and fog prevailed. Between noon and 1 o'clock the weather cleared up, and the match was started.

Many riflemen and friends were present to see the contest decided.

Among the visitors were H. M. Pope, Springfield, Mass.; J. H. Barlow, New Haven, Conn.; Dr. Blair, Trinidad; Colonel and Mr. Hastings, of Buffalo, N. Y. There was a large group of local rifle exponents.

At the opening of the match Dr. Hudson took a strong lead, and gradually increased it until at the finish he was 52 points ahead.

Dorrier was in bad form in the start and virtually lost the match in his first score of 10 shots.

At the close of the match Dorrier requested another opportunity in which to vindicate himself. The Doctor complied, and another match will be shot in the near future. The scores follow:

Dr W G Hudson.....	24	21	21	24	22	20	21	23	24	23	223
	24	22	19	21	24	22	23	22	24	23	224

#### New York Central Corps.

CAPT. C. TIETJEN got eighteen of his corps members together in the Zettler gallery on Feb. 17 for the regular bi-monthly shoot. R. Gute was high on the ring target. Geo. Viemeister was second, and H. D. Muller third. In the contest on the bullseye target, F. Rolles got the best center shot and won the Muller prize. H. D. Muller was second.

Ten-shot scores, 25-ring target, distance 75ft.: R. Gute, 242, 243; Geo. Viemeister 233, 240; H. D. Muller 237, 236; C. Gerken 232, 234; F. Kost 229, 232; W. J. Daniel 232, 220; J. Von der Lieth 214, 237; Schillingmann 232, 219; J. Feldscher 238, 219; F. Schroeder 225, 225; J. N. F. Siebs 215, 234; F. Rolles 216, 229; Engelking 220, 224; Wm. Wessel 216, 221; Capt. C. Tietjen 214, 212; Speckmann 209, 200; H. A. Ficke, Jr., 194, 208; D. Scharninghaus 236, 235.

Bullseye target, 4in. carton, the best center shot to count by measurement: F. Rolles 33½ degrees, H. D. Muller 45, Geo. Viemeister 54, Fred Schroeder 54, R. Gute 71, D. Scharninghaus 73½, J. Feldscher 78.

#### Independent New York Corps.

THE second shoot of the winter series of the Independent Corps at the Zettler range, Feb. 19, brought out a larger number of members than has been seen at a practice shoot of the corps for the past five years. Capt. Gus Zimmermann, the newly elected executive, was highly delighted thereat. Nineteen members present took part in the shooting. Among the group were a number of new recruits, who had never shot on the range before. Captain Zimmermann gave them much intelligent assistance in how to hold the rifle and sight it. He set the pace and put up the highest score. First Shooting Master Lambert Schmidt was second.

Twenty shots, 25-ring target, possible 500; distance 75ft.: Gus Zimmermann 485, Lambert Schmidt 477, Aug. Begerow 473, Henry Koch 471, Wm. Söhl 463, E. Greiner 462, Geo. Zimmermann 459, Jac. Bittschier 459, F. Liezibel 450, Bruno Eusner 457, Jac. Schmidt 452, Henry J. Behrens 434, Herman Kuhn 434, Albert Rodler 418, Henry Kakinowski 413, F. C. Halbe 413, F. W. Wittig 392, J. G. Bauer 391, E. Gartner 381.

#### Zettler Rifle Club.

At the weekly shoot of the Zettler Club, Feb. 16, fifteen members took part in the struggle for high scores. Messrs. Tewes, Housen and Gute shot in good form and finished their scores in the order named. Several of the other members showed very erratic form. Louis C. Buss in particular shot poorly, his average for 50 shots being below the 240 average.

Ten-shot scores, 25-ring target, distance 75ft. 100 shots: W. A. Tewes 2449, L. P. Hansen 2439, R. Gute 2438, Major A. Rowland 2264.

Fifty shots: A. Kronsberg 1214, E. Van Zandt 1209, C. G. Zettler, Jr., 1202, Louis C. Buss 1199, C. G. Zettler, Sr., 1183, H. C. Zettler 1183, Aug. Begerow 1160, B. Zettler 1160, Thos. H. Keller, Sr., 1159, W. A. Hicks 1175, Geo. H. Wiegman 1132.

#### National Guard Items.

THE great festival in June will be open to teams of five men from each company of the National Guard of the several States and Territories.

The German Ambassador at Washington, Baron von Sternburg, has accepted the invitation of the bund to be present at the festival on June 16.

Judge Lorenz Zeller, president of the Harlem Ind. Corps, was appointed chairman of the reception committee. The judge is a good speaker both in German and English, and is well placed at the head of this committee.

The executive board of the bund, at its meeting last week, honored Gus Zimmermann by appointing him as referee of the festival.

#### New York City Corps.

THIRTEEN members were on the Zettler ranges for the regular shoot, Feb. 18. Aug. Kronsberg was high. O. Schwanermann was second.

Ten-shot scores, 25-ring target, distance 75ft.: Aug. Kronsberg 243, 243; O. Schwanermann 235, 245; Capt. R. Busse 235, 243; R. Bendler 235, 232; Chas. Wagner 232, 235; R. Schwanermann 220, 228; Chas. Schmidt 220, 220; F. Kelle 215, 222; H. C. Radloff 218, 218; G. Schrader 213, 217; E. Sonner 211, 212; J. Keller 205, 205; H. Vogel 193, 188.

#### Miller Rifle and Pistol Club.

TEN members of the Miller Club were present at the weekly shoot, 423 Washington street, Hoboken, Feb. 17. E. Doyle came to the front with the good score of 247. F. Unbehaum was second with 245.

Ten-shot scores, 25-ring target, distance 75ft.: E. Doyle 247, F. Unbehaum 245, C. Bischoff 244, D. Dingman 242, O. Smith 242, H. Bahn 238, C. Miller 236, R. A. Blake 232, R. A. Goldthwaite 233, H. Meynis 223.

#### Rifle Notes.

On Friday, Feb. 26, the New York Corps will hold its bi-monthly shoot on the Zettler ranges.

On Feb. 27, at 10 o'clock A. M., the annual gallery tournament—100-shot champion match—will be opened. It will close on Saturday, March 5, at 10 P. M. The prospects are that there will be a number of new candidates who will enter the list for honors and prizes. The shoot is open to all comers.

### PUBLISHERS' DEPARTMENT.

The Iver Johnson Arms and Cycle Works, of Fitchburg, Mass., makes bicycles, revolvers and single-barrel shotguns, all of high quality, and all well known to the trade and to the individual consumer. The company's motto, "Honest goods at honest prices," is an excellent one, and consumers may fitly be advised to investigate their product. While the company's manufactory is at Fitchburg, Mass., the New York office is 99 Chambers street.

Not a few of our readers will remember the beautiful picture entitled "On the Manistec," which was issued a year or two ago by the Pere Marquette R. R. A veteran angler seated on a log at the edge of the stream, was removing the fly from the jaw of a good-sized trout. The Pere Marquette Railroad covers a great area of fishing waters in Michigan, and Michigan waters are stocked every two years by the State with millions of trout fry, while in the lakes and larger rivers are renewed the supply of black bass and pike. Mr. H. F. Moeller, G. P. A., of Detroit, Mich., will send to applicants a booklet of information, giving details of the best fishing places to be found in the State.

## Trapshooting.

If you want your shoot to be announced here send a notice like the following:

### Fixtures.

March 9.—Guttenburg, N. J.—Second annual three-man team championship; 10 birds per man; \$15 per team. Gus Greiff, Mgr., 255 W. 111th street, New York.

March 12.—Bound Brook, N. J., Gun Club all-day merchandise shoot. Stanley Brampton, Sec'y.

March 22-25.—Crawfordsville, Ind., Gun Club's tournament.

April 6-7.—Bristol, Tenn.—The Interstate Association's tournament, under the auspices of the Bristol Gun Club. S. W. Rhea, Sec'y.

April 18-22.—Kansas City, Mo.—J. F. Schmelzer & Son's Arms Co. fourth Interstate midwinter shooting tournament; targets and live birds.

April 19.—Springfield, Mass., Shooting Club Patriots' Day tournament. C. L. Kites, Sec'y.

April 20-21.—Rensselaer (Ind.) Gun Club amateur tournament. Everette Brown, Mgr., Pleasant Grove, Ind.

April 21.—Easton, Pa.—The Independent Gun, Rifle and Pistol Club's first annual target tournament. Edw. F. Markley, Sec'y.

April 26-27.—Pittsburg, Pa.—Herron Hill Gun Club tournament. \$100 added. Louis Lautenslager, Mgr.

April 27-28.—Americus, Ga.—The Interstate Association's tournament, under the auspices of the Americus Gun Club. H. S. McCleskey, Sec'y.

May 3-4.—Wabash, Ind., Gun Club tournament.

May 4-5.—Nashville, Tenn.—The Interstate Association's tournament, under the auspices of the Cumberland Park Driving Club. Charles Eastman, Sec'y.

May 11-13.—Spirit Lake, Ia.—Iowa State Sportsmen's Association tournament. J. Burmister, Sec'y.

May 12-13.—Wilmington, Del.—Wawaset Gun Club annual spring tournament. W. W. Foord, Sec'y.

May 16-21.—York, Pa.—Tournament of Pennsylvania State Sportsmen's Association, under auspices of York City Gun Club. N. M. McSherry, Sec'y.

May 17-18.—Dallas, Tex.—The Interstate Association's tournament, under the auspices of the Dallas Gun Club. E. A. Mosely, Sec'y.

May 19-20.—Oklahoma City, O. T.—Territorial Sportsmen's Association's fifth annual tournament. J. C. Clark, Sec'y.

May 23-24.—Vicksburg, Miss., Gun Club two-day target tournament.

May 24-25.—Marshalltown, Ia., Gun Club two-day target tournament.

May 24-25.—Mt. Sterling, Ky.—Kentucky Trapshooters' League tournament. Frank Pragoft, Sec'y, Louisville, Ky.

June 7-9.—Sioux City, Ia.—Soo Gun Club's tenth annual amateur tournament; added money. W. F. Duncan, Sec'y.

June 8-10.—Huntington, W. Va.—West Virginia State shoot. F. H. Merrick, Sec'y.

June 14-17.—Warm Springs, Ga.—Target and live-bird tournament. Chas. L. Davis, Mgr.

June 21-24.—Indianapolis, Ind.—The Interstate Association's fifth Grand American Handicap at targets. One thousand dollars added to the purses. Elmer E. Shaner, Secretary-Manager, 219 Colbart Square, Pittsburg, Pa.

June 27-July 2.—French Lick Springs, Ind.—Tournament of the National Gun Club. \$500 added money. John M. Lilly, Pres., Indianapolis.

July 4-6.—Winona, Minn.—The Interstate Association's tournament, under the auspices of the Winona Sportsmen's Club. Oswald Leicht, Sec'y.

July 19-22.—Cincinnati, O., Gun Club annual handicap.

Aug. 10-12.—Brantford, Ont.—Dominion of Canada Trapshooting and Game Protective Association's fourth annual tournament. A. B. Cutcliffe, Sec'y.

Aug. 15-20.—Buffalo, N. Y.—New York State shoot.

## DRIVERS AND TWISTERS.

May 23 and 24 have been fixed upon for a two-day's target tournament by the Vicksburg, Miss., Gun Club, which is a member of the Mississippi Valley Trapshooters' and Game Protective Association.

The Montclair Golf Club and the Montclair Gun Club engaged in competition on Feb. 22 at Montclair, N. J., the former being a six-man team contest, 25 targets per man. The Gun Club administered second place to the Golf Club by a score of 81 to 69.

Messrs. H. S. Wells and Albert A. Schoverling sailed on the Hamburg-American S. S. Philadelphia, Feb. 20, for England, where they will tarry nearly two months. While in that land of excellent plum pudding, they will complete their final business arrangements for the American agency of a foreign made powder.

The schedule of the remaining regular contests of the Cleveland, O., Gun Club Company for 1904 is as follows: March 5 and 16; April 2 and 20; May 7 and 18; June 4 and 15; July 2 and 20; Aug. 6 and 17; Sept. 3 and 21; Oct. 1 and 19; Nov. 5 and 16; Dec. 3 and 21. Committees for 1904 are: House and Grounds, R. C. Hopkins, F. W. Judd and F. H. Wallace; Membership, W. C. Talmage, W. H. Boardman, F. J. Chapple. In the past year the club has erected a club house, manager's house, stable, shooting shed and two pits.

On Feb. 17 a match was shot at Outwater's shooting grounds, near Carlstadt, N. J., the conditions of which were 25 live birds, \$25 a side. The principals were Mr. Emil Steffens, of New York, and Count Lenone, of Paterson, N. J. The scores were 14 to 13, in favor of Mr. Steffens. The birds were a specially selected lot, and the bets were against any high scores, in view of the fact that the birds were so swift and vigorous. A return match has been fixed to take place on March 16. The conditions of the first match govern, excepting that the contestant making the lowest score pays for the birds.

The daily press recounts the death of Joseph Bennett. He died on Feb. 20, at his residence on Second street, in Brooklyn, N. Y. He was fifty-six years old. The recountal states that "Mr. Bennett became a clerk in the American Exchange National Bank in 1864, rising by successive steps to a position of responsibility and confidence. He was noted among his associates for his common sense, quick intelligence and genial, kindly nature. In his early life Mr. Bennett was one of the best field shots in this section, being one of the team of the Fountain Club when that club won the State championship. Mr. Bennett was a member of the Marine and Field Club and a trustee of the South Brooklyn Building and Loan Association. A widow and eight children survive him."

BERNARD WATERS.

### Firearms and the Fourth.

ARGUMENTS were heard for and against the use of certain firearms on July 4, by the Committee on Mercantile Affairs of the General Court, Boston, Mass., Feb. 18. Four bills were before the committee, and they were described in the Boston Evening Transcript as follows:

"House 555 is designed to link the prohibition of the sale of air-

guns to boys under sixteen years of age, with the prohibition of the sale of firearms; House 202 is the Emerson Union bill, which is designed to prohibit absolutely the granting of licenses for the sale of torpedoes, toy pistols, toy cannon, firecrackers and other articles containing explosives. Bills 464 and 465 are the bills of the Daughters of the American Revolution to stop the use of firecrackers over three inches in length, toy pistols, toy cannon, blank cartridges and firecrackers containing dynamite. The first bill, 555, was quickly disposed of, the petitioner, Thomas H. Hickey, alone appearing upon it. He said he wanted air-guns prohibited because his son had lost an eye through the use of such a gun. \* \* \* Samuel J. Elder, representing the United States Cartridge Co., the Union Metallic Cartridge Co., the Peters Cartridge Co., and the Winchester Repeating Arms Co., opened his remonstrance by providing the members of the committee with an assortment of cheap pistols used for firing blank cartridges. The committee received them when assured they were not loaded. Mr. Elder then went on to explain how poorly made pistols are dangerous, while the committeemen showed that they had had some experience in celebrating the Fourth of July by snapping the pistols and looking into the muzzles. He argued that blank cartridges ought not to be prohibited for the reason, that if toy pistols are prohibited, blank cartridges will not be dangerous. Moreover, if the boys do not have blank cartridges they will get ball cartridges, and loss of life is bound to follow. If blank cartridges are legislated against there can be no firing of salutes on the Common or by yachts in the harbor. Prohibition "on or about the Fourth of July" means nothing whatever, as would appear in any court. There is an element of pith to be considered, but every boy has to take danger into consideration in every sport. The boys brought up on our Fourth of July went out in '61 and '98.

Representative Barnes, of Weymouth said he had not been injured with fireworks and firecrackers.

The hearing was closed.

## ON LONG ISLAND.

### Goose Creek Gun Club.

Rackaway, L. I.—The shoot of the Goose Creek Gun Club on Feb. 14 had a light attendance. The scores follow:

Events:	1	2	3	Events:	1	2	3
Targets:	25	25	25	Targets:	25	25	25
Wohlmaier	15	11	..	Schleyer	..	13	..
Kelk	16	..	..	Rudolph	..	7	..
Steffens	13	17	..	Bowie	..	19	..
Lahey	14	..	..	Stachlin	..	10	..
Albert	18	9	..	Mayerhoff	..	12	..
Kreeb	..	5	..				

### Crescent Athletic Club.

Bay Ridge, L. I., Feb. 20.—Mr. L. C. Hopkins made a full score for the February cup, and thereby registered his third win for it. The scores:

February cup, 25 targets, handicap: L. C. Hopkins (3) 25, A. G. Southworth (1) 22, E. H. Lott (1) 20, H. L. O'Brien (4) 24, W. W. Marshall (5) 19, Capt. A. W. Money (1) 21, L. M. Palmer (1) 24, O. C. Grinnell, Jr., (5) 18, F. B. Stephenson (1) 17.

Sykes' cup, team shoot, 25 targets: L. C. Hopkins (3) 20, Capt. Money (1) 22; total 42. W. W. Marshall (5) 25, A. G. Southworth (1) 22; total 47. E. H. Lott (1) 22, H. B. Vanderveer (3) 24; total 46.

Trophy shoot, 15 targets: W. W. Marshall (3) 12, A. G. Southworth (0) 12, F. B. Stephenson (0) 11, E. H. Lott (0) 13, O. C. Grinnell (3) 8, L. M. Palmer (0) 11, H. B. Vanderveer (1) 12, L. C. Hopkins (1) 14, C. J. McDermott (4) 13, H. L. O'Brien (2) 10, G. Notman (1) 13, Capt. Money (0) 12. Won by Hopkins.

Trophy match 15 targets: W. W. Marshall (3) 15, A. G. Southworth (0) 9, F. B. Stephenson (0) 11, E. H. Lott (0) 12, O. C. Grinnell (3) 12, L. M. Palmer (0) 12, H. B. Vanderveer (1) 12, L. C. Hopkins (1) 11, C. J. McDermott (4) 13, H. L. O'Brien (2) 12, Capt. A. W. Money (0) 11, G. Notman (1) 8. Won by Marshall.

Trophy match, 15 targets: A. G. Notman (1) 10, H. L. O'Brien (2) 15, O. C. Grinnell (3) 9, A. G. Southworth (0) 11, L. M. Palmer (0) 12, F. B. Stephenson (0) 12, E. H. Lott (0) 10, L. C. Hopkins (1) 12, W. Sherer, Jr. (4) 10, W. W. Marshall (3) 14, H. B. Vanderveer (1) 13, Capt. Money (0) 12, T. W. Stake (2) 11.

Palmer trophy, 25 targets: F. B. Stephenson (1) 22, E. H. Lott (1) 20, Capt. A. W. Money (1) 25, L. M. Palmer (1) 22.

Trophy match, 15 targets: G. Notman (1) 11, H. L. O'Brien (2) 15, O. C. Grinnell (3) 10, A. G. Southworth (0) 13, C. J. McDermott (4) 13, L. M. Palmer (0) 13, S. C. Hopkins (1) 14, E. H. Lott (0) 9, F. B. Stephenson (0) 12, W. Sherer (4) 13, W. W. Marshall (3) 11, H. B. Vanderveer (1) 11, Capt. Money (0) 15, T. W. Stake (2) 14.

Shoot-off: O'Brien 15, Capt. Money 13.

Team shoot, 10 targets:

L. M. Palmer 9, F. B. Stephenson 8, A. G. Southworth 8, L. C. Hopkins 5, W. W. Marshall 7, H. L. O'Brien 9, W. Sherer 5; total 51.

E. H. Lott 8, Capt. Money 9, G. Notman 7, H. B. Vanderveer 7, C. J. McDermott 5, O. C. Grinnell 8, T. W. Stake 7; total 51.

On toss of a coin, Palmer's team won.

Trophy match, 15 targets: H. L. O'Brien (2) 12, T. W. Stake (2) 12, L. C. Hopkins (1) 13, O. C. Grinnell, Jr. (3) 11, G. Notman (1) 12, Capt. A. W. Money (0) 12, W. Sherer, Jr. (4) 14. Won by W. Sherer, Jr.

### A Southern Squad.

NEW ORLEANS, Feb. 14.—In spite of the excitement occasioned by the Mardi Gras, the U. M. C. Southern Squad received a warm ovation. The many courtesies extended by the gun club members and other friends of the "old-timers" made it evident that it was "up to them to make good."

Frank Riehl delighted the large crowd by running 86 straight just to prove some of the stories that had come out in the newspapers as to what he could do. He was high man for the day with a score of 98 out of 100. The other men were not far behind. Each man shot at 100 targets. The scores: Capt. Marshall 91, R. O. Heikes 95, J. T. Anthony 83, W. H. Heer 94, F. C. Riehl 98.

This is remarkable work, considering the fast rate the men are traveling, and also that they are shooting every day. CREOLE.

BATON ROUGE, Miss., Feb. 16.—The U. M. C. Southern Squad gave an exhibition shoot here to-day which was attended by a large and enthusiastic crowd. While none of the cracks were at all anxious to break any records, they made it very apparent that they were far from being raw recruits. Baton Rouge sportsmen will be more than glad to entertain the squad whenever it tours the South again. In fact, so much enthusiasm was aroused that a gun club of about 15 members will soon be organized. The score follows: T. A. Marshall 91, R. O. Heikes 94, C. W. Budd 89, J. T. Anthony 89, F. C. Riehl 94. NIBBS.

## IN NEW JERSEY.

### New York German Gun Club.

Carlstadt, N. J., Feb. 17.—As to the match between Count Lenone and Mr. E. Steffens, the score sheet was destroyed by the Count, as the scores were too low; but the birds were the best I have ever seen trapped. Mr. Outwater had his money bet on the number of kills; namely, that either one would not kill 20 birds. The score was: Count Lenone 13 out of 25; Emil Steffens 14 out of 25.

The match was made over again, 25 birds, \$25, lowest score to pay for the birds. The match is to be shot on March 16, the date of the next shoot of the New York German Gun Club. The scores:

Count Lenone	11	0010	3	Lempe, 25	00	1200	2
E Von Kattengell	11	0112	4	Zenner, 25	00	0000	0
J Schlicht, 28	20	1211	5	J P Dannefeler, 28	22	2022	5
J H Block, 28	01	0201	3	J F Wellbrock, 28	02	2020	3
E Steffens, 29	00	1211	4	H Meyn, 25	20	1200	3
A E Hendricksen, 28	02	2011	5	P Albert, 28	11	0011	4
P Garms, 28	21	0011	5	Kruger, 30	11	0211	5
Exemer, 25	00	1001	2	Ludening, 28	10	0120	3
H Mesloh, 28	00	1010	3				

\*Guest.

The club shoot is at 10 birds, but as there was a shortage of birds, this shoot was, perforce, limited to 7.

### Montclair Gun Club.

Montclair, N. J., Feb. 20.—Messrs. N. Apgar and J. S. Fanning were visitors. The scores:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13	14
Apgar	7	10	8	13	10	13	8	12	6	8	6	14	9	13
Fanning	8	14	10	15	10	14	10	14	9	14	10	14	8	15
Kendall	6	7	8	10	4	9	8	10	5	8	..	..	..	..
Moffett	4	8	5	11	6	11	8	14	9	13	6	11	5	11
Matthews	..	..	..	..	..	..	..	..	..	..	..	..	..	..
Cockefair	..	..	..	..	..	..	..	..	..	..	..	..	..	..
Wheeler	..	..	..	..	..	..	..	..	..	..	..	..	..	..
Benson	..	..	..	..	..	..	..	..	..	..	..	..	..	..
Crane	6	10	6	10	6	8	..	..	..	..	..	..	..	..

### Franklin Gun Club.

Franklin Furnace, N. J., Feb. 20.—At the shoot of the Franklin Gun Club to-day, shooting at 28 targets, John Williams broke 11, and Ander Wright broke 20. Fred Southerd broke 17 out of 30. Frank Kishpaugh broke 13 out of 25. Alf Wright broke 11 out of 17. Will Stephens broke 4 out of 12. Elmer Black broke 2 out of 11. FRANK KISHPAUGH, Sec'y.

### Poughkeepsie Gun Club.

POUGHKEEPSIE, N. Y., Feb. 18.—Eight men faced the score at the weekly shoot of this club to-day. As usual, the cup event was the principal one of the day. In the preliminary events several straight scores were made. The temperature, however, was such as to forbid steady shooting, the cold being very intense. In the cup event, while Smith was high gun, Winans carried off the honors by defeating Smith in event 5, which answered as a shoot-off of their tie in the cup event proper.

This cup must be won six times to acquire ownership, and as Smith had already scored four wins to his nearest competitor's two, to have won it to-day would have made somewhat of a cinch for him, and, with this in mind, perhaps, it added to Pat's unsteadiness in the shoot-off.

Capt. Traver won the shoot-off of his tie with T. Rhoades, carried over from last week. Scores follow:

SNANIWEH.

### New York Athletic Club.

TRAVERS ISLAND, Feb. 20.—The regular club shoot of the New York Athletic Club took place to-day. Mr. King, who had won the Elias trophy a week ago, was again victorious and won for good. The main event, Elias trophy, 50 targets, handicap, follows:

	Brk.	Hdcp.	Tot'l.		Brk.	Hdcp.	Tot'l.
Stripler .....	23	18	41	Miller .....	21	0	21
King .....	25	18	43	Kidd .....	28	0	28
Greiff .....	32	5	37				

Sweepstakes, at 25 targets:

Miller	15	13	16	11	10	16	Kidd	..	..	..	..	..	..
King	11	..	..	..	13	12							

Feb. 22.—Mr. F. Perkins surprised the other members with his good shooting. He had won the holiday cup before, and again captured it to-day. This trophy has to be won three times to become the property of a contestant. There was a very small attendance on account of the rainy morning, but the few on hand had an enjoyable afternoon. The main event, holiday cup, 50 targets, handicap, had scores as follows:

Brk. Hdcp. Tot'l.			Brk. Hdcp. Tot'l.		
Greiff .....	37	7 44	Perkins .....	34	15 49

### Independent Gun, Rifle and Pistol Club.

EASTON, Pa., Feb. 16.—At the weekly practice shoot of the Independent Gun, Rifle and Pistol Club, of this city, the following scores were made:

Shot at. Broke.		Shot at. Broke.	
H Brunner.....	100 67	J Young .....	50 21
O Skeds .....	100 71	L A. Francisco.....	100 41
R Young .....	50 25		

At this time we are pleased to state that in our scores last sent you of our monthly shoot, the score of J. E. Frederick should have been 161 breaks out of 190, instead of 140 out of 190.

More interest is now already being taken by the members of the club than ever before, in their first tournament, and we all are looking forward to this event with great prospects of a very successful tournament. E. F. MARKLEY, Sec'y.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

## The Grand Prix du Casino.

MONTE CARLO, Feb. 1.—The Grand Prix was opened to-day in splendid weather, a good light and a nice breeze adding much to the enjoyment of both shooters and spectators. The entry was very encouraging compared with last year, there being a total of 153, of whom no fewer than 58 were Italians. The birds, supplied by Roberts, were of first-class quality, as may be imagined when it is observed that in the opening round 50 shooters, at 26 metres, missed, and strange to say, the same number failed in the second round, while among the 23 that missed both were included Count O'Brien and M. Guyot, respectively winners in 1900-01. Among those who experienced bad luck during the day were M. Journu, Lord Savile, Mr. Mackintosh and Mr. Percy Thellusson, the two latter of whose second birds, hard hit, struggled outside before dropping. Mr. J. H. Roberts and Mr. Le Pellier-Johnson, as former winners of the great prize, were put back one and two metres respectively, and killed their two birds, along with Mr. Watson, Mr. Carroll, Mr. Spalding, Mr. Asplen, Mr. Hodgson, Mr. V. Barker, Mr. Hall, Mr. Haydon, Mr. Collier, Mr. Ker, Mr. Hayes, Mr. Harrison and Mr. F. Thellusson.

Feb. 2.—A tropical rain set in to-day, with the result that a postponement became absolutely necessary after the third round had been disposed of. Such heavy rain, in fact, is very seldom seen in Europe, and the situation may be guessed from the circumstance that the birds were positively unable to fly, while the men in charge of them went on strike, declining to take them to the traps.

Feb. 3.—The deluge of yesterday was to-day changed to sunshine, a gentle breeze, and an excellent light, though there was a cloudy sky. The birds were everything that could be desired in the way of testing the skill of the best shooters, and in the fifth round especially the guns had all the worst of it. The following at the end of the seventh round had killed all their birds: Signor Brocco, Mr. Watson, Mr. Hodgson, Mr. Menton, the Marquis Villaviciosa, Mr. Demonts, Signor Fortunio, Signor Pistoletti, Signor Galetti, Signor Schianini, and Signor Giungo, and there were 43 who had a single miss to join those just detailed, those with two misses now retiring.

Feb. 4.—The competition came to a close, and again the weather was charming, with a southeast breeze. The pigeons were, if anything, better than on either of the previous days, in which connection it is but fair to say that some of the English guns had the worst of luck, Mr. Roberts especially being a victim. The eighth round saw the whole of the eleven who remained in last night with clean sheets again successful. In the next round, however, Signor Fortunio was defeated by a strong and difficult bird, like ill-fortune attending Signor Villaviciosa, Signor Giungo and Mr. Hodgson with the opening of the tenth round. Signor Braco, Mr. Watson, M. Demonts, Mr. Merton, and Signor Schianini were still without a miss, but a strong bird, assisted by the wind, stopped Signor Braco. Mr. Watson distinguished himself by bringing down his bird on the edge of the boundary fence with the second barrel. M. Demonts and Mr. Merton having killed, it only remained for the Italian, Signor Schianini, to drop an easy bird to finish the round. The contest was now nearing a conclusion, when in the eleventh round, Mr. Merton and M. Demonts missed, which left Mr. Watson and Signor Schianini to fight it out; but the twelfth round proved the final, so far as the first prize is concerned. The Englishman got what appeared to be anything but a difficult bird; all the same, he failed, through apparent nervousness, to stop it, and it consequently only remained for the Italian champion to kill. This he accomplished with an easy bird, thereby grassing a dozen in succession, and it goes without saying that Signor Schianini's success was extremely popular, when it is remembered that two years ago, when his countryman, Signor Grasselli, was the victor, he divided third and fourth prizes with Count O'Brien. No fewer than fourteen shot off for the second, third and fourth prizes, which finally were divided by Signor Villaviciosa, Baron de Tavernost, and M. de Gilles. Scores:

Grand Prix du Casino of 8 sovs. each, with 800 added to a work of art; second, 160 sovs. and 25 per cent. of the entrance; third, 80 sovs. and 20 per cent.; fourth, 40 sovs. and 15 per cent.; balance to the winner; 12 birds—3 at 26 metres, 9 at 27 metres; last year's winner stands back 2 metres; previous winners 1 metre; 153 subscribers:

Signor Schianini (first of £1029 and trophy).....	13
Signor Villaviciosa (divided £1018).....	14 out of 15

1904.....Signor Schianini.....	Italy

—Field (London).

After a few weeks' competition for ordinary prizes, the Monte Carlo fortnight began on Monday of last week, continuing over this, which has seen the decision of the Grand Prix and a number of other valuable trophies.

The weather at Monte Carlo in the beginning of last week was lovely; but we learn from our correspondent there that the sun was so strong that the glare was very dazzling to the gunners, especially to the visiting members of the English gun clubs. They felt the change from the weather here to that of Monte Carlo, where the sun poured down on the rippling sea in front of the club enclosure, trying the eyes of all very severely, so much so, that many of the Italian division wore yellow glasses to protect their eyesight from the glare.

The birds were fairly good, but rather mixed, not so fast, on the whole, as those lately supplied at the London Gun Club. A few of them, however, were very fast, and when these birds went off from the middle trap they wanted very straight shooting to stop them within the boundary. Many of them, hard hit, dropped dead just outside the limit, carried there solely by the wind. There were also a surprising number of incoming birds throughout the fortnight, which, though easily killed, were just as easily missed. It looked as if these birds did not care to face a journey out to sea.

The feature of last week on the Monte Carlo grounds was the brilliant shooting of the Hon. Percy T. Thellusson, which almost daily succeeded in gaining the admiration of the onlookers. On Monday of last week Mr. Thellusson was lucky in killing many of his birds right on the boundary, and in seeing none of them fall beyond it. But on Thursday he won the gold medal, the trophy of the week, the 3,000 franc prize, by killing nearly all his birds with his first barrel, though finally winning with a magnificent second at a fast bird from the left corner trap that went away to the left like the wind. He dropped it within 3yds. of the boundary of 17yds., so much nearer than at the London Gun Club, which is 30. Mr. Thellusson used a Boss gun and American Schultze powder.

The variety of the ammunition used was a study, many of the Italians and Frenchmen loading their own cartridges. For this purpose one Italian competitor carried with him a kind of wedge and turn-over combined, and his struggles with his machine to prevent the slightest shake in the pellets must almost have pushed the shot through the wads. The guns also were a very mixed lot, the fancy gold work on some of them being a violation of English taste, especially where the ovals on the stocks recorded the dates of previous wins. Many of the barrels, again, on the Continental guns were very long, some of them about 34in.

The first round for the Grand Prix began on Monday last in lovely weather. At the start the sun was strong, and with the slight breeze the birds flew well. The competitors numbered 151, as against 130 last year, a record number which was increased later on by the late arrival of two Italians, raising the entry to 153. The wind dropped soon after the first round, and then the birds were easier ones. The birds trapped were in excellent, but not exceptional condition. Nearly half of the competitors were Italian, the English contingent numbering just over a score. Only two rounds were called for on the opening day, and at the second round the two favorites, Mr. P. Thellusson and Mr. Mackintosh,

missed their birds, as did also such well-known shots as Lord Savile, Hon. Fitz Roy Erskine, M. Journu, M. Grasselli and De Gilles.

On Tuesday rain prevailed so continuously that after the first round the committee postponed proceedings for a day, when fifty-seven competitors had killed three birds out of three and fifty-four two out of two.

On Wednesday the weather was splendid, neither sun nor wind being strong. The birds, too, were very fast, and only twenty-seven competitors who had killed all their birds remained at the end of the sixth round, while at the conclusion of the seventh the ranks were further thinned out. The Italians shot well, and at the end of the day's shooting five of them had succeeded in killing all their birds, while Spain, France, and Australia were each represented only by one competitor, who had equaled this score, the Englishmen who had not missed being Messrs. Braco, Watson and Hodgson.

There was some very good shooting on Thursday, and great excitement prevailed, when after the eleventh round, the issue lay between Mr. Watson and the Italian, Signor Schianini. The Englishman shot first, and expressions of regret were heard on almost every side when he missed an apparently not very difficult bird. Then Signor Schianini had an easy bird, and made no mistake, being proclaimed the winner of the Grand Prix. Thus he added another victory to the nine claimed by Italy against twelve by England. Finally the 24,442 francs reserved for second, third and fourth were divided between Villaviciosa, Tavernost and Gilles, each killing 14 out of 15. The Englishmen were not favored by the birds.—County Gentleman.

## The Cleveland Gun Club Company.

CLEVELAND, O., Feb. 16.—Herewith please find data which refers to this club. We submit same, as it is possible that some of this data will be interesting to your readers. We beg to call special attention to the rules which we have adopted to govern club contests for year 1904. The writer has had twenty-two years' experience in connection with target shooting, and his experience indicates that the rules to govern the contests of a club are very hard to formulate if entire satisfaction is to be given every member of a club. You will notice that the enclosed rules provide for a self-imposed classification. We believe that this is the only equitable plan to adopt for club contests. We have tried all kinds of rules, and we find that any arbitrary handicap does not meet with the approval of all our members. We have held three contests which were governed by the enclosed rules, and up to date, our members are very much pleased with the result.

The thought has occurred to us that these rules will interest many of the gun clubs of this country, as the same are the result of years of thought to perfect, and furnish a satisfactory basis for competition in our club. You will note that the enclosed forms indicate that we have established a permanent shooting park, which should furnish a home for our club for any number of years in the future. Our land is 900ft. wide and 2,000ft. long, and while it is located twelve miles from the center of our city, it can be reached by suburban cars within an hour. After twenty-two years of existence upon different shooting grounds, we have finally secured what the older members have long desired, viz.: a place where we cannot be disturbed by any procedure whatsoever. Our membership has been greatly increased during the past two months, and we expect that we shall have at least 300 members in good standing by Jan. 1, 1905. Our membership is made up of the first business and professional men of this city, and it has been our policy to keep the initiation fee down to \$10 and the dues to \$5 per year, so that any gentlemen, irrespective of his financial worth, can take part in the delightful pastime of trapshooting.

T. G. HOGAN, Pres.

### Rules for Club Contests.

1. Semi-monthly contests shall be held at the club's shooting park on the first Saturday and the third Wednesday of each month, at an hour to be announced by the board of directors, and notice shall be published one day in advance of each contest in two of the daily papers of Cleveland.

2. Each contest shall consist of 40 targets, known traps, unknown angles; entrance, targets included, shall be 50 cents.

3. The members of the club shall be divided into A, B, C, and D classes. A-Class shall be composed of members who shoot 85 per cent., or above; B-Class, 75 to 85 per cent.; C-Class, 65 to 75 per cent., and D-Class, under 65 per cent.

Every member's class, in a semi-monthly club contest, shall be fixed by the percentage he made in the last contest in which he participated. This rule provides for a self-imposed classification, which is absolutely equitable, and it should be satisfactory to all the members of this club.

4. This club shall furnish a blue ribbon for first prize, and a red ribbon for second prize, for each class, in every regular semi-

The price of all practice targets during the year, except on special tournament days, shall be 1¼ cents each.

First of all, I take two guns having what I should term billiard-cue balance, the first being a single 10 bore, with a 32in. barrel, weighing 6lbs. 14oz., of which 3lbs. 2oz. is contributed by the barrel, 6oz. by the fore end, and 3 lbs. 6oz. by the stock. When put together the gun balances at 13 $\frac{1}{2}$ in. from the breech, and when suspended as I have described at two points, one of which I will take as standard at 7in. from the breech, each hand if found to be carrying equal weights, namely, 3lbs. 7oz. This point, 7in. from the breech, may be taken as representing the average position of the hand when grasping the fore end. The second gun is

Now, it is easy to see what is the difficulty about reducing the action of a light double gun of wide caliber; for, when one barrel of a double gun is fired, the strain is not simply that which is developed in a single gun, or in a double one when both barrels are fired together. In the latter case the strain is symmetrical, and resisted by the whole breadth of the action and bolts; but in the former, through the unsymmetrical position of the cartridge, a sideways strain is produced, which, combined with that upward and forward, results in a torsional stress very trying to the gun. We accordingly find the burst barrel twisted off the lump, or the side of the action fractured by the leverage of the bolts, and such a strain is very fairly imitated by placing a gun with one or other lock plate in front of the knee, and pretending to break the gun with the hands like a stick. It will be seen how very little strength

Here, then, is the right indication for the employment of small-bore guns as serious weapons. They should not be much lighter than 12-bore guns, but will differ from them advantageously in balance, and their loading on correct principles will proceed on the plan of taking the standard ounce of shot as a basis, and working back from this to the requisite charge of powder. Such weapons are no novelty, and are fundamentally rightly designed, and though the strains produced in them are often severe, they do not suffer if of good construction. But to go on trying to use nitro powders safely in light guns of wide caliber seems to me as futile as trying to make a Snider rifle safe with cordite. Here, however, we get away from the question of balancing guns.—J. B. Nias in *Field* (London).

The Baker Gun and Forging Co., Batavia, N. Y., inform us that they have secured the services of Mr. W. H. More for their sales department.

**BATAVIA, N. Y.**

Is operated through from New York to St. Augustine, with the exception of one Double Drawing and Stateroom Sleeping Car, which is operated to Aiken and Augusta, Ga. The train is composed of Pullman Compartment Cars,

Though the winter has been hard and long, the angler begins now to smell in the frosty air some foretaste of spring, and to get out his tackle, so that when the season for fishing comes he will be prepared to start. A large number of our readers make their annual angling tours to Michigan, to have their share in the bass and trout fishing there, which is reached by the Detroit & Mackinac Railroad. Mr. J. D. Hawks, of the Majestic Building, Detroit, Mich., will send matter descriptive of the fishing localities reached by his line on application.

### THE CHANGING YEAR.

THE calendar tells us that winter is past and gone, but as yet we see few signs of spring. But surely it is time that it should be here, for all along the Atlantic seaboard north and south, and as far west as the Missouri River, the winter has been bitter and long and hard. The January thaw so confidently looked for each year has come in but few places, and the unfortunate ground hog which put his head out of his hole on February 2 saw his shadow clearly defined on the ground beside him, and very likely lost the fringe of his ears by the cold that then prevailed.

We have heard many angry threats against the person of him—if he could be found—who first suggested that St. Valentine's day was the beginning of spring, and up to the very last day of February of this year there were no signs that winter would let go his hold. In many sections of the West, on the other hand, the early part of the winter was unusually mild and pleasant. In Nebraska it was more like summer than winter, while in Montana, up to the beginning of February at least, there was no real winter, and the cattle remained fat and strong.

On the birds throughout the depleted covers of the northeast this has been a hard winter. What has happened to the ruffed grouse we do not know, but frequent reports as to the quail tell of widespread destruction among these favorite game birds. In many localities efforts were made to feed the coveys, but too often the danger was not realized until too late, and the birds perished before they found the food intended for them. Nor were the upland birds the only ones to suffer. At many points along the coast this has been a hard winter for the wildfowl, and not a few of them are believed to have starved to death. This condition of things is not very unusual in hard winters. Singular as it may appear, there are many ducks wintering along our coasts, which, for some reason or other, will not go further south. They remain here—withstanding that the ice floes cover their feeding grounds, and make it impossible for them to procure subsistence—and here they stay and starve and starve, until finally they must perish. Why the black ducks and the scoters and the broadbills do not go south with others of their kind we do not know, but many of them remain here to face death. It is reported that at present at many points along the coast ducks are starving to death.

What the result will be of this past hard winter on shooting, we cannot yet know, but in many places, notably in New England, New York, and Pennsylvania, the worst may be feared. Moreover, it is becoming more and more difficult every year to restock those covers from which the birds have been swept away by the wholesale. State laws make the procuring of birds for stocking very difficult, and persons owning or controlling tracts of land on which the birds have been destroyed, hardly know which way to turn.

ONE thing leads to another; when a discussion is started there is never any telling where it will end. Something was written here the other day about the coincidences of everyday life, the things which "just happen so," in such conjunction one with another as to make us remark them; and this has led away into the fields of the occult and the supernatural—a realm which is, perhaps, outside the scope of FOREST AND STREAM. But in all the records of personal experience which have had chronicle in these pages, we recall nothing more unique or more interesting than our old soldier contributor Caba Blanco's statement of why he has gone into battle always with the confidence that he would come out alive.

### A Scheme of Game Restoration.

WE noted last week that the Massachusetts Association for the Protection of Fish and Game proposed to restock some of the covers of the State in which the quail have been exterminated by the severity of the winter. The publication of this intention brought to the officers applications in numbers which surprised them. These were not requests for donations of birds, but were subscriptions to defray the cost and the expenses. The incident demonstrates not only the growth of interest in shooting, but an acceptance on the part of shooters of the principle that if they would have shooting, they must look out for it and provide it. In many parts of the country the day of a happy-go-lucky attitude toward the game supply has gone by. Over-shooting, hard winters, the fluctuations of supply due to natural causes which are not understood but are recognized as in operation, these conditions have set the sportsman thinking, and his thought has resolved itself into the conviction that he must supplement nature by making artificial provision for a renewed stock. In the Northern and more densely populated States this is the tendency of the time.

The problem is one of a source of supply.

There are three ways in which a supply of quail might be secured. Two of them are practicable and readily to be put into operation; the third awaits discovery and exploitation.

The first way is the transplanting of quail from the districts of over-supply in certain States to those of scarcity in other States. The law in States where quail are abundant now forbids netting or trapping or export. It is a good law, and, as a rule, a highly necessary one. But there are States in which the law might very reasonably be modified to the extent of authorizing the taking alive of birds by agents under the supervision of the game commissioner or his deputies, for the purpose of exportation for stocking grounds in other States, where the birds should be put out under the supervision of the game commission of the State into which they are received. By providing thus for official control at both ends of the line, the enterprise could be restricted to its legitimate field quite as readily and effectively as is the interchange of fish now carried on between the several States. With the machinery properly devised there need be not the slightest apprehension that crates of live birds shipped ostensibly for stocking purposes would be underground railroaded to market. Every shipment could be registered and receipted for from the hour of capture to the hour of release.

Nor need any source of supply be unduly drawn on, so that local covers would be depleted. The extent of the taking for export, with a maximum limit fixed by law, could be made discretionary with the game authorities. The prices received for the birds (quail are now worth from \$3 to \$10 per dozen at the point of shipment) would be a sufficient inducement to secure them, leaving a substantial remuneration to the catchers after the official fees had been deducted.

There are such sources of live game supply practically inexhaustible, and amply sufficient to meet all the demands upon them for shooting purposes, if only the FOREST AND STREAM's Platform Plank—"The sale of game should be forbidden at all seasons"—were put into operation with respect to dead game.

Stop the sale of dead game, and the sale of live game under official control might be efficient to stock the covers of the country and keep them stocked.

Why is not this a reasonable and desirable system? Are not the advantages so great as to outweigh any ob-

jections that may be brought against it? Why should not the system be put into operation?

Another plan—the second one referred to—would provide for the supply of game birds by the National Government. Congress now distributes millions of packages of seed to the farmers in the country and women window gardeners in town, and sends out annually millions of fish eggs and fish fry. Why should it not take up the enterprise of distributing live game where it is needed, and where anon it might perch on the top rail of political fences which its advent had helped to mend?

That the distribution of fish to the streams is within the province of the National Government is a proposition now beyond debate; the thing has been done for a quarter-century and has been accepted as a national policy. The proposition to distribute game to the fields runs on all fours with it. Congress has already made a certain vague provision for game stocking by enacting in the Lacey Act:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the duties and powers of the Department of Agriculture are hereby enlarged so as to include the preservation, distribution, introduction and restoration of game birds and other wild birds. The Secretary of Agriculture is hereby authorized to adopt such measures as may be necessary to carry out the purposes of this act, and to purchase such game birds and other wild birds as may be required therefor, subject, however, to the laws of the various States and Territories. The object and purpose of this act is to aid in the restoration of such birds in those parts of the United States adapted thereto, where the same have become scarce or extinct, and also to regulate the introduction of American or foreign birds or animals in localities where they have not heretofore existed.

This is very good so far as it goes; but it does not go far enough; nothing practical in the way of restocking has come of it. No birds have been imported or transported by the agents of the department. Their sole activities in this field have been directed to the suppressing of the shipment of birds from the Indian Territory to eastern game grounds.

Now, the Government possesses in its territorial lands quail breeding districts which might be set apart as reservations for the production of a constant supply of breeding birds to be distributed by Government allotment to the covers of the several States.

In one of these two ways, State initiative and control, or National, or both, the game supply of this country might be so administered as to effect the greatest good to the greatest number. The subject is one which may well have consideration and discussion and trial.

The third way alluded to above is the domestication and breeding of quail for stocking purposes. This may be an achievement of the future. There is no reason to believe that it will be done soon. For all practical purposes it may be dismissed as a dream.

### TWO PICTURES.

THE two pictures of the supplement this week, showing the Ocklawaha River of Florida and Chief Mountain in Montana, admirably illustrate in their contrast the wonderfully diverse phases of natural scenery our country possesses. One picture is of the Northwest with its snow-capped mountain ranges; the other of the South, with its sluggish waters and tangled vegetation. Each has its own alluring charms. No one who has camped beneath the mighty mass of a Rocky Mountain peak can ever forget the uplift of spirit that came to him as the light of dawn kissed the lofty summits. The brightest day of Florida's golden sunshine will not at once resolve the weird spell which is cast upon one who makes that night descent of the Ocklawaha, when the pine knot flare lights up the spectre cypresses, and but half reveals the dreamland mazes of mystery and gloom stretching away upon either hand.

## Trails of the Pathfinders.

### II.—Alexander Henry.

THE fur trade, which occupied many worthy men during the eighteenth and first half of the nineteenth century, forms a romantic and interesting part of the early history of our country.

The traders, usually of English and American parentage, associated themselves with the French voyageurs, or *coureurs des bois*, whom Masson describes as "those heroes of the prairie and forest, regular mixture of good and evil, extravagant by nature, at the same time grave and gay, cruel and compassionate; as credulous as superstitious, and always irreligious." Traders and voyageurs alike were men who braved the cold of winter, the hot sun of summer, who suffered every privation, and who beat out the unknown path of discovery during all seasons, until it became a well-worn trail; all to penetrate the great unknown, which might contain everything that the trader desired. The man who lived in those times, and under those conditions, was brave and enduring without trying to be; he was alert and quick to act, and unwearied in overcoming obstacles. Viewing him from the present day, we might call him cruel and without feeling; but in those times men were taught not to show their feelings. Their lives were given in great part to surmounting enormous difficulties of travel in unknown regions, and to establishing trade relations with unknown tribes of Indians, who were oftentimes not disposed to be friendly. The fur trader was in constant danger, not only from hostile Indians, but often from lack of food.

Alexander Henry was one of these fur traders. He came upon the scene just at the close of the French regime. At twenty-one he had joined Amherst's army, not as a soldier, but in "a premature attempt to share in the fur trade of Canada, directly on the conquest of the country. Wolfe's victory at Quebec in the previous year had aroused the English traders to the opportunity presented of taking over the fur trade which the French had opened up, and Amherst's large army was watched with great interest as it swept away the last remnant of French control. Henry was well fitted for the life that he intended to pursue, as he seems to have had knowledge of the trading posts of Albany and New York.

On the 3d day of August, 1761, Henry despatched his canoes from Montreal to Lachine on an expedition to the regions west of the Great Lakes. Little did he realize then that he should be gone from civilization for sixteen years; that he should suffer and want but survive; should see new and strange peoples, discover rivers and lakes, build forts, to be used by others who were to follow him, trade with the natives, and finally return to hear of the capture of Quebec by the Americans, and then go to France to tell of his adventures. The route of the expedition was the usual one. Almost immediately after leaving Lachine they came to the broad stretch of Lake Saint Louis. At St. Anne the men used to go to confession, as the voyageurs were almost all Catholics, and at the same time offered up their vows; "for the Saint from which this parish derives its name, and to whom its church is dedicated, is the patroness of the Canadians in all their travels by water." "There is still a further custom to be observed on arriving at St. Anne's," Henry relates, "which is that of distributing eight gallons of rum to each canoe for consumption during the voyage; nor is it less according to custom to drink the whole of this liquor upon the spot. The saint, therefore, and the priest were no sooner dismissed than a scene of intoxication began in which my men surpassed, if possible, the drunken Indian in singing, fighting, and the display of savage gesture and conceit."

Continuing up the river, passing amid beautiful scenes, and carrying over many portages, they at last reached the Ottawa, and soon ascended the Mattawa. Hitherto the French were the only white men that had been known in this region. Their relations with the Indians were friendly, and the Indians were well aware of the enmity existing between the French and the English. In the Lac des Chats Henry met several canoes of Indians returning from their winter hunt. They recognized him as an Englishman, and cautioned him, declaring that the upper Indians would kill him when they saw him, and remarked the Englishmen were crazy to go so far after beaver. The expedition came at last to Lake Huron, which "lay stretched across our horizon like an ocean." It was, perhaps, the largest water Henry had yet seen, and the prospect was alarming, but the canoes rode with the ease of a sea bird, and his fears subsided. Coming to the island called La Cloche, because "there is here a rock standing on a plain, which, being struck, rings like a bell," he found Indians, with whom he traded, and to whom he gave some rum, and who, recognizing him as an Englishman, told his men that the Indians at Michilimackinac would certainly kill him. On the advice of his friend Campion, Henry changed his garb, assuming the dress usually worn by the Canadians, and, smearing his face with dirt and grease, believed himself thoroughly disguised.

Passing the mouth of the river Missisaki, he found the

Indians inhabiting the north side of Lake Superior cultivating corn in small quantities.

As he went on, the lake before him to the westward seemed to become less and less broad, and at last he could see the high back of the island of Michilimackinac, commonly interpreted to mean the great turtle. He found here a large village of Chippewas, and leaving as soon as possible, pushed on about two leagues further to the fort, where there was a stockade of thirty houses and a church.

For years now Fort Michilimackinac had been a scene of great activity. Established by Father Marquette, and kept up by succeeding missionaries, the first to brave the unknown terrors of the interior, it was from here in 1731 that the brave and adventurous Verendryes set out on their long journey to the Forks of the Saskatchewan, and to the Missouri River.

It was the half-way house for all the westward pushing and eastward coming traders, and a meeting place for all the tribes living on the Great Lakes. Here were fur traders, trappers, voyageurs, and Indians, hurrying to and fro, dressed in motley and picturesque attire. Some were bringing in furs from long and perilous journeys from the west, while others were on the eve of departure westward, and others still were leaving for Montreal. The scene must have been gay and active almost beyond our powers to imagine. Henry was in the midst of all this when the word came to him that a band of Chippewas wished to speak with him; and, however unwillingly, he was obliged to meet them, sixty in number, headed by Minavavana, their chief. "They walked in single file, each with a tomahawk in one hand and scalping knife in the other. Their bodies were naked from the waist upward, except in a few examples, where blankets were thrown loosely over the shoulders." Their faces were painted with charcoal, their bodies with white clay, and feathers were tied in the heads of some, and thrust through the noses of others. Before the opening of the council, the chief held a conference with Campion, asking how long it was since Henry had left Montreal, and observing that the English must be brave men, and not afraid of death, since they thus ventured to come fearlessly among their enemies. After the pipe had been smoked, while Henry "inwardly endured the tortures of suspense," the chief addressed him, saying:

"Englishman, our father, the King of France, employed our young men to make war upon your nation. In this warfare many of them have been killed; and it is our custom to retaliate, until such time as the spirits of the slain are satisfied. But the spirits of the slain are to be satisfied in either of two ways: the first is by the spilling of the blood of the nation by which they fell; the other, by covering the bodies of the dead, and thus allaying the resentment of their relations. This is done by making presents."

"Englishman, your King has never sent us any presents, nor entered into any treaty with us, wherefore he and we are still at war; and, until he does these things, we must consider that we have no other father, nor friend, among the white men than the King of France; but, for you, we have taken into consideration that you have ventured your life among us, in the expectation that we should not molest you. You do not come armed, with an intention to make war; you come in peace, to trade with us, and supply us with necessities, of which we are in much want. We shall regard you, therefore, as a brother, and you may sleep tranquilly, without fear of the Chippewas. As a token of our friendship, we present you with this pipe to smoke."

In reply, Henry told them that their late father, the King of France, had surrendered Canada to the King of England, whom they should now regard as their father, and that he, Henry, had come to furnish them with what they needed. Things were thus very satisfactory, and when the Chippewas went away they were given a small quantity of rum.

Henry was now busily at work assorting his goods, preparatory to starting on his expedition, when two hundred Ottawas entered the fort and demanded speech with him. They insisted that he should give credit to every one of their young men to the amount of fifty beaver skins, but as this demand would have stripped him of all his merchandise, he refused to comply with the request. What the Ottawas might have done is uncertain. They did nothing, because that very day word was brought that a detachment of English soldiers, sent to garrison the fort, was distant only five miles, and would be there the next day. At daybreak the Ottawas were seen preparing to depart, and by sunrise not one of them was left in the fort.

Although it was now the middle of September, the traders sent off their canoes on the different trading expeditions. These canoes were victualled largely with Indian corn at the neighboring village of L'Arbre Croche, occupied by the Ottawas. This corn was prepared for use by boiling it in a strong lye, which removed the husk, after which it was pounded and dried, making a meal. The allowance for each man on the voyage is a quart a day, and a bushel, with two pounds of prepared fat, is reckoned to be a month's subsistence. No other allowance is made of any kind; not even of salt; and bread is never thought of. The men, nevertheless, are healthy, and

capable of performing their heavy labor. This mode of victualing is essential to the trade, which, being pursued at great distances, and in vessels so small as canoes, will not admit of the use of other food. If the men were to be supplied with bread and pork, the canoes could not carry a sufficiency for six months; and the ordinary duration of the voyage is not less than fourteen."

The food of the garrison consisted largely of small game, partridges and hares, and of fish, especially trout, whitefish and sturgeon. Trout were caught with set lines and bait, and whitefish with nets under the ice. Should this fishery fail, it was necessary to purchase grain, which, however, was very expensive, costing forty livres, or forty shillings, Canadian currency; though there was no money in Michilimackinac, and the circulating medium consisted solely of furs. A pound of beaver was worth about sixty cents, an otter skin six shillings Canadian, and marten skins about thirty cents each.

Having wintered at Michilimackinac, Henry set out in May for the Sault de Sainte-Marie. Here there was a stockaded fort, with four houses, one of which was occupied by Monsieur Cadotte, the interpreter, and his Chippewa wife. The Indians had an important whitefish fishery at the rapids, taking the fish in dip nets. In the autumn Henry and the other whites did much fishing; and in the winter they hunted, and through the ice took large trout with the spear, as he describes it: "In order to spear trout under the ice, holes being first cut of two yards in circumference, cabins of about two feet in height are built over them of small branches of trees; and these are further covered with skins so as to wholly exclude the light. The design and result of this contrivance is to render it practicable to discern objects in the water at a very considerable depth; for the reflection of light from the water gives that element an opaque appearance, and hides all objects from the eye at a small distance beneath its surface. A spear head of iron is fastened on a pole of about ten feet in length. This instrument is lowered into the water, and the fisherman, lying upon his belly, with his head under the cabin or cover, and therefore over the hole, lets down the figure of a fish in wood and filled with lead. Round the middle of the fish is tied a small pack thread, and, when at the depth of ten fathoms, where it is intended to be employed, it is made, by drawing the string and by the simultaneous pressure of the water, to move forward, after the manner of a real fish. Trout and other large fish, deceived by its resemblance, spring toward it to seize it, but, by a dexterous jerk of the string, it is instantly taken out of their reach. The decoy is now drawn nearer to the surface, and the fish takes some time to renew the attack, during which the spear is raised and held conveniently for striking. On the return of the fish, the spear is plunged into its back, and, the spear being barbed, it is easily drawn out of the water. So completely do the rays of the light pervade the element that in three-fathom water I have often seen the shadows of the fish on the bottom, following them as they moved; and this when the ice itself was two feet in thickness."

The burning of the post at the Sault forced all hands to return next winter to Michilimackinac, where the early spring was devoted to the manufacture of maple sugar, an important article of diet in this northern country.

This spring Indians gathered about the fort in such large numbers as to make Henry fearful that something unusual lay behind the concourse. He spoke about it to the commanding officer, who laughed at him for his timidity. The Indians seemed to be passing to and fro in the most friendly manner, selling their fur, and attending to their business altogether in a natural way.

About a year before an Indian named Wawatam had come into Henry's house, had expressed a strong liking for him, and, having explained that years before, after a fast, he had dreamed of adopting an Englishman as his son, brother, and friend, told Henry that in him he recognized the person whom the Great Spirit had pointed out to him for a brother and that he hoped Henry would become one of his family, at the same time making him a large present. Henry accepted these friendly overtures, and made a handsome present in return, and the two parted for the time.

Henry had almost forgotten his brother, when, on the second day of June, twelve months later, Wawatam again came to his house and expressed great regret that Henry had returned from the Sault. Wawatam stated that he intended to go there at once, and begged Henry to accompany him. He asked, also, whether the commandant had heard bad news, saying that during the winter he himself had been much disturbed by the noises of evil birds, and that there were many Indians around the fort who had never shown themselves within it. Both the chief and his wife strove earnestly to persuade Henry to accompany them at once, but he paid little attention to their requests, and they finally took their departure, very much depressed; in fact, even weeping. The next day Henry received from a Chippewa an invitation to come out and see the great game of baggatiway, or lacrosse, which his people were going to play that day with the Sacs. But as a canoe was about to start for Montreal, Henry was busy writing letters, and although urged by a friend to go out and meet another canoe just arrived from Detroit, he nevertheless remained in his room, writ-

ing. Suddenly he heard the Indian war cry, and, looking out of the window, saw a crowd of Indians within the fort furiously cutting down and scalping every Englishman they found. He noticed, too, many of the Canadian inhabitants of the fort quietly looking on, neither trying to stop the Indians nor suffering injury from them; and from the fact that these people were not being attacked, he conceived the hope of finding security in one of their houses. This is as he tells it:

"Between the yard-door of my own house and that of M. Langlade, my next neighbor, there was only a low fence, over which I easily climbed. At my entrance I found the whole family at the windows, gazing at the scene of blood before them. I addressed myself immediately to M. Langlade, begging that he would put me into some place of safety until the heat of the affair should be over, an act of charity by which he might perhaps preserve me from the general massacre; but, while I uttered my petition, M. Langlade, who had looked for a moment at me, turned again to the window, shrugging his shoulders and intimating that he could do nothing for me—*Qu'en voudriez-vous que j'en ferais?*"

"This was a moment for despair; but the next a Panian, a slave of M. Langlade's, beckoned to me to follow her. She brought me to a door, which she opened, desiring me to enter, and telling me that it led to the garret, where I must go and conceal myself. I joyfully obeyed her directions and she, having followed me up to her garret door, locked it after me, and with great presence of mind took away the key.

"This shelter obtained if shelter I could hope to find it, I was naturally anxious to know what might still be passing without. Through an aperture which afforded me a view of the area of the fort, I beheld, in shapes the foulest and most terrible, the ferocious triumphs of barbarian conquerors. The dead were scalped and mangled; the dying were writhing and shrieking under the unsatiated knife and tomahawk, and, from the bodies of some ripped open, their butchers were drinking the blood, scooped up in the hollow of joined hands and quaffed amid shouts of rage and victory. I was shaken, not only with horror, but with fear. The sufferings which I witnessed I seemed on the point of experiencing. No long time elapsed before every one being destroyed who could be found, there was a general cry of, 'All is finished!' At the same instant I heard some of the Indians enter the house in which I was.

"The garret was separated from the room below only by a layer of single boards, at once the flooring of the one and the ceiling of the other. I could therefore hear everything that passed; and, the Indians no sooner in, than they inquired whether or not any Englishmen were in the house? M. Langlade replied that 'He could not say—he did not know of any'—answers in which he did not exceed the truth, for the Panian woman had not only hidden me by stealth, but kept my secret and her own; M. Langlade was therefore, as I presume, as far from a wish to destroy me as he was careless about saving me, when he added to these answers that 'They might examine for themselves, and would soon be satisfied as to the object of their question.' Saying this, he brought them to the garret door.

"The state of my mind will be imagined. Arrived at the door, some delay was occasioned by the absence of the key, and a few moments were thus allowed me in which to look around for a hiding place. In one corner of the garret was a heap of those vessels of birch-bark, used in maple-sugar making, such as I have recently described.

"The door was unlocked, and opening, and the Indians ascending the stairs before I had completely crept into a small opening which presented itself at one end of the heap. An instant after four Indians entered the room, all armed with tomahawks, and all besmeared with blood upon every part of their bodies.

"The die appeared to be cast. I could scarcely breathe; but I thought that the throbbing of my heart occasioned a noise loud enough to betray me. The Indians walked in every direction about the garret, and one of them approached me so closely that at a particular moment, had he put out his hand, he must have touched me. Still, I remained undiscovered, a circumstance to which the dark color of my clothes and the corner in which I was must have contributed. In a word, after taking several turns in the room, during want of light, in a room which had no window, and in which they told Mr. Langlade how many they had killed, and how many scalps they had taken, they returned down stairs, and I with sensations not to be expressed heard the door, which was the barrier between me and fate, locked for the second time.

"There was a feather bed on the floor; and on this, exhausted as I was by the agitation of my mind, I threw myself down and fell asleep. In this state I remained till the dusk of the evening, when I was awakened by a second opening of the door. The person that now entered was M. Langlade's wife, who was much surprised at finding me, but advised me not to be uneasy, observing that the Indians had killed most of the English, but that she hoped I might myself escape. A shower of rain having begun to fall, she had come to stop a hole in the roof. On her going away, I begged her to send me a little water to drink, which she did.

"As night was now advancing, I continued to lie on the bed, ruminating on my condition but unable to discover a resource from which I could hope for life. A flight to Detroit had no probable chance of success. The distance from Michilimackinac was four hundred miles; I was without provisions, and the whole length of the road lay through Indian countries, countries of an enemy in arms, where the first man whom I should meet would kill me. To stay where I was threatened nearly the same issue. As before, fatigue of mind and not tranquillity, suspended my cares and procured me further sleep. \* \* \*

"The respite which sleep afforded me during the night was put an end to by the return of morning. I was again on the rack of apprehension. At sunrise I heard the family stirring, and, presently after, Indian voices, informing M. Langlade that they had not found my hapless self among the dead, and that they supposed me to be somewhere concealed. M. Langlade appeared, from what followed, to be by this time acquainted with the place of

my retreat, of which, no doubt, he had been informed by his wife. The poor woman as soon as the Indians mentioned me, declared to her husband in the French tongue, that he should no longer keep me in his house, but deliver me up to my pursuers; giving as a reason for this measure that should the Indians discover his instrumentality in my concealment, they might revenge it on her children, and that it was better that I should die than they. M. Langlade resisted at first this sentence of his wife's; but soon suffered her to prevail, informing the Indians that he had been told I was in his house; that I had come there without his knowledge, and that he would put me into their hands. This was no sooner expressed than he began to ascend the stairs, the Indians following upon his heels.

"I now resigned myself to the fate with which I was menaced; and regarding every attempt at concealment as vain, I arose from the bed and presented myself full in view to the Indians who were entering the room. They were all in a state of intoxication, and entirely naked, except about the middle. One of them, named Wenniway, whom I had previously known and who was upward of six feet in height, had his entire face and body covered with charcoal and grease, only that a white spot of two inches in diameter encircled either eye. This man, walking up to me, seized me with one hand by the collar of the coat, while in the other he held a large carving knife, as if to plunge it into my breast; his eyes, meanwhile, were fixed steadfastly on mine. At length, after some seconds of the most anxious suspense, he dropped his arm, saying, 'I won't kill you!' To this he added that he had been frequently engaged in wars against the English, and had brought away many scalps; that, on a certain occasion, he had lost a brother, whose name was Musington, and that I should be called after him."

Several times within the next two or three days Henry had narrow escapes from death at the hands of drunken Indians; but, finally, his captors, having stripped him of all his clothing, save an old shirt, took him, with other prisoners, and set out for the Isles du Castor, in Lake Michigan.

At the village of L'Arbe Croche, the Ottawas forcibly took away their prisoners from the Chippewas, but the Chippewas made violent complaint, while the Ottawas explained to the prisoners that they had taken them from the Chippewas to save their lives, it being the practice of the Chippewas to eat their enemies, in order to give them courage in battle. A council was held between the Chippewas and Ottawas, the result of which was that the prisoners were handed over to their original captors. But, before they had left this place, while Henry was sitting in the lodge with his captor, his friend and brother, Wawatam, suddenly entered. As he passed Henry, he shook hands with him, but went toward the Great Chief, by whom he sat down, and, after smoking, arose again, and left the lodge, saying to Henry as he passed him, "Take courage."

A little later, Wawatam and his wife entered the lodge, bringing large presents, which they threw down before the chiefs. Wawatam explained that Henry was his brother, and therefore a relative to the whole tribe, and asked that he be turned over to him, which was done.

Henry now went with Wawatam to his lodge, and thereafter lived with him. The Indians were very much afraid that the English would send to revenge the killing of their troops, and they shortly moved to the Island of Michilimackinac. A little later a brigade of canoes, containing goods and abundant liquor, was captured; and Wawatam, fearing the results of the drink on the Indians, took Henry away and concealed him in a cave, where he remained for two days.

The head chief of the village of Michilimackinac now recommended to Wawatam and Henry that, on account of the frequent arrival of Indians from Montreal, some of whom had lost relatives or friends in the war, Henry should be dressed like an Indian, and the wisdom of this advice was recognized. His hair was cut off, his head shaved, except for a scalplock, his face painted, and Indian clothing given him. Wawatam helped him to visit Michilimackinac, where Henry found one of his clerks, but none of his property. Soon after this they moved away to Wawatam's wintering ground, which Henry was very willing to visit, because in the main camp he was constantly subjected to insults from the Indians who knew of his race.

Henry writes fully of the customs of the Indians, of the habits of many of the animals which they pursued, and of the life he led. He says that during this winter "Raccoon hunting was my more particular and daily employ. I usually went out at the first dawn of day, and seldom returned till sunset, or till I had laden myself with as many animals as I could carry. By degrees I became familiarized with this kind of life; and had it not been for the idea of which I could not divest my mind that I was living among savages, and for the whispers of a lingering hope that I should one day be released from it, or if I could have forgotten that I had ever been otherwise than as I then was, I could have enjoyed as much happiness in this as in any other situation."

Among the interesting hunting occurrences narrated is one of the killing of a bear, and of the ceremonies subsequent to this killing performed by the Indians. He says:

"In the course of the month of January I happened to observe that the trunk of a very large pine tree was much torn by the claws of a bear, made both in going up and down. On further examination, I saw that there was a large opening in the upper part near which the smaller branches were broken. From these marks, and from the additional circumstance that there were no tracks in the snow, there was reason to believe that a bear lay concealed in the tree.

"On returning to the lodge, I communicated my discovery, and it was agreed that all the family should go together, in the morning, to assist in cutting down the tree, the girth of which was not less than three fathoms. Accordingly, in the morning, we surrounded the tree, both men and women, as many, at a time as could conveniently work at it, and here we toiled, like beaver, till the sun went down. This day's work carried us about half way through the trunk; and the next morning we renewed the attack, continuing it till about two o'clock in

the afternoon, when the tree fell to the ground. For a few minutes everything remained quiet, and I feared that all our expectations were disappointed; but, as I advanced to the opening, there came out, to the great satisfaction of all our party, a bear of extraordinary size, which, before she had proceeded many yards, I shot.

"The bear being dead, all my assistants approached, and all, but more particularly my old mother (as I was wont to call her), took her head in their hands, stroking and kissing it several times, begging a thousand pardons for taking away her life; calling her their relation and grandmother, and requesting her not to lay the fault upon them, since it was truly an Englishman that had put her to death.

"This ceremony was not of long duration, and if it was I that killed their grandmother, they were not themselves behindhand in what remained to be performed. The skin being taken off, we found the fat in several places six inches deep. This, being divided into two parts, loaded two persons, and the flesh parts were as much as four persons could carry. In all, the carcass must have exceeded five hundred weight.

"As soon as we reached the lodge, the bear's head was adorned with all the trinkets in the possession of the family, such as silver arm-bands and wrist-bands, and belts of wampum, and then laid upon a scaffold set up for its reception within the lodge. Near the nose was placed a large quantity of tobacco.

"The next morning no sooner appeared than preparations were made for a feast to the manes. The lodge was cleaned and swept, and the head of the bear lifted up and a new stroud blanket, which had never been used before, spread under it. The pipes were now lit, and Wawatam blew tobacco smoke into the nostrils of the bear, telling me to do the same, and thus appease the anger of the bear on account of my having killed her. I endeavored to persuade my benefactor and friendly adviser that she no longer had any life, and assured him that I was under no apprehension from her displeasure; but the first proposition obtained no credit, and the second gave but little satisfaction.

"At length, the feast being ready, Wawatam commenced a speech, resembling, in many things, his address to the manes of his relations and departed companions, but having this peculiarity, that he here deplored the necessity under which men labored thus to destroy their friends. He represented, however, that the misfortune was unavoidable, since without doing so they could by no means subsist. The speech ended, we all ate heartily of the bear's flesh, and even the head itself, after remaining three days on the scaffold, was put into the kettle.

"It is only the female bear that makes her winter lodging in the upper parts of trees, a practice by which her young are secured from the attacks of wolves and other animals. She brings forth in the winter season, and remains in her lodge till the cubs have gained some strength.

"The male always lodges in the ground, under the roots of trees. He takes to this habitation as soon as the snow falls, and remains there till it has disappeared. The Indians remark that the bear comes out in the spring with the same fat which he carried in in the autumn; but, after exercise of only a few days, becomes lean. Excepting for a short part of the season, the male lives constantly alone.

"The fat of our bear was melted down, and the oil filled six porcupine skins. A part of the meat was cut into strips, and fire-dried, after which it was put into the vessels containing the oil, where it remained in perfect preservation until the middle of summer."

When spring came, and they returned to the more traveled routes, and met other Indians, it was seen that these people were all anxious lest the English should this summer avenge the outbreak of the Indians of the previous year. Henry was exceedingly anxious to escape from his present life, and his brother was willing that he should go, but this appeared difficult. At last, however, a Canadian canoe, carrying Madame Cadotte, came along, and this good woman was willing to assist Henry so far as she could. He and his brother parted rather sadly, and Henry, now under the guise of a Canadian, took a paddle in Madame Cadotte's canoe. She took him safely to the Sault, where he was welcomed by M. Cadotte, whose great influence among the Indians was easily sufficient to protect him. Soon after this there came an embassy from Sir William Johnson, calling the Indians to come to Niagara and make peace with the English; and after consulting the Great Turtle, who was the guardian spirit of the Chippewas, a number of young men volunteered to go to Niagara, and among them, Henry.

After a long voyage they reached Niagara, where Henry was received by Sir William Johnson very kindly, and subsequently was appointed by General Bradstreet, commander of an Indian battalion of ninety-six men, among whom were many of the Indians who, not long before, had been ready and eager to kill him. With the command he moved westward, and after peace had been made with Pontiac, at Detroit, with a detachment of troops reached Michilimackinac, where he recovered a part of his property. GEO. BIRD GRINNELL.

A fine mosaic has been unearthed below the Piazza Guglielmo Pepe in Rome. Figures of deer, antelopes, and dogs representing an animated hunting scene are composed of brilliant tesserae on a white ground. The work is so good that archaeologists incline to place it in the first Christian century. Many coins, capitals, sarcophagi, and bits of sculptured frieze have been found while enlarging the foundations of the great memorial to Victor Emmanuel I.—New York Times.

"You were loaded," said the Justice to Charles and Philip Gunn as they were led to the bar by Policeman Burns, who had found them drunk.

"Were you ever pointed in my direction before?"

"No, sir," the Gunns responded in chorus.

"Both barrels discharged," said the court.

## In the Forest.

ALONE in the forest! What a wide diversity of feeling may be experienced as a result of the realization of the above condition.

It may, and generally does, create a sensation of one extreme or the other; either that of infinite pleasure and satisfaction, or that of indescribable terror and a feeling of helplessness. To one familiar with woodcraft and the woods life, the forest contains many of the conveniences and all the essentials of man's existence; hence it can have only a friendly and inviting aspect to him who knows how to utilize them for his own needs, and he need have no feeling of fear and unrest, even though he may not know just where he is—may be lost; but the inexperienced who is alone in the forest and lost, is just about as helpless and hopeless as the victim of a wreck at sea, floating on a bit of drift with nothing in sight but the waves of the sea. To many who go into the forests each year, the pleasure of their outing would all depart if they were to go it alone; while to the real lover of the woods, and to the one familiar with woods life, there comes a feeling of rapture in being far in the virgin forest, alone, which is far beyond the power of pen to describe, which must be experienced to be understood, and which cannot be experienced to the full when hampered by companions.

Many there are who go into the woods who do not fully experience this pleasure, because they are not endowed by nature with the capacity for such enjoyment—it is not their nature; and to such, the prime motive in making a trip to the forest is that of getting a trophy, or rest, recreation and the companionship of their fellow campers. Companions are all right while around the camp-fire; in fact, are essential to the outing taken for pleasure; but this is a case where two pairs of eyes and two pairs of ears cannot see and hear twice as much as one pair. The fact is, one lone person can see, hear, and observe more than two persons can to travel the same route together. Where two or more are in company, their attention is diverted more or less from their surroundings to and by each other; what one sees or hears he very naturally calls the attention of the other to it. If, for illustration, it be a distant sound made by some inhabitant of the forest, while the discoverer of the sound is telling his companion of it, it may be repeated to such a degree that, had he been alone, and consequently listening intently, he could have determined what it was, and where it was, thereby giving him a decided advantage in approaching, either for the purpose of shooting or observing; but owing to conversation, even though ever so quiet, the repeating sound has passed unnoticed, and we will suppose, for illustration, is not repeated, thereby leaving them without any clue, and consequently without any further knowledge of that which may otherwise have meant a big success. The successful naturalist who studies wild life and nature knows this, and is found alone. Ray Stannard Baker, in his splendid notes on the life of John Muir—that great student of nature—says, "He did not avoid human habitation, nor did he seek it, finding his deepest pleasure in winning the secrets of the woods."

Let two or more persons walk through a stretch of forest in company, talking as they go, and they will conclude that it is destitute of life. Let one person go over the same ground, silently and watchfully, stopping often and sitting or standing perfectly still for several minutes, and a busy life among the woods dwellers will show that it is a place of activity—will show a constant and well conducted warfare and struggle for existence and supremacy among the hunters and the hunted.

While the grouse is industriously scratching and hunting for the smaller insect life to feed her dependent brood, all the while dividing her attention between that and keeping a sharp lookout for danger, the sly fox or stealthy wildcat may be shadowing her and her brood, only waiting an opportunity to secure a morsel to take home to their families, for they, too, must be fed; and nature seems to have endowed all wild creatures with a feeling of responsibility, and an impulse to act accordingly, which should put the blush of shame on some of the higher order of animals, if they would but study the lives of the lower creatures, and absorb the lesson to their own well doing.

A sound of mighty battle among the larger creatures is heard, and a quiet approach reveals the struggles of two buck deer, or other of the larger animals, striving for supremacy, as to which is the better qualified to carry the honors of being leader of his district; just as men will strive for civic or national supremacy and leadership, only by a more legitimate and honorable method than that employed by some men, in attaining their exalted position.

Who can be much alone with nature without feeling a more profound reverence for the Creator and director of all the harmonious laws of nature which exist where the government of man has not been established, and how much greater tendency such surroundings have to creating everything in man which is good than that of city life, or thickly populated surroundings, where people acquire selfishness by the very nature of their surroundings and occupations? For honesty, unselfishness, and real goodness of heart compare the average backwoodsman—an old guide, for instance—with the average man in society, and see which will naturally, unconsciously, put himself to the greatest inconvenience to accommodate a fellow man, without any obligation for so doing other than an unselfish desire to be neighborly. You are in the city or large town among strangers; you are hungry and must eat; there you pay the highest price in the land for a meal. Start out into the country and stop while yet in the thickly populated farming district for a meal, and you pay less than in the city; as you go further out where it is more sparsely settled, you pay less, and by the time you reach the thinly settled backwoods districts, you would insult the settler by offering pay for a meal, or any other favor which he could show.

Once while my father and I were wandering around in a wild and wooded part of West Virginia, hunting for a great cave of which we had heard, we had given up finding it, and were on our way back to the railroad, when we met an old man and his wife, native mountaineers. After telling them of our vain search, the old man started

at once, in the most matter-of-fact manner, to guide us to it, saying: "It's not over a half-mile," and, in spite of our protest, he went the entire distance with us, led us into the cave as far as we cared to go, told us many interesting things connected with it, among which was that of a lot of horses being hidden in it during the Civil War; then, as our time for getting back for our train was too limited to allow us to go back by the way we came, he guided us a considerable distance to where he could show us a nearer way back; in the meanwhile saying what a pity it was that he had not found us sooner, that we could have gone home with him and had dinner, only bidding us good-by when there was absolutely nothing else he could do to help us. A typical backwoodsman, whose great, good soul was undefiled by the evil of the world as men make it, who had spent a long life in the woods. Success to all the noble efforts made to preserve and perpetuate the woods.

MORGANTOWN, W. Va.

EMERSON CARNEY.

## A Vision in the Night.

Editor Forest and Stream:

Under the caption, "It Just Happened So," Julian the Foxhunter gives us an occurrence that is a good deal like one that happened to me.

Just fifty-five years ago this coming spring, when I was a boy ten years old, a favorite aunt, my father's youngest sister, died suddenly. I had always thought a great deal of this aunt; she had nursed me when I was a baby, and whenever I was out at my grandmother's I put in most of my time in following her around while she was doing her work.

She died at her mother's house, four miles from town, and I did not get a chance to attend her funeral. My father was away on his boat and could not be reached in time to attend it; and my mother, taking my two younger brothers, went, leaving me at home by myself. I remember that I raised a row about not being given a chance to see my aunt again.

I slept by myself in a small upstairs room, no one but me being in it. The room had only one window, and a door that I kept locked every night, as a stairway from the outside led up to it. My bed, a low cot-bed, was right under the window. One night, a week after my aunt's death, I was lying fast asleep, with my face to the wall, when I was wakened up by a feeling that there was someone else in the room. I have that premonition, or whatever it is, even now; if a stranger should come into a room when I am in it alone, I can tell he or she is there without hearing or seeing them; if I am asleep, their presence wakens me up. I was wide awake now, and turning myself over I saw my aunt as plainly as I had ever seen anything. She stood within two feet of my bed. I could have stretched out my arm and taken her by the hand; but raising myself on my elbow I lay there staring at her, while she stood looking at me and smiling. Her long hair hung down her back in a loose bunch, just as she always wore it when alive, and she had on a white dress with small red spots, one that she wore in the summer when attending church on Sunday.

I felt prompted to reach out and take her hand, or at least speak to her, but remembered that she was dead, and if I spoke it might frighten her and send her off.

While I was thinking about this, she moved her lips as though trying to speak, but I heard no sound. Then she smiled at me again, and, moving backward, slowly backed into a far corner of the room against a solid wall, and slowly faded away. I jumped up and ran over to the corner, but saw nothing, of course.

I told my mother the next morning about my aunt Eliza having visited me. "No," she told me, "you did not see her at all; she is dead, and dead people cannot come back. You were only dreaming about her." I knew better, though; it was no dream.

I got permission to go out and see my grandmother; I wanted to see what she would say about this. She was an old Virginia woman—an old woman then, but she lived to be ninety-six years old. Two of her sons and three of her daughters lived as long; and her other four sons, my father was one of them, were all of them killed by accident; were it not for that the most of them would no doubt have lived as long as she did. She had come of a good family, had a better education than most women in her day, and had no superstition of any kind. She was an aunt to Alexander H. Stephens, the Vice-President of the Southern Confederacy, and afterwards the Governor of Georgia; that made Alex (the old lady always called him Alex) my first cousin once removed; I knew him quite well.

I told my grandmother of Aunt Eliza's visit to me the night before, and what my mother had said about it. "How was she dressed?" she asked me, and I told her. "Yes," she said, "you saw her; tell your mother that I say so. You were not dreaming. We buried her in that dress; she asked to be buried in it." I had not known that before.

"Now," she said, "she may come again; she will come to you if she does. When she does, you speak to her, you won't scare her away."

I lay watching for her every night, then; but she never came again, and a month after this my father was drowned. He was an engineer on a coal towing boat, and a capstan bar striking him when a rope on the capstan broke, knocked him overboard. Whether that visit from my aunt and his death had any connection or not, of course I cannot tell; but I have always believed it had, and that this was what she had been trying to tell me. And from the time I got old enough to think of it, I have always expected to see her again just before I die or am killed myself. This notion has got to be so fixed in my mind that I have gone into battle (I had a share in some of the hardest battles in the Civil War, and have been in any number of Indian fights since) without feeling the least fear of being shot, for I had not seen my aunt yet.

## Camp-Fire Flickerings.

"That reminds me."

## The Old Hunter's "Grip" Story.

THE old man carefully filled his pipe and lighted it with a coal from the camp-fire. "Say, Kurn'l," said he "I reckon I haint never tole ye that ar grip story?" I assured him that he had not. "Wall, here it are," said he. "One day I tole my ole woman that I'd go and get some ducks, so I took Ole Bess and loaded her with three han's an' started. I rode 'long 'bout half er mile, when I seed er flock comin' and turned Ole Bess loose inter 'em an' killed four. I started in sort o' lazy like to load Ole Bess, and jes' as I got 'er loaded I heard sort of a swish out that ar way, an' ez I looked I seed a big grip jes' risin' out er the water with one ov my ducks. I jerks Ole Bess ter my shoulder and bangs inter him and down he cum. I pulls right over thar an' picks up three ov the ducks, an' then I sorter begins ter notice that ar grip."

Here I interrupted him, and asked what a "grip" was.

He looked at me pityingly. "Say, Kurn'l, a grip is what you scientifc fellers would call a bald-headed eagle. Az I said afore, I begins payin' 'tention to that ar grip. He hed fas'ened onter that ar duck like death ter a nigger. I wanted the duck, but I seed that I had only broke ther end ov his wing, so he couldn't fly, and 'ceptin' the lame wing he was jest ez healthy as any bird 'round them parts. Say, Kurn'l, did yer ever fight er grip? No, I sorter thought not. Kurn'l, them are cusses cu'd lick ther best grizzly b'ar thet ever trotted, but ez I was sayin', I sorter wanted ther duck, so I gets up close and tries ter 'shoo' him, but he wouldn't 'shoo' wuth a cuss. Then I jabs at him with Ole Bess, but the grip jest gripped my gun and jest friz onter it with one foot; so I pulls him inter the boat, and he drug the duck in with his other foot.

"I sez ter myself, 'Well, ole man, I'll give yer a ride home 'th me.' I went ter get an oar outen the bottom ov ther boat, but the grip riz up and commenced hostile operations at onc't. I retreated ter th' other end of ther boat ter think it over. Soon as I left him he commenced ter eat ther duck. That ar conduct sorter riled me, an' I started to'rds him, but he spreads himself out and screeched, an' hed a sort of look in his eye that I didn't like, so I reconsidered the matter.

"By this time we had drifted out inter rough water, an' it was gettin' 'long to'rds night, an' we wuz gettin' close to some breakers, an' I figgered it out thet the grip wuz in kemand ov thet boat, and I wuz sort ov a steerage passenger, only he wouldn't let me steer. I cu'd see someone on ther shore, an' takin' my sliker I stood up an' waves and yells loud ez I cu'd. Say, Kurn'l, durn my buttons, if that ar cuss didn't hop onter the gunnel an' flop his wings an' screech t' raise the dead; an' he looked ready ter fight an eliphant, an' he wuz, too.

"About this time I begin ter get narvous, fer we wuz right close ter the breakers, an' I dasn't try ter git an oar, fer that cuss would hev mauled the stuffin' outen me, an' chawed me all up in no time. Ole Bess wuzn't loaded, an' I hed los' my powder horn in the fust of the skirmish, an' besides, the grip hed Ole Bess in his end ov the boat, anyway, an' it looked sort ov squally fer yer Uncle Darius. Jest then I looks toward home, an' seed a boat startin' out. I yelled, an' the grip screamed, an' soon they come, an' I wuz powerful glad ter see 'em. They towed me an' ther grip in, or, I reckon more korrectly, ther grip an' me. By this time ther wuz a big excitement on shore, an' all ther wimen folks wuz thar. My woman hollers, 'Darius! what on arth hev yer got?' I hollers back, 'Iv got ther devil, an' am bringin' him in.' It bein' 'bout dark, an' that ar grip standin' on the gunnel an' screechin' must ov looked sorter odd like from the shore, an' them fool wimen tho't I hed the devil sure nuf, an' some run, an' some screamed, an' some fainted, an' in th' excitement that ar cussed grip got erway, an' 'scaped inter ther woods."

O. C. F.

## A Hybrid Jack.

A SIX-POUND fish was caught here in Beaver Creek on Saturday night which has the head and fins of an esox, and the proportions and general complexion of a small-mouth black bass. Jack and trout (local for black bass) are both caught in the above-named stream in great abundance. Formerly this stream was open to the public, but is now a magnificent preserve belonging to Herbert Lutterloh, Esq., on which he has spent many thousands of dollars for dams, keeper's house, and valuable accessories. In this locality a pike is a jack; that is the English of it, Fayetteville being originally a Scotch settlement. It is distinguished from the pickerel by the fins, those of the latter being bright red. The depth of this fish was about 1 to 4½ of the length, and the length of head was about 1½ in proportion to length of body, the latter being 22 inches. There were no bar marks on this fish, the coloration being solid and precisely like that of a small-mouth black bass, and it would be taken for such as it laid in a pile with others, unless the shape of the head were detected. Our folks here allow it to be a hybrid. It is a freak, anyhow. Beaver Creek is a tributary of Cape Fear River.

### Cold Weather Messages from the Woods.

*Mr. Bruin:* I kind of looked for this. Yes, sir. All last fall I kept saying to myself: "We're going to have an old-timer, sure." Why? Ah, now you are asking me something. Maybe it was the leaves or maybe it was the clouds or maybe it was something else. Anyhow, I felt it in my bones. And so I says, "I ain't going to get caught," and I went and put on an extra layer or two of fat. And I guess I did the right thing, all right all right. Oh, I ain't so slow, though some people do call me a slouch.

*Mr. Fox:* I am a poor, innocent, guileless little fox. When I think of the struggle I have had this winter I am moved to tears of self-pity. How often I have had to go to bed cold and hungry. The snow has frozen so hard that the rabbits have left no trail and the chickens have been kept indoors for the most part. Then the quail and the partridge have been getting scarcer and scarcer, and altogether it's been a terrible struggle. And it ain't right. I am sure I have done nothing to deserve it. Excuse me—my tears are flowing again.

*Mr. Moose:* I haven't left my "yard" for over a week, though the spruce boughs are nearly all bare. The fact is, I am afraid to travel. This winter has been a terror, and that's a fact. Tough as I am and ugly (that is to say, brave), it has made me as weak and timid as an old cow. If the fellows with the guns (the bad men!) were here now they wouldn't have to try many of their clever stunts to get a crack at me. Egad! I think I'd rather like to be shot.

*Mr. Caribou:* I think I won't come south any more. What's the use? Up in the barrens it's no colder than this. And food's no scarcer. For the snow here is so deep and so hard that it is nearly impossible to get down to the moss. I don't mind the cold if I get my belly full, but it plays the dickens with me if I don't. I am reduced to mere skin and bone. The only decent thing about me is my antlers. They are a fine pair, but I think I'd give them for a square meal. What! Give my head? Oh, I must be raving.

*Mr. Squirrel:* I ain't like some folks in the woods—I don't leave things to chance. I keep my weather eye open and make provision for days like these. All winter I have lain snug in my hole, with a plentiful supply of nuts. Still, it's been a little monotonous lying so close. Other winters I used to have a chance to stir out once in a while, but never a one this. It's been a long siege, and I won't be sorry when the spring comes.

*Mr. Bluejay:* I haven't uttered a sound for I don't know how long. The voice which I so loved to hear has become indifferent to me. I am no longer what I was. Cold and starvation have robbed me of my conceit—my assurance. I am no longer even curious. 'Tis true, my beautiful blue plumage shines with a new lustre, but it is as if to mock the skeleton beneath it. Why didn't I migrate in the fall? I had promptings, but ignored them

(with my customary conceit, thinking that I was equal to anything that came along). O, fool!

*Mr. Chickadee:* Ha! ha! but this is jolly. The colder it is the better I seem to like it. You ought to have heard me the other day when the rocks were cracking. How I flew about and made the woods ring with my joyous cries. Pshaw! I have no use for your chicken-hearted folks that fall into the dumps or give in at the first show of trouble or danger. Be up and at it. And don't take yourself too seriously, or life too seriously. None of us, I guess, is so very necessary, after all, and life is just what we choose to make it, for the most part. I saw to-day half a dozen of great, serious ravens lying dead in the snow, while I was about as lively as a June cricket. Even a winter like this respects a brave, cheerful bird (which I am, though I say it myself). Chickadee-dee-dee!

*Mr. Bob White:* I can stand a good deal, for I am naturally plump and well covered, but this is too much. Oh, what a winter! One cold wave after another, and the last always the worst. I am a mere wreck, and if I wasn't an old experienced bird I should be dead. I knew how to burrow in the snow and keep from getting frozen in, and I knew where a few seeds or berries might be found. Then I didn't get "rattled" and fly about from place to place and exhaust myself, so that when a sneaking fox came along I was always able to give him the slip. But in spite of all this, I might not have pulled through if it hadn't been for a stroke of good luck. One day, by mere accident, I came upon a patch of ground swept clear of snow and strewn with seeds. What a delightful surprise it was, to be sure, and how I pitched in and satisfied my hunger. After that I hung around the place, and next day the apparent miracle was explained. A nice kindly-faced old man appeared carrying a bag, and when he reached the bare patch he put his hand in the bag and scattered more seeds. I thought I was now in Easy street. But, alas! after a week or so the old man did not appear any more, and I suppose he was taken sick. However, being built a little on the strenuous order, as I have intimated, I struggled on and I am going to keep it up while there is a kick in me. But I do hope the spring is not far off, and if I survive how I shall make the meadows ring!

*Mr. Owl:* Did I hear something stir? No, dreaming again. Well, it's lucky I am such a good hand at sleeping, for there's nothing much else to be done this winter, and it relieves the pangs of hunger. It seems to me the Arctic regions have broken loose. Is the world coming to an end? I am accounted very wise and ought to be able to say something on that question, but I can't. Between ourselves, I don't know more than I should. I can look very wise, but that's all. It's merely a trick of the eyes. I have to laugh sometimes when I think how people are fooled by my looks. I am a big fraud, and that's the candid truth. I make this confession fearing I may have to pass in my checks before I have another opportunity of easing my conscience.

*Mr. Jack Sparrow:* My hey! but ain't it cold. I've been 'angin' around this 'ere Battery Park all winter, and I might as well 'ave been up in the Arctic regions. The park piled up with snow and the bay piled up with hiccups and the winds—great guns! 'Ow they 'ave swept down from the skyscrapers. Then food's been so precious

'ard to get that starvation 'as stared me in the face twenty times, which those cussed cable-cars and automobiles are chiefly to blame. I believe they were hintroducted in horder that we might starve. And, as I mentioned the skyscrapers, I believe they were hintroducted in horder that we couldn't build. Not a hole or a corner left in 'em to stick a nest. But we'll build all right. Just you watch our building hoperations in the spring. We ain't the sort that can be froze out, I promise you. We don't come of that stock. 'Ere we are and 'ere we stick. So ta, ta! (Is that a scrap I see over there? Yes, I guess I'll take a hand in.)

#### The Spirit of the Woods:

I mark with deep and solemn joy  
The rigor of the year;  
For everything it shall destroy  
A better will appear.

No offspring of the lair or nest—  
No thing that is alive—  
Shall perish but because it's best  
That it should not survive.

For Nature's ways are always wise;  
Deem not that she is blind  
Or vengeful when a creature dies:  
She's cruel to be kind.

FRANK MOONAN.

NEW YORK, Feb. 19.

### A Lecture on Arctic America.

At the American Museum of Natural History, on the night of Thursday, Feb. 25, Mr. Andrew J. Stone, the Arctic explorer, delivered an interesting lecture illustrated by many beautiful photographs. These covered a wide range and consisted of Alaska scenery, animals and birds, natives and flowers. Many of them were of extreme beauty and appealed very strongly to the large audience.

Mr. Stone called attention especially to the importance of the study of the distribution of animal life, and pointed out that notwithstanding the fact that he had been collecting specimens in the Arctic for nine years, and that other trained collectors had been working there, there were vast areas from which, as yet, no museums had any specimens of such animals as the bears, the moose, and the caribou. He alluded to the various causes which affect, or may be supposed to affect, the distribution of various species of animals, and which may have had an influence in differentiating species and sub-species in regions similar or adjacent.

After the lecture was over the audience was invited upstairs to the large mammal room of the museum, where a number of unmounted specimens brought back by Mr. Stone were displayed on the floor. Among these were most of the main mammals of the north—a large number of brown bears, black bears, white goats, moose, caribou of three species, a number of specimens of Stone's sheep; besides wolves, foxes, wolverines and many bird skins. These specimens were examined with great interest by all the visitors, among whom there were many big-game hunters.

### Amateur Moose Calling.

THE calling of moose is quite generally practiced by Indians and by many white woodsmen, but rarely by sportsmen. It has come to be considered the regular and expected thing for the man who hunts the moose in Nova Scotia or New Brunswick, to engage each year a woodsman to call for him. My own experience leads me to believe these sportsmen might, with much addition to their pleasure, some saving of expense and better chances of success, do their own calling.

My knowledge of moose hunting by calling has been gained by seven annual trips to the Miramichi country of New Brunswick. The first two years I was guided by James Fowler, of Doaktown, an expert moose caller, and from him I learned to call. In 1899 I made the first hunt depending on my own calling, and sounded the horn all my voice would bear for nearly two weeks before receiving any answer. By that time I had become very suspicious of my calling, but subsequent experience has led me to believe the season was not far enough advanced. Guides naturally want to make the season of their employment as long as possible, and often get their parties into camp as early as the law is off, or Sept. 15. It is, however, a rare thing for a moose to come to a call earlier than Sept. 20, and the chances are not good before the 22d or 23d. From these dates for ten days is the best time, though if I were in the woods and had not secured any moose I would continue to call till Oct. 10.

In the five years I have called, I have secured five moose—all the laws allows. The first year I practiced daily as much as my voice would stand for three months before the hunting season, and other years, three or four weeks. Thus I learned to sound the same note every time, and in a measure strengthened

my throat to stand the strain of calling which is very considerable, especially to one who is unaccustomed to singing or public speaking. Most sportsmen who have any opportunity to hear a caller can acquire this simple art. If I have been able so to do, sure any man may, for I have no ear for music, cannot keep the tune of the simplest melody, have a delicate throat and an untrained voice. Still I have been successful with the birch horn, and have found in it a keener pleasure than in any other line of sport.

When one has learned the call there is still much to learn about moose calling. No two moose decoy alike. One will come in quietly, yet boldly and close; another will come crashing through the bushes and blow-downs, answering at every step and striking his horns against the trees. This is the kind of moose not to hunt if you are afraid of a noise. Yet another will circle in caution, or come noisily till near, and then circle and come quietly.

It is quite usual in a good moose country for two bulls to live in one section, as in the valley of a small brook. These are usually one big moose, and a spike-horn of two to four years. They consort together in harmony through the summer and early fall, but quarrel when the rutting season comes; and the hide of the smaller will show the marks of the horns of the larger.

In 1902 my camp was located on an unnamed little stream, flowing into the Dungarvon River. Near this camp was a steep hillside, burned nearly bare, to which early one morning I went to call. At first sound of the horn a moose answered from the green woods below, and I looked for him to come in sight at the edge of the timber. Some minutes had passed in silence when a challenging grunt caused me to turn, and, there behind me on the bare hillside was a wild looking spikehorn just eighteen yards from me. That so

large an animal could have come in so close without making noise enough to be heard seems impossible, but this he had done, and how long he had stood there is only matter of conjecture. Another year I had located my camp on a tributary of the Renous. The second morning in camp I went alone to a little beaver meadow close to the tote road and called at daybreak. Almost at first a moose answered from up the beaver brook, and not coming as fast as I desired, I called to hurry him, when another answered from the same direction, so that I had the two coming tandem. The first was the larger one, and he had a hard time getting his horns through the alders. When he was pretty near, and yet not in sight he circled to the right, and as he ceased to make any noise I thought he had become frightened and gone away, as called moose sometimes will. The smaller moose still came on and was nearly to the edge of the thick growth when I heard a grunt behind me, and turned to see the first and larger moose looking out of the bushes at the other side of the meadow. His head I now have, and it shows the animal to have been an old one with a twenty-six point head, and no doubt he was very wise in many ways of avoiding the hunter.

Hunting by calling can be made very easy. My way is to call from 4 or 4:30 in the afternoon, as late as the rifle sights show plainly, and from daybreak or a little earlier, till about 8 o'clock in the morning. This gives all the middle of the day for reading, and the rest a busy man needs when on his vacation. As nothing is worse for moose calling than to have men moving about a country and tracking it up, I always stay in camp through the middle of the day and insist on my men doing the same.

It is well to call in the morning at the same place one has called the night before, as a moose may be

attracted by the call at night, and be somewhere in the vicinity and ready to come to the morning call. This makes it necessary to pass some nights in the woods away from camp, and entails some small hardship.

Moose callers vary in their methods, and somewhat in their call. My way is to call first four times; once to each point of the compass, because the birch horn is like a small megaphone and the sound goes farthest in the direction in which it is pointed. After the first call, I wait about fifteen minutes between calls and then call two or three times. If a moose answers and is not close by, I immediately call two or three times to have him locate the sound well and then do not call any more so long as he is coming satisfactorily. Should he hesitate, I may call to hurry him, but am very careful about calling him when he is close by, lest he detect a false note.

Where moose have been little hunted by calling they will often come boldly in without any coaxing, but if any coaxing is needed, nothing is better than to get into water and slosh around like a moose feeding. For this reason I like to call from the side of a brook. Beaver meadows make good places to call, and in them water can always be found. It is easier to call a moose down to low lands from the hill than it is to call them up, probably because sound rises. For successful calling, still, frosty weather is best, and last fall was ideal in this respect. Out of six mornings I was in camp in the height of the calling season, four were perfect, with a clear, still, resonant air. As my guide expressed it, we could hear the call go away and come back again.

FRED TALCOTT.

PROVIDENCE, R. I., Feb. 27.

## Life in the Woods.

### V.—A Rainy Day in Camp.

OUR preparations for stormy weather were not ill-advised, for the next morning the patter, patter, patter of the drops of rain on the canvas roof of our camp gave indications that there would be no hunting that day. The wind was laden with moisture, and it sobbed and sighed in the pine trees with a homesick sort of sound. The drops of water hung from everything, and little rivulets ran down the sandy banking of our camp soon to be absorbed. Outside two meat hawks hopped about in a disconsolate sort of a way, and the smoke from our stove settled off to leeward, close to the ground, forming a small cloud of its own. One by one the boys turned out of the bunks, after a wash and a glance outdoors, came back looking almost as melancholy as the bedraggled jays outside. But after all a rainy day in camp is not a bad sort of a thing. There is always, in a party of four or more, plenty to do. In the first place there is the cooking, the baking and the boiling for a few days ahead. Then there are guns to be overhauled and thoroughly cleaned. Moreover, a man cannot be in the woods many days without the thorns and knots and snags getting in their work on his clothes, and so a rainy day affords a good time for a general process of mending. It is a good time, too, for writing letters, by which for a moment the threads of everyday life, which are severed when one plunges into the wilderness, are reunited. It is a good time for reading over the neglected bundle of newspapers and finding out what has been going on in the outside world. It is a good time, also, for perusing the pages of a book which has been brought to camp to help pass away the time. Then there is the ammunition to be looked after, and a dozen and one little things, so that a legitimate complaint of nothing to do is not easily found. A good pack of cards is not the worst thing to have around on a rainy day, for when other things fail to occupy the mind, a game with them is a pretty reliable sort of a standby to fall back on.

Rainy weather is not the worst time for hunting, if one does not mind the discomforts of it. At such times it is far easier to steal through the woods quietly and take advantage of the unsuspicious game. In a locality where there are plenty of logging roads, a man equipped with macintosh and dry shod can travel without special unpleasantness, and where game abounds, trips along the roads are very frequently successful.

However, we did not hunt that day. We had enough to do in camp, and all seemed tired enough and sore enough over their previous day's experience to stay in and rest. A rainy day in camp is a great time for talking, a "heep big talkem," as the Indian said. I believe it is worse than the proverbial old ladies' tea party which has done service as a standard for so many years. Of course, it wouldn't do to admit this at home, but among fellow sympathizers we can afford to be candid. In the afternoon of the day in question, we had an experience meeting, and being the youngest in camp, the old fellows insisted that I relate how I killed my first deer, and how I felt after it was all over. As nearly as I can remember, I told them of it about as follows:

"My first deer. How well I remember it! The scene is pictured before me as plainly as if it happened but a day or so ago. I can see the winding 'tote' road, the edge of the heavy pine wood where I stood, and before it the partially charred area where fire and wind had worked as thoroughly as the ax of the busy pioneer. Then there were the huge rocks, which through the mists of early morn or in the twilight dim used to loom up as large as houses. To the left a high hill, which we called the 'Lookout,' and which towered above the trees, stood out in bold relief against the sky, and over in front of it sparkled the arms of the Spread Eagle Lake which some imaginative cruiser had transformed in his mind into the outstretched wings and legs of our noted bird of liberty. I can remember the morning as if it were to-day. The boys had bothered me because of my inability to kill a deer, and had told me that I did not get up early enough. 'The early bird catches the worm,' had been sung at me so often, 'that long before daylight, when the stars still held solemn watch over our shanty, I had crawled out of my warm bunk, hastily swallowed a little lunch and started over the road with the cold chills chasing down my back like sleds on a toboggan slide, and the frost nipping

at my ears and hands. Rosy fingered Eos had not yet appeared in the east when I started, but the first of her pyrotechnical display soon became faintly visible on the horizon. Every stump looked as big as a cow; and at every sound it seemed as if it must be a deer or perhaps a bear. Slowly and cautiously I prowled along the road carefully not to make any more noise than possible, but with my heart thumping so loud that it seemed as if it could be heard quite a distance away. The chariots of light sped rapidly on and, by the time I reached the edge of the woods the lamp of day was just beginning to show over the horizon, and had decked the frost covered foliage with all the glory of the prismatic hues. I was tired, and I was cold. I had crawled out of a warm bed before my time, had seen no deer, had had no shot and consequently was disgusted. The scene, although a grand one, didn't have much charm just then; for to tell the truth, when I started out I had confidently expected before the lapse of so much time to have shot one deer anyway. To say I was disappointed was putting it mild, and in this frame of mind I turned with the intention of retraversing the mile and a half for the purpose of getting some breakfast, when, snap! a stick cracked on the frosty air like the report of a small revolver. I turned quickly and saw coming straight toward me, on an easy lope, three deer bounding along all unconscious of any danger. A doe and two fawns, as beautiful creatures as nature ever turned loose to roam the wild woods. Up came the gurt. The old doe in the lead sniffed danger and stopped. A hasty sight and bang went the rifle, and away went the deer at right angles to the course they had been pursuing. There was a big bend in the road and I ran down to it, hurriedly loading my single shot Remington, in hopes of meeting them around the turn and getting another shot. They never came in view again, and all I heard was a crash as if a small, dead poplar, of which there were many there, had fallen down. I then retraced my steps and tried to find the place where the deer stood when I fired, but I was so excited I couldn't find anything, and so I circled round and round, but no track could I discover on the frozen ground, nor trace of blood. I kept it up for nearly an hour, repeatedly going back to the woods and locating my position. Finally I was forced to admit that I must give it up and so, with a big lump in my throat and tears almost in my eyes, I started back, and stepping over a log, almost walked on as big and as handsome a doe as one ever looked on, lying stark dead. She hadn't gone over six rods from where I shot her, for the bullet striking the point of the shoulder, had gone as squarely through the heart as a surgeon's knife could cut. Perhaps I didn't shout. Perhaps I didn't throw my cap in the air. Perhaps I didn't look that deer over again and again, and then pat her fat flanks. Perhaps there wasn't a happier boy in Wisconsin, and perhaps I didn't make terrible work in my first attempt to dress a deer. Perhaps I didn't smear myself all over with blood and trudge back to camp, stepping high and with head way up. That is the way I celebrated my eighteenth birthday. That is the way I killed my first deer; and when I stuck my head in the camp door, although I was bursting with a desire to talk with everyone all at the same time and keep it up, I managed to contain myself, and thinking to appear wise and like an old hunter, I merely said, 'I caught the worm.'

This account of my experience with my first deer seemed to put all in a rather reminiscent mood, and descriptions of incidents of various hunting trips followed in rapid succession. In fact more deer were shot and hung up that afternoon than during the progress of the entire hunt. At least, that is the reflection which would naturally come to a person after having listened to the talk. As a sample, it being most fresh in my mind, I will try and give in his own language, as nearly as I can, Louis' account of how he killed a deer and lost two teeth in the operation:

"It happened the year we were camped on the Musakono, about five miles south of the Pembine farm. While out hunting one misty day, having my double barrel Parker shotgun, I started several deer, but only got one shot and then missed. I began to look sharper and to be more careful. Finally, I struck a big runway and followed it up hill a little over the top and part way down, when all at once a deer came running right toward me. I waited until about four rods away, fired, and pulled both barrels at the same time, accidentally, as I had gloves on. The deer was struck with such force that it fell over backward and lay bleating. In an instant a small buck followed the deer just shot, jumped over it, made two jumps and stopped and looked back at it. Now, I grabbed in my pocket and got another cartridge, took out the empty shell. Now the buck made two more jumps and stopped. I bleated to stop him. And now I couldn't get my gun closed. I pressed on the cartridge to get it in, looked up and saw another buck following the tracks of the first two deer. A somewhat bigger deer. I bleated to stop him. He was about six rods away; the first one about two. I began to sweat. The cartridge would not go in nor come out. I took the head of the cartridge between my teeth and pulled until two of my front teeth came out, but the infernal thing stuck just where it was. Now starts No. 1 again and looks down at the dead deer. He then ran his horns into a dry tree top. I bleated, and he stopped. By that time No. 2 got uneasy and started, made a jump or two, when I stopped him by bleating. Then I put all my force on the cartridge but could not crowd it in. The first buck started again and ran about three rods back of me, when with a 'wish! wish!' away the two went, and I'll be hanged if I could help it, the tears ran out of my eyes. Now I set to work to get the cartridge out again, found a rather straight stick, put it in the muzzle of the gun, and found it was not very straight after all, but forcing it down, began to strike the cartridge but not hard enough, and slamming it down my finger struck the gun and gave me a severe wound. I finally succeeded in getting the cartridge out and felt better. Now I put in two new cartridges and was ready for some more bucks, but none came, so I stepped down to the deer, which was a doe, and looking for my hatchet and knife, found I had left them in camp and that I had nothing but a little pocket

knife with which to dress the deer. Now to hang her up. I dragged the deer to a small ironwood tree, climbed up it and expected to bend the tree down to where the doe lay, but I got down about six feet away from her, so I had to tie the top of my tree to another tree, and then drag the deer there. I then fastened the ironwood to the gamble stick and let her go. The tree pulled her up about six feet, where she hung nicely. I had laid the heart of the deer on a big log, and now sat down beside it to eat my lunch. This took some time, so that it was 11 o'clock before I started back to camp, forgetting to take the heart. I got back about 1 o'clock. It was about three miles from camp to where the deer hung.

"In camp I found a friend who, with his brothers, was hunting in the same neighborhood. He asked me if I blazed out. I told him no, but that I could easily find the place again. He remarked that he thought it would trouble me some to do it, and so it did. We tried for two whole afternoons to find that deer, and did not succeed. Next day was Sunday, and Monday morning we were to leave the woods for home. So, Sunday, the last effort was made to find the deer. I took all the necessities and started from the place where I struck the river when coming out from the deer, and hunted and hunted until I came to a place which I pronounced the place where I hung up the deer, looked around, yes, there was the little ironwood tree on which I hung her up, and there lay the heart yet on the log. That I took along to show that I found the spot, but that some Indian had stolen the doe.

"All I could do now was to hunt back and try and make up for the lost one. I hunted very carefully; walked a hillside for a mile and a half, and getting tired, stepped upon a sort of flat and heard a noise. There came a buck about eight rods away. I up and shot. Down come the deer, but was right up again. I gave him another shot, and down he came again. I quick put in another cartridge. Just as he was trying to get up I fired again, and he rolled over, down the hillside. I walked on slowly, and he rolled on half way down the hill and then held up his head until I shot him through the neck. I dressed him; but did not have much to hang him up with, except some half-rotten sticks. I got him started, and down he came on my shoulder, hurting me so I thought I would faint away. But I stopped him coming down entirely and propped him up with his head part way to the ground. 'There,' says I, 'hang there, I won't touch you again.' My shoulder ached so I was good and mad. Now I blazed out, and when I reached the river I heard the boys calling to me. They came with a lantern and helped me through the swamp, and as we went along, I told them my experience and how some Indian had stolen my deer. The boys laughed and made me mad, but when I reached camp I laughed, too. There I found my lost deer; for the Colonel and Henry had found the place before me, and carried the deer into camp. In all my hunting that was altogether the most troublesome affair I ever had."

CAROLUS.

## Can Ducks Smell?

In re

LIMBURGER vs. DUCKS.

COAHOMA for plaintiff.

CHARLES CRISTADORO for defendant.

This cause coming on to be heard in the High Court of FOREST AND STREAM at the February Term, 1904, the parties appeared in court by their attorneys, whereupon demurrer is entered by plaintiff, who shows that in defendant's pleading he wrongfully assumes the attitude of plaintiff instead of defendant as he properly should; and said Limburger by his attorney, Coahoma, prays that the court shall make correction in this matter, and for cause, showing that a material point is involved as affecting the rights of said Limburger as plaintiff, and prays that said Coahoma, attorney for Limburger, shall be named as plaintiff herein, and said Cristadoro be made defendant, wherein it is a material point, to wit, that the burden of proof be placed on said defendant to show that ducks do smell, in accordance with defendant's allegation to that effect, which said allegation should be supported by evidence, and not by mere surmise, inference, or other indirect and ineffectual process.

And plaintiff further pleads that the assumption by defendant that the said ducks did smell the Limburger as the reason assigned for flying shy of defendant's blind; and that the circumambient atmosphere was so infected and made redolent by the obtrusive aroma of the said Limburger as to cause a deflection in the flight of said ducks away from the region whence emanated the said alleged aroma; and that said ducks, in consequence of the effect of said aroma on their olfactory senses, imagined that the said blind was filled with noisome perils instead of live gunners, and deemed that the danger was greater to them from the occupancy of said blind by the alleged perils than by said live gunners; and deemed that to be a country that was unhealthy for ducks in consequence thereof, and so betook themselves elsewhere; plaintiff now says that all and several the said assumptions of defendant are without sufficient warrant in fact, and should be supported by other and more material evidence. Plaintiff offers further to show that ducks often fly shy of blinds for no assignable cause, and that such shyness often results from the department of those who occupy said blinds; and that under certain circumstances far-fetched and fantastic reasons are sometimes advanced to account for empty game bags; and that in the case at bar a strong suggestion arises in that direction; and plaintiff further avers that no case can be cited by defendant wherein ducks were known to fly shy of any blind by reason of said blind being occupied by dead men, but on the contrary.

Plaintiff further pleads that in his declaration wherever defendant joined issue the averment is not specifically made that ducks are indifferent to the appetizing odor of Limburger, but that all the fowls of the air, without discrimination, are equally and wholly indifferent to all smells and odors whatsoever; and are in fact without the smelling faculty; and now cites the case of C. Crow

et al. vs. Hunter et al., 17 Æsop, 30 ed., chap. 6, sec. 2019, *et seq. non seq.*, etc. (Chitty on Evidence), wherein said Crow enters complaint that said Hunter covered up his slain deer with leaves, thereby concealing same from the vision of said Crow, and so depriving him, the said Crow, of his wonted right and privilege of digging out the eyes of said quarry while still fresh, and then awaiting the progress of dissolution, when, said deer should become ripe for the penetration of his hide by the talons and beak of said C. Crow et al.

And plaintiff offers to show many other authorities, all to the same purport, if granted sufficient time, and upon this he puts himself on the country, and prays that a jury be impaneled to try the issue.

Do I hear someone exclaim, "Oh, for a sapient Pautagruel, to give a 'definitive answer' in this controversy between these two Bridlegooses?" COAHOMA.

### Dutchess County Association.

THE Dutchess County Fish and Game Protective Association is no longer a proposition, it is a fact. It was organized Thursday evening, February 18, and is the result of a movement originating with the Poughkeepsie Gun Club. The officers, including some of the best known sportsmen in the county, are as follows: President, Wm. A. Adriance; Vice-President, Herman W. Marshall; Secretary, A. J. Du Bois; Treasurer, Wm. Haubenestel (treasurer of Dutchess county); Librarian, H. E. Winans. Directors—John G. Dutcher, Pawling; Isaac Tallman, Millbrook; Chas. Cline, Millerton; E. J. Preston, Amenia; Dr. Carroll, Red Hook; Geo. Lasher, Clove; Dr. Wm. Baxter, Wappingers.

An application for incorporation has been granted by Judge Dickey, of the Supreme Court. The objects are: To propagate, restore, and protect fish and game and aid in the enforcement of game laws, and further legislation beneficial to legitimate sporting, and to prevent depredations of unprincipled anglers and hunters; to establish equal rights for all, and promote good fellowship and sportsmanship generally, and collect and publish useful information relative to these objects, and create a fund, by membership and donations, to carry out the purposes of the association, and affiliate with similar organizations.

A bill will be presented to the Legislature containing several amendments to the forest, fish, and game laws to affect Dutchess county. Negotiations are now being made for the purchase of a quantity of quail for liberation within the county.

The movement resulting in the organization of a society having such splendid objects has met with the approval of the people throughout the county, and the association is receiving support of the most substantial kind. Other counties would do well to follow such a line.

SNANIWEH.

### Fox Farm a Failure.

A GENTLEMAN by the name of Skillings, of Bangor, recently started a new industry on an island off the coast between Machias and Jonesport, Me. This was fox raising. He believed that there was money to be made in raising foxes for their hides, and so leased what is known as Triton Island, some distance off the coast. Having secured the island he went west and bought about sixty of the finest furred and most hardy foxes he could find, paying for some of them as high as \$500 apiece. These

he placed on the island last fall, and started his fox farm, with every prospect that his novel plan would be a success.

Of course, the island being some distance from the land, it was impossible for the foxes to get off, and so fences were not necessary. This winter came with its cold weather, and gradually the water between Triton Island and the main land closed slowly in, until finally the wide passage was covered with thick ice which could support a man, or a team for that matter.

All this had been going on so quietly that Mr. Skillings had quite failed to think of what this rapidly forming ice might mean to his new industry, and one morning he awoke to find that every fox owned had escaped from the island to the main land, and had taken to the heavy growth of timber which covers much of this section of the coast. Mr. Skillings instituted searches, and scoured the surrounding country, but he has not succeeded in recovering one of the animals. The sixty foxes, many of which were extremely valuable, aggregated an amount of many thousands of dollars, and the loss gives every indication of being a total one.—Portland Express.

### Baron Killed by a Bear.

A PRESS dispatch from Tacoma, Wash., February 24, says that word has been received from Forest Ranger Bowine, of Solduck Hot Springs, in the Olympic Peninsula, that the body of Baron Martin von Schlosser was found on the range south of the hot springs on Monday evening. Near the body was a bear. The Baron was undoubtedly killed by a bear. He had started in the morning on a hunt.

## Meditations of an Angler

### II—Last Summer.

THIS is what they call "a regular old-fashioned winter," but, like many other "old-fashioned" things, I would much prefer to read about it, or hear the oldest inhabitant talk about it, than to mingle with it. There is nothing irregular about it. The mercury is as regular as an eight-day clock that has run down. But surely there is nothing old-fashioned in the price of fuel. That is entirely modern and up-to-date. If one could be prodigal in this latter respect and consult his bodily comfort, bidding defiance to custom and costumes and coal dealers, one can imagine a condition of affairs where winter might be made endurable. But as things are at present, I wish that I could crawl into some warm corner and go to sleep, and not be called for breakfast until old Boreas himself was *hors de combat*, and all his forces put to rout and driven back into their own realm of perpetual ice and snow somewhere in the far distant north land, wherever that may be.

At the beginning of this unending season, some vain, deluded mortal, some false prophet, some addeledated seer foretold an open, mild winter. Possessing "the faith of a little child," I believed him, and my heart was therefore glad and my flesh rejoiced. As an excuse for misleading me in such a shameless manner, he asserted that the muskrats had built thin houses this year, seemingly an uncontrovertible fact. I took his word for it. I did not consult the muskrats; but if they build according to the prophets, they must regret it, and if they perish miserably in their dens, it will only serve them right; and if my false prophet should perish along with them, it would serve him right.

Like all other prophets, however, this one does not seem a bit disturbed, nor ashamed of himself because of his erroneous prognostication. Nay, more, he even seems to take pride in the condition of the atmosphere. I met him one day on the street when the thermometer had quit work and struck for a higher scale and more heat.

"This is the coldest snap since the sixties," he cheerfully announced, as he brushed the icicles from his mustache, and the knowledge of this fact seemed to add greatly to his happiness. "You have frosted your right ear," he added, in pleased tones.

Having grown accustomed to that sort of thing, I merely grabbed up a handful of snow and applied it to the frozen member. "I thought you said we were going to have a mild winter," I reminded him.

"Did I?" said he. "Well, I don't control the weather. But I'll bet the groundhog sees his shadow when he comes out of his hole next month. You know what that means, don't you?"

As weather prophets groundhogs are no more of a success than muskrats, or men, therefore I ignored the bet—and luckily, because the woodchuck saw his shadow with a vengeance this year, as everyone knows.

Prophecy must be a satisfying occupation. If you prophesy some dire event which actually takes place according to schedule, you are the only one benefited, for you win glory and the joy of saying, "I told you so," and if the thing does not come to pass, everyone is so glad

that it did not that they forget to find fault with you; while if you make the mistake that my prophet was guilty of, you can lay it to a higher power than your own, and talk about the future. If you only prophesy enough you are bound to win occasionally.

All of which has nothing to do with last summer, so I shall turn my thoughts from boreal reflections and all things pertaining thereto, and hark back to the days that were days, when everything was as it should be, and it was good to be alive.

One has a great number of last summers to look back upon in the course of his life. Some glided smoothly by in the well worn rut of the every-day, commonplace order of things, with nothing in particular to mark their progress; and they, therefore, only go to make up the great bulk of the mediocre days of our mundane existence. So far as our cognizance of the cause and effect of human actions upon human life is concerned, these summers are as vague dreams wholly forgotten or but dimly remembered. They belong to the past and are consigned to oblivion. A few, perchance, stand out from the hazy mist of forgetfulness, illumined by the memory of some unusual occurrence—possibly some tragic event; but in a whole lifetime how few are all that they should be. Scarcely one, in truth, though sometimes it is granted us almost to attain the perfect summer we long for.

A perfect summer should be like a beautiful book—a book of golden days, and each day a poem in itself. Here and there should appear between its pages rare pictures of a glowing sunrise or a gorgeous sunset; of limpid lakes and babbling brooks; of soft rustling trees and cool shady dells, where wild flowers bloom; of the world of nature, indeed, as we see it at its best—the world that God himself created. Of course we can only dream of such a summer, but what would life be worth without the dreaming?

Last summer was not quite such a perfect summer for me, but there were days and days, and many of them worthy to occupy a prominent place in this book of "golden days." For that reason it will always remain in cherished seclusion in a niche by itself, apart from other summers, even those that have some claim for recognition in Memory's sacred temple. There were no thrilling adventures to make it memorable, no hairbreadth escapes, no fierce struggles with warring tribes or ravening beasts of prey; it was all as quiet and peaceful and serene as a perfect day in June, and I doubt if I shall ever have just such another summer.

Near the place which I at present call my home, there are numerous lakes and much good fishing. Within a radius of ten or twelve miles there are also several trout streams known only to the initiated—those of the innermost circle. Two of us claim possession of these streams by right of discovery. We have maintained our title—it grieves me to confess it—"with lying lips and deceitful tongue."

But what is one to do? If people will get curious and ask embarrassing questions about such matters, surely an evasive answer were better than a retort discourteous. Verily, "a soft answer turneth away wrath," and also an inquisitive angler from your private trout stream.

To me belongs the glory of having discovered one of these streams, and to me befell the joy of landing a

dozen or more lunkers when I first wet my line in its waters. I mention this discovery first, because it marks an epoch in my angling life. Previous to that time I had confined my piscatorial efforts in this locality to bass and other lake fish. One day Dame Rumor whispered in my ear that somebody had told her that somebody had told somebody else, and so on, that trout had been caught in this stream years before; so I hitched up my gallant pony and drove out there, more on an experimental tour than anything else.

The farm hands at the farm where I left my horse grinned pityingly at one another and at me when I explained my errand, and made cumbersome jokes at my expense. But I assumed my most dignified air—which obviously produced not the slightest effect—and stalked down to the stream.

It was a small, unpretentious brook, and did not look very trouty upon first inspection. There was a stretch of boggy marsh between the dry land and the bank of the brook, and as I was not prepared for wading, I was uncertain how to proceed. After many half-hearted attempts, and after slipping from one or two hummocks—a most aggravating thing to do—and getting my feet sufficiently wet, my anger came to my assistance, and I boldly waded across, a thing I should have done in the first place, as I might well have known. I ought to mention the mosquitoes right here, but I refrain—something which they did not do.

I found a likely looking spot, where the water-cress grew under some overhanging willows, and cast in. The trout were there waiting for me. My shout of triumph; as the first one lay flopping on the grass, betrayed my presence to all the other mosquitoes in the neighborhood, not to mention myriads of gnats.

The fading light and the voracious insects finally compelled me to reel up my line and start for home. I strung my trout on a willow switch, and with swelling breast and a swollen face fought my way back to the farmhouse. Before I got there a bull appeared from somewhere and barred my way. But I paid no attention to him. I merely left him there, tossing sod in the air and bellowing, circled a twenty-acre field, and gained the barnyard by another route. Ordinarily I should have been nervous, but just then victory crowned my swollen brow, and bulls had no terror for me. Doubtless I should have circled a forty-acre field with the same glad indifference had the occasion demanded the circle.

A forlorn looking thin woman came to the door and informed me that the folks had all gone to prayer meetin' or a dance, she didn't know which. I was glad, because, although it would have done me good to boast somewhat, it was not necessary for anyone to know about the trout.

A friend of mine had that failing—I mean of boasting about a catch of fish. It was impossible for him to keep from displaying a good string of trout, and, of course, it was impossible for him to keep from lying about where he caught them. One day an envious friend of his came to him in private, and said:

"See here, John, you might tell me where you caught those trout. I'll swear not to give it away to any of the boys."

"Oh, I don't mind telling you," John replied. "It was about five miles west of here." You see, plenty of prat-

tice had quickened his tongue, and evasion had become second nature when trout streams were mentioned.

"You don't mean that stream on the Bascom farm, do you?" his incredulous friend asked in amazement.

"The very one," was John's unblushing reply, "only don't tell anybody else." And he turned away to hide a smile.

"Why, I have crossed that stream a hundred times," his friend declared, "and I never imagined there were trout there."

"That's where I get most of mine," John assured him. "If you catch any at all they will be lunkers."

"I'll try it to-morrow," said his friend, "and I'll promise to keep it dark."

Now, John knew no more about the whereabouts of Bascom's farm than he knew of the whereabouts of Bascom's ancestors, therefore he gloated over his wily ruse in private, and finally, as a great mark of favor, let me into the joke.

The next morning John's friend returned. His basket was full of speckled trout, full to overflowing, and the tale thereof numbered one score and ten, and the weight thereof was twenty-four pounds.

Think of John.

Of course I visited my brook many times that summer, but my first catch was the only one worth talking about, and I gave it up at last and concluded that there were no more trout to be caught.

That was several years ago. Last summer a friend with whom I do most of my fishing and I were out on a jaunt one day, and as usual we put our rods in the cart, from force of habit. On the way home our road crossed this brook of mine, and I suggested, half seriously, that we stop and try our luck. We had no flies with us, but we managed to find a few small angleworms.

My friend was very dubious, and I myself not exactly sanguine of good results. And that only made the outcome more enjoyable, for we carried home as fine a string of trout as you would care to look upon.

We held a feast that night all by ourselves, and we waxed eloquent, and possibly a trifle bibulous as we gloated over our spoils; and the memory of it all will last so long as memory shall endure.

Of all the streams that we have fished hereabouts, there is one which holds the first place in our affections. It is called Token Creek, but, as the "White Knight" would say, that is not its name, it is only called Token Creek. Its real name is—well, it matters not just what it is. It is a branch of Token Creek, and that is as much as we ever tell anybody.

A man once had a private trout pond on the main stream, and one spring the dam washed away, and the trout went with it. That happened ten years ago. Two or three years ago we learned that a few trout had been caught in one of the branches of Token Creek, and we forthwith decided that it behooved us to investigate.

Until you have eaten a Token Creek trout, you will never know what it is to eat a trout. Were I a gastronome I could sing the praises of one of these fishes ad infinitum. As it is, the mere thought of them makes me hungry. How I wish that the good Sir Walter could have fished this stream. I can imagine the look of quiet joy that would have suffused his benign countenance when one of those big two-pounders yielded himself up after a gallant struggle. And then he would have launched forth into a careful dissertation, addressed to his willing scholar, upon the rare merits of this particular trout, and the best way to prepare him for the table.

Truly in delicacy of flavor and perfection of condition, a Token Creek trout surpasseth any fish in this part of the world. We never catch many at any one time, but what we do land are worth traveling miles to obtain.

And then there is a Charlie who owns the farm where we fish. Charlie is not precisely overburdened with honesty, nor with the energetic push—the overworked strenuousness of the twentieth century—but he has his points, such as they are.

When we first met him we had just finished our evening's fishing, and were getting our rods and things together. It was the quiet hour between twilight and dusk. We were seated on a sort of knoll on the bank of the stream. Almost at our feet lay the broad pool where we had landed our last trout. There was a moon that night, and every ripple in the pool gleamed and scintillated in its soft light. Occasionally a loud splash sounded in our ears, reminding us that there were big trout still left in our stream, and we would half start to our feet with a glance at one another, each waiting for the other to suggest that we try them again.

Upon this restful scene sauntered Charlie with a lantern on his arm. He seated himself beside us, and proceeded to interrupt our train of thought. He started out by informing us that he knew nothing about trout fishing, and cared less.

"Give me a bullhead or a sucker every time, b'gad," said he.

He spoke in a rapid, jerky manner, and interspersed his conversation with many and frequent "b'gads," as we soon learned. He talked on general subjects for a time, but soon drifted around to personalities.

"Be any of you married?" he inquired.

I alone pleaded not guilty.

"Ain't you?" he asked in envious tones. "Well, I didn't used to be, but I am now, b'gad. She's young yet, only fifteen, but I treat her right. Didn't s'pose I ever would get married a month ago, but I done it, b'gad. She ain't the gal I picked out, neither. No, boys, I was in love once. I don't look it, do I? But I was, b'gad. Like to hear about it?"

Of course we gave him all the encouragement he desired.

"Well, then, boys," he went on, "I'll tell you the history of my life, short 's 'tis, b'gad. I loved a gal once, and she was a corker. Can't describe her, but she was a winner, let me tell you. I courted her for all I was worth, b'gad. Wore out three buggies on her, b'gad. Took her to dances, took her to everything, and she ended up by throwing me down, b'gad. Got mad at me, and me at her, and 'twas all off. You might say the devil was to pay on Token Creek, b'gad."

"Met her in the road one day afterwards. My heart said speak to her, my head said don't speak to her. Fol-

lered my head, b'gad, and didn't, though she looked anxious. Wish I had now. Went to a dance one night. Drove six miles to get there. Knew she'd be there, and she was, b'gad. Went into the hall, and there she was. I went cold all over, then I went hot, just like chills and fever, b'gad. She finished a dance with another feller just as I came in. My heart said go up and speak to her, my head said don't. Follered my head, and went out, b'gad, and that's the last chance I got. And I wore out three buggies on her, b'gad. That's the hist'ry of my life, short 's 'tis."

"What became of the girl?" one of us managed to inquire.

"Married another feller," he replied. "She'd rather had me, though. 'Tother feller was stingy as a mink. No style to him at all. Never owned a buggy in his life till he got married, and I wore out three on that gal, b'gad. You see I was putting on style them days. Got some stuck on myself, I s'pose. That's why I follered my head when I ought to have follered my heart. Tell you, boys, this here gettin' stuck on yourself don't pay no dividends, b'gad."

We agreed with him, and nothing save the lateness of the hour and the long drive home kept us from hearing more of Charlie's "hist'ry of his life" that evening. It all came later—but of that, more anon, as the story writer puts it.

If I were to write a complete history of last summer the narrative would fill a book. When one gets started talking about such things, one is apt to go weaving along indefinitely. It is fun for the weaver, and that is all we are sure about.

Many summers have passed, and other summers are in store for me, I hope, but last summer can never come again. The wine has been drunk, and naught but the empty goblet remains; but a fragrant aroma still clings to the goblet. I shall place this goblet in some corner by itself, and pray that it may be my good fortune to drain other goblets worthy to take their place beside this one, upon whose face these words are deep engraven: "Sacred to the memory of Last Summer."

FAYETTE DURLIN.

## Fish Chat.

BY EDWARD A. SAMUELS.

### Concerning the Smelt.

SECOND cousin to the grayling and trout, and one of the neatest, most graceful, and delicate of all our food fishes, is that universal favorite, the smelt.

I say universal favorite, for such it is, being generally distributed along the Atlantic Coast, from the latitude of New York to Prince Edward Island and the St. Lawrence River. That its value as a table delicacy is fully appreciated, is shown by the generous supply of the little beauties that may always be found in our markets in the proper season, but an idea of the enormous quantities that are consumed can hardly be formed by those who have not given the matter more than a passing thought.

The numbers of these beautiful little fish which are found along our eastern Atlantic shores, are inconceivably great, in some localities, when the smelt are about to ascend the rivers and streams for the purpose of depositing their spawn, the water seeming literally to be alive with them; in fact, I have seen brooks which they were ascending that appeared to be almost a solid mass of struggling fish. They appear to have favorite localities for spawning, and visit the same brooks and streams year after year. For example, there is a brook of rather insignificant size, called the Milton Brook, which empties into Dorchester Bay, Mass., that has been visited by them in prodigious numbers from time immemorial, and the aquatic grasses and weeds which abound in the brook are covered with the spawn that has been cast.

There is another brook of even smaller size in Quincy, Mass., which in places seems almost filled with the spawn that has been deposited; there are several smaller streams which empty into the Weymouth Fore River that are visited by myriads of these fishes in the spawning season.

Along the Massachusetts coast and thence north and east the fish enter the brooks and small streams in immense numbers. The spawning season varies with the degree of latitude, beginning almost with the breaking up of the ice in very early spring in Massachusetts, and becoming later in Maine and Nova Scotia, the fish entering the streams that empty into Margarets Bay, N. S., early in May, while in the rivers which flow into the Bay Chaleur quite late in that month, incredible numbers ascend the Jacquet and other rivers as late as May 20 or 25.

Some idea of their abundance at this period may be had when I state that they are or were netted by the hundreds of barrels full and used by the farmers on the bay shore for manure; this was the case a number of years ago, but I believe the practice of using them in this manner has been abandoned for the more profitable one of packing them in cases and shipping them to the great markets of this country. This business has become large, important and lucrative one; many packing stations having sprung up on the coast of Maine and the Maritime Provinces. I have before me a clipping from a St. John paper, which contains a communication from Richibucto, N. B., that shows how important the smelt packing industry has become in that place, which is one of many that are scattered along the shores of the bay. It reads as follows:

"The smelt-fishing season, which opened yesterday, is the biggest thing in this part of the country. Although it is carried on but a little over two months in every twelve, it does more real good in that time than all the other industries put together can do in a whole year. The secret of its beneficial effect is found in the system by which the business is conducted. Other kinds of fishing, lumbering and such things are nearly all done by due bill method, but the man who attempts to take a hand in buying smelts without the cash on the spot, is not in it! Long before daylight, yesterday morning, dozens of nets were out all over the river

and in the small streams for the purpose of holding places until the ice makes the fisherman run some risks by this work; as at former seasons many nets have been taken away and lost by drifting ice, or by storms breaking up the ice after it was supposed to have formed sufficiently strong.

"Following the catching of the fish comes the preparation of them for market. It is nothing unusual for small boys to earn from a dollar to a dollar and a half a day packing the smelts in boxes. No matter in what way you are connected with the work it is cash. Forty or fifty thousand dollars emptied out within a radius of ten miles in a few months, means something, and the man or woman who cannot talk about smelts from now until the middle of February, is of no use in this vicinity."

The net used in seining the smelts is pretty close meshed, of course, and is large enough to inclose several thousand pounds at a haul; the struggles of the fishes as the folds of the net encompass them more and more closely, together with the weight of the captives as they become compact, forces the spawn from them, and that to such an extent, that I have seen the beach where the seining was done covered with the eggs in winrows looking like so much sawdust.

Although properly a marine species entering the fresh water streams solely for the purpose of spawning, the smelt thrives perfectly if it makes its home in fresh water the whole year. I have somewhere seen it stated that the landlocked smelts are even a greater delicacy than those which return to the sea. This may be the case, but I have my doubts, for the reason that those which remain in the fresh water are obliged to subsist mostly on minnows and other small fishes, while those which obtain their food in the salt water consisting as it does of shrimps and other crustaceans, and a great variety of piquant marine creatures, must attain a flavor and plumpness that the others cannot possibly have.

The smelt has been planted in a number of the Maine lakes, which have been stocked with landlocked salmon, and the Fish Commissioners of that State are of the opinion that they are indispensable as food for the salmon; those fish growing and thriving only in waters into which the smelt have been introduced. At all stages of their existence the smelts furnish food to the salmon even when they both are in the fry period.

Hon. Henry O. Stanley, in speaking of this fact says: "I have no doubt in many of our inland lakes there is a lack of suitable food, more especially for the younger fry, also affecting their growth as they advance in life. I believe many of the newly hatched fish starve for lack of suitable food. Those that do survive are apt to be stunted and do not grow to be handsome fish. The smelt hatches at about the time the young salmon begin to feed, and is so small they readily swallow him. They are as eager after him as a cat is after a mouse. I have dipped them in a pail of water, turned them in our hatching troughs with young salmon. They would hunt them until they caught the last one."

It is not in the fresh water alone that the smelt furnishes food for the salmon, for in the ocean that little fish, together with its near relative the capelin, sand-lance and the herring, provide no small proportion of the food for that fish, instances being on record of salmon having been caught on trawls baited with herring in twenty fathoms of water at George's Banks and elsewhere, and the stomachs of fish taken in gill nets along the shore have often been found to contain smelts and capelin.

While there is only one variety of the smelt on our coast there seems to be a considerable difference in size and coloration in different localities; in the general run of the fish their length does not average much over six inches, and the color is usually of a brownish green on the back and silvery on the sides, but sometimes in a day's catch there will be quite a number of larger and more highly colored fish.

At Salem, Mass., it is or was a common thing to take smelts averaging ten inches in length; their backs were almost bright green, and their sides were beautifully iridescent, changing from pearly white to pinks, lilacs and almost purple. I never saw such highly colored fish elsewhere, except at Prince Edward Island, and the size of the fish there exceeded any I have seen at any other point. I found these smelts to be rather abundant at Malpeque. I was standing on the bridge which spans the river at that place one morning, when, on looking down into the water which was almost as clear as crystal, I discovered a number of fish darting about near the piles of the bridge, which I supposed at the time to be sea trout. On returning to the house where I was stopping, and inquiring concerning their identity, I was informed that they were probably smelts, and that if I had a mind to try for them with angle worms for bait I might get a mess.

Acting on this suggestion I rigged up a bait rod and line, and with a good supply of worms, went down to the bridge again and threw in my hook; it was quickly seized, and I soon landed a smelt that was fully a foot in length, and most beautifully colored. The cucumber odor that the smelt always exhales was present in this fish in a remarkable degree; and when I had caught a couple of dozen of the silvery beauties the odor from my creel was decidedly pronounced. These fish were in prime condition, and when served at the table were absolutely delicious.

Smelts in harbors along the New England coast furnish recreation to a large number of anglers in the autumn and winter months, the bait used before ice forms consists usually of shrimps and minnows, preferably the former, but when the surface of the water freezes and the ice becomes thick, and strong enough to bear the fishermen, holes are cut in it and the anglers behind huts and other shelters from the wind, find lucrative employment in smelting, the bait used being shrimps or minnows, if they can be obtained, pieces of meat, from a frog's leg, sand worms, and bits of fresh beef, the fresh caught fish usually commanding a price at least double that obtained for those which have been frozen and packed. When the smelt fishing season is at its height, ten or fifteen dozen often constitute a day's catch.

# An Experiment in Cooking.

(From the Log of Camp Nessmuk.)

AFTER talking it over and over during the winter and early spring, with various suggestions gratuitously thrown in by the wives of the married members and the friends of the unmarried, it was mutually agreed that the menu of camp could, to good purpose, be extended beyond the range of fish, eggs, potatoes, and bread.

Why not have hot griddle cakes—surely they would be enjoyable, and an omelette is easy, very.

After much discussion it resolved itself into Emerson volunteering an omelette and "Pap" proffering hot cakes.

Throughout May and June, as we walked home after the day's work was done, Emerson would go over his omelette (he was studying Mrs. Rorer, and had it down fine), "Six eggs, a lump of butter the size of a hulled walnut, twelve shakes, and let her set." I soon felt almost equal to an omelette myself.

"Pap" obtained his recipe from his wife, and jotted down what he considered essentials; but, alas! that cooks are born and not bred of recipes and cook books.

Arriving at Camp Nessmuk, we were all in high expectation of the good things in store as we each day heard the recipe for omelette—"Six eggs, a lump of butter the size of a hulled walnut, twelve shakes, and let her set." It seemed the consensus of opinion that the feast should be postponed until Friday evening, when we would have a rogal spread for the last supper.

It started well. "Pap" retired behind the tent, and for the last of many times intently perused his recipe. He carefully measured into the water bucket a quart of flour, two tablespoonfuls of baking powder—Royal is the best—which his wife had kindly provided, sent Ruffy to the farmhouse for a quart of milk, and then broke an egg into the flour, a second and a third. I gazed into the bucket, smiled grimly, and said—nothing. The moment he began stirring the eggs and flour together, "Pap" discovered his blunder; the eggs and flour made lumps, which he attempted to thin out with milk. First one quart, then another quart; next three more eggs—more lumps; but it really looked rich; anyhow, it was too late to change it.

We had no griddle to bake 'em on, so we used the skillet, the one *sine qua non* of a camping party. What can't you do in a skillet—cook, bake, fry, boil, and stew; its uses are multitudinous.

The skillet being properly heated and greased, to prevent 'em from sticking, "Pap" held the tin cup aloft and the batter slowly dropped into the waiting pan—a little thick it was and lumpy, and, to be sure, it would not spread thin and round as it should, in spite of the two quarts of milk, but "Pap" cut the Gordian knot by spreading it round with the bottom of the tin cup. I don't want to be understood as holding that the cake was round, for it had no exact geometrical shape, but I may say this for it, it had fringes round the edges. When it looked as though the obverse side might be sufficiently roasted, fried, or baked, "Pap" attempted to flop it over to give the other side a show; but the sides of the skillet were rather high, the cake occupying the greater part of the bottom, leaving but a small margin, it was impossible to get the necessary leverage on the cake. A fisherman is necessarily a man of resources, and "Pap" soon found a way to turn the refractory slap-jack. But by this time its usefulness and beauty had departed, so it was reluctantly heaved over the bank, against the loud protests of George and Emerson.

As "Pap" poured the batter, "Pard" sat upon the edge of the improvised stove and placed lumps of golden butter on the hot cakes. They baked the cakes and roasted themselves until the batter was exhausted, and the tin plate was piled high with an assortment of sizes, shapes, and browns such as the sun, just sinking behind the mountain peak, looked upon but the nonce, then winked and smiled as he sank to rest.

While "Pap" and "Pard" were engaged with the pancakes, Emerson was working out his omelette, demonstrating the beauties of cook-book cookery, exemplifying that all that is requisite to make a *chef* is Mrs. Rorer's Cook Book. Into the skillet he broke six eggs, placed therein a lump of butter size of a hulled walnut, and began on the twelve shakes, but for some unexplained and unexplainable reason it did not "set." Undiscouraged, he gave it a good baker's dozen more vigorous shakes. It seemed all right at bottom, but the top was not inclined to play fair, and would not do the "set" act. Finally it was declared done—probably a little overdone on the bottom, but good, of course. As the omelette required but one baking and the cakes had to be done one at a time, two sides at that, the omelette was ready long before the cakes, so was given a neutral place on the stove to await the baking of the cakes.

"All ready," we fell to, the assault led by "Pard," the omelette being carefully divided into six segments, and the cakes duly distributed. Each, as he munched his lumpy pancake and battery omelette, kept up a terrible thinking, but wisely said nothing, until Emerson broke the ominous silence with a word as to the goodness of the slap-jacks, when George chimed in with a "me, too," and bespoke the excellence of the omelette, which disappeared in due course, and the last cake was divided among George, Ruffy, and "Pard." The famous last supper was a pronounced success; and the pancakes and the omelette were spoken of with respect.

But by and by a change came over the spirit of "Pard's" dreams; he began to feel a depressing weight at the pit of his stomach, and as the night wore on had a terrible tussle with those flap-jacks. "Pap" began to fear that "Pard" had, indeed, eaten his last supper. "Pard" did not die; one can survive much when out for an outing.

The experiment was voted a success; and, with the knowledge of experience, and the advice so freely offered upon our return home, when we modestly told of the lumpy batter and the battery omelette, we felt confident that another year we could easily avoid the shoals and rocks upon which we had so nearly wrecked.

The following summer it was decided to have the big supper on Thursday evening, as Emerson and George must leave next morning before breakfast on their long tramp of nine miles over the mountain to catch the early

train for home. Preparations began at 5 P. M. "Pap" mixed his batter in good form, Emerson broke a round dozen of eggs into the skillet, beat them into a foamy mass, added the butter, and began to shake. He shook and shook. While the bottom burned, the pesky top refused to "set."

"Pap" and "Pard" baked the cakes, which, with the perverseness of some things, refused to assume the autumnal browns so becoming to griddle cakes. When the omelette was scorched well toward the middle and fairly dry on top, it was placed upon the table and the feast began. Inadvertently I tossed my segment of omelette to the white dog, who stood expectantly near; as he grabbed it, George raised a howl about "some people not knowing a good thing when they saw it," but in the midst of his harangue, the dog dropped the omelette and his tail in the same instant, and lit out for home like a sheep-killing dog caught in the act, very much to the disgust of George and Emerson, and the merriment of the others. Acting together as with a single thought, the others, except George, who proved faithful to the last bitter bite, heaved their portions over their shoulders. The pancakes seemed to lose their wonted flavor, and the last one remained undivided on the tin plate.

WM. WALTERS CHAMPION.

WILLIAMSPORT, Pa.

## Fish and Fishing.

### American Fishermen and the Canadian Courts.

Two decisions have been rendered by Canadian law courts within the last few days, which possess considerable interest for American anglers. One of these is in favor of the Provincial Government of Quebec, and is destined to have a most important bearing upon the whole question of riparian rights, unless it should be reversed by the Imperial Privy Council, to which, I am informed, that it is very likely to go, in consequence of the large interests at stake. The action was taken by the Attorney-General of Quebec against Alexander Fraser et al. Fraser, some years ago, acquired the land upon both sides of the Moisie River fronting upon its famous salmon pools opposite the American camp, sixteen miles from its mouth, and always believed that the ownership of this property carried with it the exclusive right of fishing the river opposite the lands in question. Acting upon this presumption, he has leased the angling in the river for many years past, and some time ago signed a promise of sale of the property for \$45,000. Supporting itself upon the judgment of the Privy Council, to the effect that the fishing in all navigable and floatable waters of the Dominion is the property of the Provinces, the Government of Quebec laid claim to that of the Moisie, and in the month of December, 1902, leased the angling of the Moisie, for \$2,500 a year, to Mr. Vesey Boswell, of Quebec. Fraser and his tenant resisted the right of Boswell and friends to fish the Moisie, and fished it themselves during the last two years, their contention being that the Moisie was neither a navigable nor a floatable river, nor yet affected by the tides, particularly at or near its salmon pools. The judge, in maintaining the action of the Government, remarked that it had been sufficiently proved that from the foot of the rapid at the Grand Portage to the mouth of the river, a distance of seventeen miles, the Moisie was both a navigable and a floatable river, and consequently belonged to the public domain, from which it could not be taken without the permission of the Government, and that in the meantime the angling was the property of the Crown. Of course, the whole matter hinges upon what constitutes a navigable river. Nearly all the salmon waters in this country are upon rivers which are more or less navigable for canoes, and if this is to be taken as sufficient ground for declaring the Crown to be the proprietor of the fishing, it is altogether likely that the Government of the Province will lay claim to salmon fishing for which thousands and thousands of dollars have been paid out in good faith by American fishermen. This is one of the reasons why the recent decision is of such far-reaching importance, both to the Government and to fishermen, and why it is assumed that appeals will be taken from the present decision through all the intermediate courts until a final and definitive pronouncement is obtained from the Imperial Privy Council.

### American Proxies and Canadian Clubs.

When the constitution and by-laws of fish and game clubs incorporated under the Canadian law are silent as to the right of absent members to vote by proxy at the meetings of such club, it has been laid down by the Court of Appeals that the provisions of the general law of the Province prevail, and such provisions permit the voting by ballot. This question was raised some time ago in the case of the St. Bernard Fish and Game Club, where the president ruled that proxies should be counted, but was overruled by the majority of those present at the meeting, who held that the power to elect the club's officers rested with the majority of those present at the annual meeting. The result was that each of the contending parties claimed the election of a different set (in part) of officers, and one party took a writ to oust the other. The president's party, which voted the proxies, was sustained by the court of first instance, and now that decision has been confirmed by the Provincial Court of Appeal, which was asked to reverse it. American members of clubs holding their meetings in Canada for the election of officers would do well to take a note of this decision. Among those whose proxies were produced at the contested meeting were such well-known sportsmen as Brent Good, John L. Bacon, L. D. Boynton, Joseph G. Brown, H. M. Cutler, Augustus Dowdell, Chas. J. Glidden, H. G. Howe, F. A. Howland, C. R. Jamieson, W. W. Knight, W. A. Root, William N. Mann, C. C. Putnam, and J. C. Warren. I have already intimated in this column that it might avoid much trouble were all American clubs incorporated under Canadian laws to state definitely in their by-laws whether or not members could vote by proxy, but where this is not done, the present judgment of the Court of Appeals will apply, and proxies will undoubtedly be declared legal.

E. T. D. CHAMBERS.

## Albany Legislation.

ALBANY, N. Y., Feb. 29.—The following additional bills amending the game law have been introduced in the Legislature: Assemblyman Matthews' (Int. No. 687), amending Section 44 so as to provide that the close season for lake trout shall be from Oct. 1 to April 15, both inclusive, instead of from April 30. Assemblyman Stevens' (Int. No. 709), amending Section 41, so as to provide that the close season for trout in White Creek in the towns of Hoosick and White Creek, Rensselaer and Washington counties, shall be from Sept. 1 to April 30, both inclusive. Senator E. R. Brown's (Int. No. 473), amending Sections 30 and 108, so as to provide that the close season for English snipe, yellowlegs, plover and shore birds shall be from Jan. 1 to Sept. 15, instead of from May 1 to Aug. 31, and that they shall not be taken nor possessed from Jan. 1 to July 15, instead of June 30. Assemblyman G. H. Whitney (Int. No. 741), amending Section 9, so as to provide that perch shall not be taken in Saratoga county from Feb. 1 to May 1, both inclusive. Senator E. R. Brown's (Int. No. 472), providing a method for acquiring land and water for State fish hatchery purposes. Senator Armstrong's (Int. No. 475), amending Section 103 by striking out the words "trout shall not be taken or possessed from May 1 to Sept. 30, both inclusive, or taken in the night between sunset and daylight."

The Assembly has passed the following bills: Assemblyman Bedell's (Int. No. 556, Pr. No. 753), amending Section 26 so as to strike out the provision that grouse shall not be taken in Orange county from Dec. 1 to Oct. 15, both inclusive. Assemblyman Coutant's (Int. No. 389, Pr. No. 666), amending Section 59a so as to allow the use of tip-ups and set-lines in fishing through the ice in Ulster, Washington and Cortland counties. Assemblyman Dickinson's (Int. No. 160, Pr. No. 664), amending Sections 13, 15 and 41 so as to provide that the close season for hares and rabbits in Cortland county shall be from Dec. 1 to Sept. 15; for mink, skunk, muskrat and foxes, from May 1 to Oct. 31, and for trout from July 16 to April 15, all inclusive. The Assembly has advanced to third reading Assemblyman Coutant's bill (Int. No. 390, Pr. No. 416) amending Section 27b so as to make the close season for grouse, woodcock and quail in Ulster county from Dec. 16 to Oct. 15, both inclusive. The Assembly Committee on Fisheries and Game has reported Assemblyman Hanford's bill (Int. No. 608, Pr. No. 639) to allow the taking through the ice with hook and line or tip-ups of bullheads, catfish, cels, perch and sunfish in Cayuta Creek and its tributaries, and the Susquehanna River and its tributaries in Tioga county, but forbidding such fishing in Queechey Lake. Assemblyman F. C. Wood has introduced a bill (Int. No. 792) amending Section 14 so as to provide that no trap, snare, pit, deadfall or other device to entrap or entice beaver shall be made, set or used. The Fish, Forest and Game Commission may acquire by gift, purchase or capture a sufficient number of wild beaver to restock the Adirondack region. A penalty of \$100 shall be inflicted for a violation of this section.

## Fly-Casting at the Show.

THE scores in the fly-casting competitions at the Sportsmen's Exhibition, Madison Square Garden, up to Tuesday, March 1, are as follows. The tournament will close to-night. The complete scores will be given in our next issue. For conditions, see FOREST AND STREAM of Feb. 13:

Class A—Trout fly-casting for distance only; open to youths not over twenty years of age:

Feet.	Feet.
H. G. Henderson, Jr.....56½	R. F. Cruikshank.....67

Class B—Trout fly-casting contest for distance only; open to those who have never cast more than 60 feet in any single-hand, club or tournament contest:

Feet.	Feet.
Arthur Gotthold.....69 2-3	C. R. Woodward.....62 3-4
W. Walter.....65	M. H. Smith.....56

Class C—Switch trout fly-casting contest; distance only:

Feet.	Feet.
D. Brandreth.....64	D. T. Abercrombie.....53 3-4
V. R. Grimwood.....61 1-2	A. B. Dougless.....54
R. F. Cruikshank.....73	L. S. Darling.....72

Class D—Single-handed bait-casting contest; distance only:

Feet.	Feet.
Victor Grimwood.....90 3-4	David Abercrombie.....78
Wolf Walters.....100 1-2	C. M. Luckey.....102 1-3
E. Mills.....85 1-3	Harold G. Henderson.....65 5-12
Hiram Hawes.....117	Milton H. Smith.....54
L. S. Darling.....85	

Class E—Black bass fly-casting contest; distance only to count:

Feet.	Feet.
W. Walters.....72	D. T. Kennedy.....70 1-2
D. W. Cloyes.....80	W. T. Morrison.....67
V. R. Greenwood.....71	H. G. Henderson, Sr.....70
A. F. Gotthold.....72	J. H. Cruikshank.....77 3-4
W. K. Park.....69	R. F. Cruikshank.....79 1-2

Class F—Light trout fly-rod contest; distance only:

Feet.	Feet.
H. D. Brandreth.....65 3-4	C. R. Woodward.....63
H. G. Henderson.....67	W. Walter.....62

Class G—Switch trout fly-casting contest; distance only:

Feet.	Feet.
R. C. Leonard.....95	L. S. Darling.....69 1-2
H. W. Hawes.....90	D. T. Abercrombie.....54

Class H—Light trout fly-casting contest; distance only:

Feet.	Feet.
C. G. Levison.....74	H. G. Henderson, Sr.....69
J. H. Cruikshank.....71 1-3	D. T. Kennedy.....51 3-4
W. H. Hammett.....66 1-6	

Class I—Light rod trout fly-casting contest; distance only:

Feet.	Feet.
W. H. Hammett.....65 1-2	W. T. Morrison.....63 5-12
W. D. Cloyes.....79 1-2	J. H. Cruikshank.....73 1-2
R. B. Lawrence.....65	

Class J—Trout fly-casting contest; forward obstacle; distance only:

Feet.	Feet.
W. H. Hammett.....54 3-4	H. G. Henderson.....52
C. G. Levison.....60 1-2	T. E. Batten.....57 1-4
D. T. Abercrombie.....53	D. Brandreth.....56
L. S. Darling.....57	A. B. Douglass.....61

Class K—Black bass fly-casting contest; distance only:

Feet.	Feet.
W. H. Hammett.....71 5-12	L. S. Darling.....81 5-6
A. F. Gotthold.....64 1-4	E. H. Fitch.....64 1-4
A. B. Douglass.....66	D. T. Abercrombie.....72 1-3

Class L—Bait-casting contest; distance only:

Feet.	Feet.
D. Brandreth.....93	M. Culhane.....86
A. J. Marsh.....85	D. T. Abercrombie.....88 1-2
W. H. Smith.....71	L. S. Darling.....92 3-4

Class M—Single-handed bait-casting contest for distance and accuracy:

Av. Ft.	Av. Ft.
E. Mills.....139 7-12	M. H. Smith.....124 1-3
C. M. Luckey.....125 2-3	D. T. Abercrombie.....77 1-12

Class N—Contest for accuracy:

Total.	Total.
D. T. Abercrombie.....12	D. T. Kennedy.....8
W. H. Hammett.....8	G. M. D. La Branche.....20
D. Brandreth.....12	D. Brandreth (Tie).....12
F. M. Spigle.....24	D. T. Abercrombie (Tie).....8

Class O—Light trout fly-casting contest; distance only:

Feet.	Feet.
E. J. Mills.....79 1-3	L. S. Darling.....65 2-3
W. H. Hammett.....65 5-12	C. G. Levison.....75 1-2
W. D. Cloyes.....73 1-3	G. Poye.....Withdraw.

Class P—Trout fly-casting contest; for accuracy only:

Score.	Score.
D. B. Brandreth.....99.47	D. Abercrombie.....99.20
L. S. Darling.....99.60	D. T. Kennedy.....99
R. C. Leonard.....99.94	F. M. Spigle.....90.20
W. H. Hammett.....88.94	E. Mills.....99.26

Class Q—Light rod trout fly-casting contest; distance only:

Feet.	Feet.
R. Leonard.....88 3-4	L. S. Darling.....79
D. T. Abercrombie.....71 1-3	

## Cruise of the Yawl Nerine.

The Story of a Cruise from New Rochelle, N. Y., to Marblehead, Mass., and Return.

BY SANDFORD G. ETHERINGTON, NEW YORK CITY.

(Continued from page 172.)

July 13, Monday, which was cold and raw, was spent ashore visiting friends, and we left at ten on Tuesday morning for Hyannisport, drawing the course from Edgartown Light to Succoneset Lightship, N. N. E.  $\frac{3}{4}$  E. Reaching over in a light westerly breeze, we sighted the vessel about noon, and, sailing to within a mile of it, kept off and steered about N. E. by E. for Hyannisport Breakwater. The breeze by this time had freshened so much that we had lowered the mainsail and ran along under jib and jigger, this proving to us once more the beauty of a yawl rig. Keeping a sharp eye on the surrounding buoys and on the chart, we rounded up behind the breakwater and dropped the hook. All hands adjourned to the shore for dinner with friends, and put back to the boat early in the evening, so as to be ready for the trip around the Cape next day.

The best anchorage in Hyannisport is directly behind the eastern end of the breakwater, just far enough off to give room to swing.

Just as the clock struck four bells, I awoke and put my head through the hatch to have a look at the weather. All the stars were out, a strong south wind was whistling through the rigging, and everything looked fine. I went below, woke up the rest, and while Rudolf was making coffee we hoisted main and jigger and shortened the cable. At 2:30 we broke out the anchor, hoisted the jib, and started on a close reach to Bishop's and Clerk's. As soon as we got out from under the lee of the breakwater the full force of the wind struck us. The lee rail had a foot of solid water over it, and the spray flew in showers as we cut through the short swell.

Running a mile or so past the light, we started sheets and steered S. E.  $\frac{1}{2}$  E. for Handkerchief Lightship. It kept growing lighter and lighter over in the east, and soon the yellow rim of the sun pushed up over the horizon and daylight came. There is absolutely nothing, to my mind, that can equal the exhilarating beauty of a sunrise on the water. To see the dark lines of the land gradually take shape with the growing light, and the water begin to sparkle and dance in the first rays of the sun is a sight that, once seen, can never be forgotten.

Shave noticed that the dinghy was rather low in the water, and, on pulling it up, we were surprised to find it half full from the spray that had been kicked up on the reach out. We bailed her and dropped her astern again. By this time breakfast was ready, and Rudolf took the tiller while we went below to eat. Just as we were finishing, Rudolf made out Handkerchief, and as we came up to it, one of the Maine steamers passed us, with decks deserted in the early morning.

After carefully looking the charts over and noting the depth of water between Handkerchief and Pollock Rip, we decided that it would be safe to cut straight across instead of taking the regular steamship channel around by Shovel. So we steered E. by N., and about nine o'clock passed Pollock Rip Lightship. For a time we were in sight of three lightships—rather an unusual occurrence.

The course from Pollock Rip to Pollock Rip Shoals is N. by E.  $\frac{3}{4}$  E., and with the wind abeam, and growing lighter and lighter, we reached along and finally passed the Shoals Lightship at 11:30. As we passed, the keeper dipped his colors, which salute we returned, only to find that he had been saluting a battleship some two or three miles to starboard. Immediately afterward we heard the boom of her gun in answer.

Pollock Rip Shoals was the last lightship we had to pass, and for the rest of the way there was nothing to do but to skirt along the Cape until we got to Provincetown. So, keeping about three miles off shore, we crawled along, until finally off to Chatham we ran into a flat calm. We drifted along, sails flapping, for two hours, until finally a light breeze sprang up from the northwest and we straightened out again on our run along shore. Nauset, with its three towers, was passed, and next South Wellfleet, with the four tall towers of the Marconi system standing out against the sky. We were only a mile or so off shore now, and the wind was freshening steadily. The white sand banks kept getting higher and higher, varied at rare intervals by scattered houses. If there is a more desolate place along the coast than the barren, monotonous sand banks along the shore of Cape Cod, the crew of the Nerine does not want to see it.

By this time we were off Highland Light, and the wind was coming in chunks right off shore. The lee rail was way under, and, with Rudolf at the tiller and the rest of us lined up along the weather rail, we tore along in a smother of foam. A large fishing schooner slowly overhauled us, and finally passed, close to windward, her crew watching us closely. We noticed that they had all the sail they wanted, even without topsails.

The puffs were getting heavier and heavier, until finally we decided to lower the main and tie in two reefs. This was done in short order, and the sail hoisted again. Even under this shortened sail we staggered along, heeling dangerously at times, until, noticing the mast bending

with each puff, we lowered the jib, and Rudolf went out on the bowsprit to reef. The spray was flying off the water in clouds, and chancing to look towards the bow a moment later I saw a low line of clouds coming, preceded by a solid bank of foam and spray ten feet high.

"Cast off that main! Stand by the halliards, quick!" and Pot got to the sheet just as the squall struck us. The boat heeled over until the water was up and around the mast, and just as we were sure the stick was going, she slowly righted. By this time we had the sails down. We drifted stern first for a moment, then turned and started out to sea. The wind was blowing with fearful force, at least sixty miles an hour, and a terrific sea was kicked up in no time. While drifting backwards the tender was caught under the stern, and now was full of water, sometimes going under altogether.

"We must make sail, sir, and try for harbor," said Rudolf. It certainly looked bad. Provincetown, our only port, was twenty miles away, at least fifteen of them dead to windward. Seas eight feet high were running, and

On Board the Yawl Nerine—Looking aft.

getting higher and higher every minute. But there was only one thing to do, so we hoisted the main with two reefs and jib with one. While under the stern the tender had parted the bumpkin stay, so the mizzen was useless.

Slowly trimming the sheet, we worked around and commenced our long beat. We drove and plunged fearfully, and added to this the tender retarded us so that we made almost no headway at all. The wind had, however, fortunately let up a little, so that we were not obliged to luff up into every puff. A little later we shook out the reefs in the main, and seeing that we never could expect to make Provincetown with the tender keeping us back, all four of us took hold of the painter, and, expecting it to part every second, by main force we pulled the boat up on deck. We lashed it, bottom up, in the first place that presented itself—which place, unfortunately, hid the compass from sight—and at once began to make better time. The sun went down while we were busy with the tender, and, in the dark, we began once more to head up into the seas. Every few minutes a tremendous one would wash over the decks; the boat would shake herself, hesitate a moment, and then plunge forward, only to receive another comber. The scuttle forward was a bit loose, so things below were flooded in no time.

We kept on beating along, diving heavily into every sea, until about ten, seeing by Race Point and Wood End Lights that the point of the Cape had been passed, we headed down towards the harbor. As soon as we stopped heading up into the seas, we rode easier, and for the first time since two o'clock things began to look bright again. Shave went below to look at the chart, and when he came up said, "We finished that beating just in time, fellows. There's three inches of water on the floor."

As soon as we had run down far enough we put the tender overboard again, came about—not daring to gybe—and headed for the buoy off Long Point. We tore along, and by some sort of luck just grazed the buoy in

the darkness. Then, trimming sheets and once more in smooth water, we reached up into Provincetown harbor. I've seen welcome sights, but nothing can ever equal the joy I felt at seeing the riding lights twinkle just ahead of us. We dropped the hook, lowered and carelessly furled the sails, and then went below. It was just 11:30. With a short prayer of thankfulness, we tumbled into our wet bunks and slept.

Not one of us came to until eleven next morning, which was Thursday, the 16th. We turned out, pumped her dry, and, while breakfast was cooking, brought everything on deck for a good drying out—blankets, mattresses, and even the stuff in our suit-cases. We noticed another small craft astern of us engaged in the same drying-out process as ourselves. Chancing to meet two of her men ashore later in the day, we found that they had had even a worse time than we, not making harbor until three, and having grave fears of not getting in at all. We also learned from the crews of some of the fishermen that even the largest of them had been forced to run before the storm for a time under bare poles. So we decided that we had come through mighty well, our only damage being some paint scraped off and the broken bumpkin stay.

After breakfast we looked around for another anchorage, as we were too far out, and decided that the best place was right off the sternboat wharf, within easy rowing distance of the N. Y. Y. C. float. Hoisting everything, we wound in and out among the fleet of Gloucestermen and anchored some hundred yards off the end of the wharf. As soon as the sails had dried they were lowered, furled, and the covers put on. Then, while Shave and Rudolf stayed aboard to clean things up, Pot and I rowed ashore to lay in a stock of provisions.

We laid at anchor until Monday, the 20th, painting, varnishing, and repairing. One whole day we spent in fixing the water tank; one of the pipes had sprung a leak in the storm, and the tank was full of bilge water.

Our stay at Provincetown was without incident, except for a hard southeast blow which came up unexpectedly about midnight Saturday. The harbor is open to the southeast, so a good sea was soon running. All hands turned out and stood ready with sail covers off in case the chain should snap, but everything held, and we rode the gale out in safety. One schooner dragged three anchors until she hit the wharf; all her seams were started, and most of her spars and rigging smashed from pounding against the piles.

On the morning of the twentieth we said good-by to Provincetown, and, once outside the harbor, took our course W. by N. for Gurnet Whistling Buoy, off Plymouth. The wind was light and the Nerine rolled badly in the heavy swell left by Sunday's storm. After a slow run over we sighted the whistler, and, with frequent references to the chart, ran in against a strong head tide past the buoys and Bug Light, coming to anchor in the Cowyard at five o'clock. As soon as the sails were down, Pot, Shave, and I embarked in the tender to go ashore for dinner. After a slow sail over we landed at the Myles Standish Hotel, and, after dinner there, drove over to Duxbury and engaged Clarence Smith, one of the fishermen, to pilot us in near the hotel. No stranger should attempt to anchor in Plymouth, Duxbury, or Kingston Bay unless with a pilot, as the whole place is full of sandbars and mud flats. From this, however, the Cowyard is excepted.

Clarence came out early the next morning and left us anchored safely in the gully, about a quarter of a mile off the hotel. We lay quietly here for nearly three weeks. On Saturday, August 8, Clarence came aboard, and we took a party of friends for a short sail out beyond the Gurnet. After sending them ashore in a catboat, we anchored for the night in the Cowyard. Pot had gone back to Jamestown, but Mark Hutchinson was with us for the trip to Marblehead. We weighed anchor at eight o'clock Sunday morning, and beat out to the whistler in a drizzling rain and light easterly wind. Once clear of the land the breeze freshened and we took our course N.  $\frac{1}{2}$  W. for Boston Lightship. The fog shut in, and the first sign of anything that we had was a glimpse of the tall gray tower of Minot's Ledge Light, off Cohasset. Then the fog shut down again, and after a sharp flurry of rain we made out Boston Lightship looming through the mist, rolling heavily in the long ground swell. We reached along past her, waved to the solitary watchman on deck, and then lost her in the fog again. Steering N.  $\frac{1}{4}$  W., after another weary stretch, varied by heavy rain squalls, we made out Marblehead Rock, dead ahead. Rounding it, we came into sight of the forest of masts in the harbor, and running down past the Corinthian and Eastern Y. C.'s, anchored off the Boston Y. C. station.

Marblehead is by all odds the best harbor that we struck all summer. It is perfectly sheltered, with plenty of water, and the continual presence of a large fleet of yachts keeps it alive all the time. In anchoring, however, one should be careful not to run up too far.

We laid here until Wednesday, the 12th, waiting for a fair wind to make the trip around the Cape. A steady northwester began to blow early Wednesday morning, so we made ready. Provision lockers and water tanks were filled, and, remembering our experience with the tender on the other trip around, we hoisted it on deck and lashed it alongside the forward skylight. After carefully

looking everything over, we weighed anchor at two o'clock, and reached out past the Rock, taking our course S. E.  $\frac{3}{8}$  S. for a point three miles off Highland Light, Cape Cod. Our idea was to sail all night and get to the shoals, the hard part of the sailing, by daylight, thus having plenty of time to run up to Vineyard Sound and make Edgartown before dark. All our night-sailing would be in the open sea, and with good weather, and the numerous lights along the Cape, all would be clear sailing. Again, if a storm should blow up before night, we had Provincetown to run into.

From our experience in making the two trips around the Cape, I thoroughly believe this course the wisest for small boats to pursue. Take the rough work over the shoals by daylight, and leave the rest—the easy part—for night work. Of course, one always has to take his chances on storms; in this connection I may remark that one good life-belt to every man is a mighty good thing to have along.

All hands were in fine spirits, and we ran along with the wind off the quarter, making fine time. We noticed a fishing schooner some three or four miles to starboard, and wondered as to whether or not we could pass her bows. Then we passed a party fishing from a small sloop which was rolling heavily in the swell; so much so that one woman contributed to Neptune three times while we were in sight of them.

The schooner was quite near us now, but expecting each moment that they would head up a bit and pass astern of us, we kept on. She drew nearer and nearer, until she was almost on top of us. "Head her up, you damned loafers!" yelled Rudolf. By this time her towering sides had blanketed us, and her high bowsprit kept coming on and on, until the jib boom caught on our port mizzen shrouds. As we went down in the trough of the sea she rolled clear of us, and for a moment we thought we were free, but with the fisherman's usual disregard of everything pertaining to right of way, her captain doggedly held to his course, and caught us again, this time by the mizzen mast. The huge hulk kept forging ahead, and pulled our stern around with it until the mizzen snapped under the strain and fell, a mass of wreckage, into the water. Then we began to drift towards her stern, scraping along her sides, and parting something with every swell. The fluke of her anchor caught on our starboard runner and snapped it like a thread. Seeing that our mainmast would go in a second, Rudolf threw a line aboard the schooner, and one of her crew, who until this had been standing idly on deck looking at us, made it fast, while others trimmed her main sheet to get the boom out of our way. Then they let go the line, and in a shower of curses from both boats we dropped astern, reading the name "Juniata, Boston," on her stern as she passed us.

"Put right for Lawley's," I said, and we trimmed sheets and headed over towards Boston, all our plans for the trip around the Cape knocked into a cocked hat.

The details of the collision are as follows: We were on a broad starboard reach, and Juniata was on a still broader port reach; having, therefore, right of way from each of two rules of the road, we kept on our course until it was too late to do anything, expecting each moment that the schooner would give way. With the fisherman's usual "to h— with the rest" attitude, her captain kept on and deliberately ran us down. We have since entered suit against the owners of the schooner.\* My advice to men in small boats is "Keep away from the big fellow, and give way every time."

We kept on beating over towards Boston, clearing the wreckage as we went, and finally made out the whistling buoy off the entrance to the harbor—we were almost out of sight of land when the accident occurred.

We beat in past it and the Graves, and getting the chart on deck and following the south channel, crawled along against a head tide past Deer Island Light and up through President Roads, finally bringing up hard aground on a mud flat off City Point, just at dusk. We knew the tide would soon be flooding, so kept sails up, and floated off in the course of an hour or so. Dropping the hook over near the wharf, we had supper and turned in, thoroughly disgusted with humanity in general.

The best anchorage for small boats in Boston Harbor is where we were, at City Point, which can be easily located on the chart. The anchorage is good on either side of the wharf. Close attention, however, must be paid to the chart to avoid running on the numerous flats thereabouts.

The next morning Shave and I went ashore and over to Lawley's. After some bickering, he sent a launch around for us, and hardly knowing her for the same boat without her mizzen, Nerine was towed around to Lawley's basin and hauled out. This was on the morning of Thursday, August 13; we had expected to be in New York by the 17th at the latest.

Lawley did a quick job, and Saturday, the 15th, found the boat afloat again. We had persuaded Ed Habich, a Boston fellow, to make the trip down with us, so he came over to Lawley's Saturday, and we slept aboard for the first time since Wednesday. At seven o'clock Sunday morning we turned out and had a consultation, deciding to run around the Cape in anything short of a hurricane. With four aboard we could stand watches easily, so we worked the boat out from Lawley's basin and made sail. Then, bringing the chart up on deck again, we started to beat out of the harbor, taking our course down through the Narrows and Nantasket Roads. A dead calm came up at nine, which, varied by short puffs of air, lasted all day, so that at nightfall we were only just up to Boston Light. At dusk a breath of air came up, and as we were crawling along we passed a huge five-master anchored off the harbor waiting for a breeze. Knowing schooners, we gave her a berth of about a mile, and steered a course S.  $\frac{1}{2}$  S. for a point three miles off Highland Light. Rudolf and Ed drew first watch, from six to twelve, so after lighting the binnacle and sailing lights, Shave and I turned in, leaving Rudolf and Ed just abreast of Minot's, whose bright light was flashing its "143" out through the darkness.

We slept soundly until twelve, when Rudolf turned us out. On deck everything was pitch black—not a sign of anything except water and innumerable stars. Minot's

\*Mr. Etherington has since notified us that after suing the owners of the Juniata for the damage done in the collision, he has since received \$125. This amount covers the entire damage done in the collision.

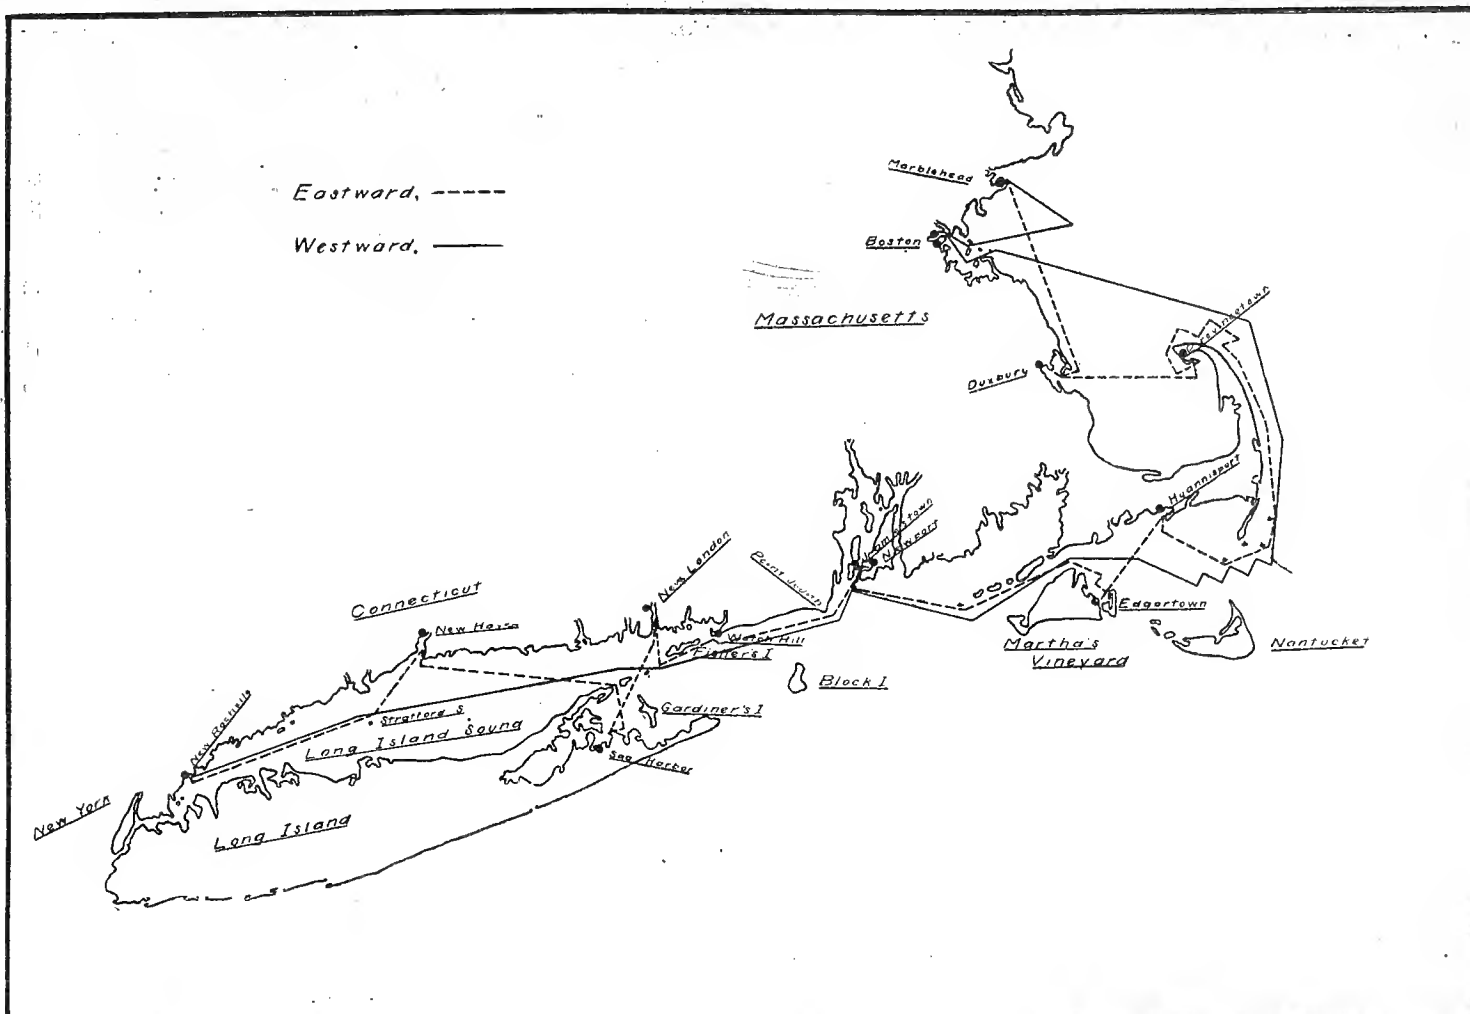

Chart of Course taken by the Yawl Nerine.

had been dropped and Highland Light, owing to light breezes, had not yet been sighted. To all intents and purposes we were alone on the deep. It was our first experience at being out of sight of everything, and a feeling of almost awe crept over us at the thought of the vastness of the great ocean.

The other watch went below and left Shave and me on deck. Shave took the first hour at the tiller, and just as I was going on for my trick I made out a faint flash ahead. Timing it, we found that it was our old friend Highland Light flashing at five second intervals. A bit of a breeze sprang up out of the northwest, and soon we could make out the white flashes of the light on Race Point. The moon came up about one, and we passed several red lights off to port, one coming so near that we showed our lantern.

At four o'clock it commenced to get lighter, and it kept getting more so, until about five the sun rose. We put out the binnacle and lights, and were taking them below, when the breeze dropped suddenly. We drifted about aimlessly until six, when we turned Rudolf out and had breakfast. As we were eating, a light breeze came up dead ahead, so we started to beat down the coast again. Highland Point was passed about ten, and in two long tacks we drew out a good two miles ahead of a black sloop that had been beating ahead of us. Let me pause here to remark that whatever may be the disadvantage of a deep draft, it counts in beating. All summer long we didn't find a single boat our size that could even touch us in clawing out to windward, and we gave many a bigger craft a good argument. I'm for a deep boat every time.

Nauset and Chatham were passed slowly, and, taking short tacks, we sighted Pollock Rip Shoals Lightship, passed it, and got to Pollock Rip just at sundown. So far we had been under way thirty-five hours, and had made about eighty-two miles, most of it in dead calms. Thanks to the winds the worst part of the trip, the part over the shoals, had to be made in darkness, just what we had been trying all along to avoid.

After an early supper, Rudolf and Ed turned in. Shave and I on watch had to make Handkerchief, which bears W. by S. from Pollock Rip, a course which, however, was almost dead to windward. The wind, blowing due east, was heavy and full of puffs, and blowing against the tide, kicked up a nasty cross chop. We would be steering along in the dark through fairly calm water and suddenly would find ourselves in breakers five and six feet high, through which the Nerine would splash and flounder, pitching fearfully. Then it would seem to lighten a bit, and we could see a line of foam and more tossing breakers ahead; coming up to it, it would be only another tide rip. We slowly lost Pollock Rip, and, taking long tacks, passed the two fixed white lights on Handkerchief. Shovelful and Monomoy Point could be seen off to starboard. A heavy thunder squall came up, and we went through it in the midst of a fearful tide rip. Waves were breaking all around us, and every minute or two a huge comber would come splashing aboard, gurgling out through the scuppers the next moment as the boat rose on some cross sea. Thunder was booming and lightning flashing on all sides. The terrific pitching and diving loosened the new mizzen in its step, and it began to creak and sway so alarmingly that Shave rigged a tackle from up near the jaws of the gaff to the foot of the mainmast, having to shift it every time we came about. We were now making for Cross Rip, bearing W.  $\frac{1}{4}$  S. from Handkerchief, and the wind shifting a little, we were able to lay our course. We could see two lights over near Nantucket, which we made out to be Great Point and Great Round Shoal Lightship, also Handkerchief, Shovelful, and Monomoy Point, so we knew pretty well where we were. We kept on for about two hours, and thought we were due to see Cross Rip.

"There's a light off the port bow," said Shave. "But that's white. Cross Rip ought to be red. Going below for a look at the chart, and getting our bearings, we decided that the chart was wrong, and that the light must be Cross Rip; so, changing our course, we made for it. The light grew larger and larger, and I, on watch in the bow, was congratulating myself over having done so well, when suddenly I saw the shadow of a sail loom up ahead. "Hard a-lee, quick!" and Shave, astonished, swung her around as I let go the mizzen tackle. "Here she comes. Keep as you are." "As we are," repeated

Shave, and, wondering why we didn't see any sailing lights, we kept on our course for a minute, and soon came upon our sail and light at the same time. It proved to be the riding light and sails of a large four-master lying at anchor waiting for a fair wind. We put the Nerine on her course again, and eight bells sounding, I went below to turn out the other watch. We were still pitching every now and then, and the fellows below said they hadn't been able to sleep at all. As soon as they came on deck, Shave and I turned in in a hurry, and at once dropped off into a sound sleep.

"Wake up, Sandy, it's six o'clock," and I sat up, bumping my head against the deck-beams. It was Ed. "Where are we?" "Off Vineyard Haven." I hopped up on deck, and what a change from when we had turned in. We were in Vineyard Sound, in smooth water, and tearing along past West Chop in a spanking southeast breeze.

"Did you see Cross Rip?" "Not a sign of it, sir. Saw Bishop and Clerk's and Succoneset Lightship, but not Cross Rip." To this day we haven't been able to account for our not seeing the lightship. We kept a good watch and steered a true course, and according to all reckoning from Succoneset and the red sector of Bishop and Clerk's must have passed within at least half a mile of it. Whether a fog came up around the ship or whether the lights were temporarily disabled, or something else happened, we will never know.

We reached along through the Sound until off Tarpaulin Cove another of our calms came up, and we drifted around from seven o'clock until two in the afternoon, a fair tide, however, taking us down almost as far as Cuttyhunk. Just as the tide turned a breeze sprang up, and we passed Vineyard Sound Lightship and took our course W. by N.  $\frac{3}{4}$  N. for Brenton Reef. We ran over with a smashing breeze on the quarter, and crawling up the harbor against a strong tide, we dropped the hook off the Conanicut Y. C. at seven. We had been under way just fifty-nine hours and had gone about one hundred and seventy miles, an average of not quite three miles per hour. But of the fifty-nine, at least twenty-five had been spent in drifting about waiting for a breeze.

We laid at anchor from Tuesday night until Thursday morning. After vainly trying to persuade Pot to sail down with us, we said good-by to Jamestown Wednesday evening, and turned in early. At eight o'clock the next morning we hoisted sails and started to beat out of the harbor. As soon as we got outside a heavy rain set in with a thick fog, so all went below, except Shave, who steered S. W. for the whistler off Point Judith. A stiff southeaster was blowing, with banks of rain clouds hanging low, but we kept on, and just as the buoy was sighted through the mist the fog lifted, the sun came out, and we had clear weather all the way down. We skirted along shore some five miles out, and in a fine breeze reached along past Watch Hill and Fisher's Island. Off Fisher's Island there was a tremendous long swell; a lumber schooner passed, and when both boats were down in the trough of the sea we were unable to see even the tops of her masts.

About five o'clock we rounded Race Rock, and at once ran into a heavy tide rip, almost as bad as the rips on the shoals. Once through this we headed up and steered due west for Middle Ground, off New Haven. Night was just coming on, and the lights on Plum Island and Orient Point began to twinkle over to port. The other two had first watch, so Shave and I turned in. Along about nine we were awakened with a start by a tremendous diving and splashing, and rushing on deck saw the stern lights of one of the Sound steamers disappearing ahead of us. From nine until our watch at twelve there was a continuous procession of all kinds of steamers and tows, and we couldn't sleep for more than ten minutes at a time. The boat was bucking a head tide; and evidently not making much, as I heard Ed ask Rudolf five different times, "What's that white flash over there?" Rudolf's answer was the same every time: "Faulkner's Island."

At twelve, Shave and I went on deck. Red, green, and white lights were all around us, but looking around a bit, we saw Faulkner's Island flash, and taking its bearings soon made out where we were. The other watch went below, and, the tide turning, we steered along past the two lights on New Haven breakwater, finally making out Stratford Shoal ahead. We passed this just as the sun came up over our stern, and in a diminishing breeze

steered straight up the middle of the Sound for New Rochelle. At six o'clock Ed and Rudolf came up, and all hands had breakfast. We passed Huntington and Oyster Bay, then Greenwich, Rye, and Larchmont. In a breath from the southwest we crawled along past the channel buoys and up into Echo Bay, dropping the hook for the last time at just 2:30, and firing the cannon as the chain ran out.

This was on Friday, August 21. It had taken us five days and three nights to make the trip from Boston—some two hundred and eighty miles—not counting the time spent at Jamestown. Altogether, we had been gone fifty days, and had sailed in the neighborhood of seven hundred and fifty miles.

After putting things in order, Shave, Ed, and I went ashore to the club for dinner, then went aboard again and packed up, ready to leave in the morning. Our trip was over.

At eight, after a swim and breakfast, we got into the tender, said good-by to the staunch little Nerine, and Rudolf rowed us ashore. After shaking hands all around, Rudolf rowed back alone. We stood watching him until he got aboard, dropped the tender astern, and hoisted the blue flag at the starboard spreader, and then with one last look at the little craft that had carried us safely through all kinds of good and bad weather, we turned and slowly walked over to the car.

## Boston Letter.

BOSTON, Feb. 27.—Everything is still frozen up tighter than a drum, and there is very little doing in the yards. At Lawley's, where most of the work is being done, the shops are not nearly so crowded as they have been in previous years. Two steam yachts are in the west shop, one of 115ft. waterline, designed by Mr. Fred D. Lawley, for Mr. Paul Rainey, of the New York Y. C.; and the other of 99ft. waterline, designed by Messrs. Swazey, Raymond and Page, for a Philadelphia yachtsman. The first of these is nearly all plated, and the deck joiner work is being put in. The second is all plated, the deck laid and the joiner work being put in. In the east shop there is a 62ft. steam yacht by Mr. F. D. Lawley for Commodore B. P. Cheney; a 102ft. steam yacht designed by Mr. Arthur Binney, for Mr. Chauncey M. Borland; two power launches and a 22-footer, designed by Mr. Lawley, for Mr. S. C. Winsor. There is also a 50ft. schooner for Mr. J. Cromwell, of New York, which has been finished. In the boat shop, the 18-footer designed by Mr. E. A. Boardman, for Hon. Charles Francis Adams 2d., to race in the one-design class against the one-design class of the Beverly Y. C., has been finished and has been hauled out of the shop. The 18-footer by the same designer, and for the same class, for Vice-Commodore C. H. W. Foster, of the Eastern Y. C., is planked and the deck is being laid.

On Feb. 19, the boat shop of Mr. David Fenton, at Manchester, was destroyed by fire. There were three 18-footers in the shop at the time. They were owned by Reginald Boardman, Messrs. R. deB. and E. A. Boardman and Mr. B. D. Barker, respectively. The first two had been completed, and were intended for the one-design class which is to race the Beverly Y. C. one-design class during the coming season. The third boat was very nearly completed. All three of these boats were destroyed completely, as was a lot of valuable hollow spars, sails and rigging that were stored in the loft. A few of the yachts stored in the yard were scorched, but not enough to require any great amount of work to repair them. It is undecided as yet, just what Mr. Fenton will do about the boats that were destroyed, but it is thought that he will rebuild them. The Boardman boys have entered into this one-design class with spirit and are almost certain to build new boats at some place.

It is now practically certain that the announcement made in this column recently, to the effect that Mr. Frank Gair Macomber, Jr., and Mr. S. Reed Anthony had ordered yachts for the new 30ft. class, was correct. This was confirmed last week by a Boston designer who is in a position to know. Mr. T. K. Lothrop, Jr., said to the writer within a few days that the class was sure of three boats, and it is possible that there may be five before the season opens. For a new class, considering the falling off in yachting during the past fall and winter, three boats would be a very good start, and five would be considered extremely fortunate. The 30-footer, ordered by Mr. T. K. Lothrop, Jr., from Messrs. Burgess and Packard, has been started, and is now partly in frame. The designers have taken the contract for the construction of this boat, and she is being built at Beverly. It is expected that this class will be proposed for adoption at the spring meeting of the Yacht Racing Association of Massachusetts, but when this matter comes up, it is more than likely that there will be some conflict between the class and the 30-rating class formed by Mr. Louis M. Clark, and adopted by the Association at its fall meeting. However, if the Association does not adopt the class, it is quite possible that the clubs will make provisions for the boats in the races scheduled during the coming season. If the Association does not adopt the class at its spring meeting the boats will not have an opportunity for gaining a Y. R. A. championship, and, for all that might be said, this has been the object of racing men in Massachusetts Bay for many seasons.

Mr. C. S. Eaton, who owns Cock Robin, probably the most famous raceabout in the country, which was designed and built by the Herreshoffs, had an order with the Bristol firm for a 30ft. knockabout. It is understood that this order has been canceled, and that in place of the 30-footer, Mr. Eaton is to have a 40-footer. Capt. Nat Herreshoff was in Boston some weeks ago, and it is supposed that it was the change in the length of Mr. Eaton's boat that brought him here.

Messrs. Burgess and Packard have purchased the yacht brokerage business of Mr. Hollis Burgess. They are also changing the location of their offices, and on and after March 1, will be at 330 Board of Trade Build-

ing. Mr. Hollis Burgess will retire from the yacht brokerage business, and will enter the lumber business. He has a host of good wishers in his new venture. He will not be out of sight of the yachtsmen, however, for he will race at every opportunity available during the season. Mr. W. Starling Burgess returned from Europe last Tuesday. He opened offices in London for a short time, but closed them just before returning to America. He reports that there is nothing doing in the sailing yacht building in England, and that there is very little on the Clyde. He was in Germany, also, where, he states, there is little or no building going on. The principal interest in Germany centers around the Emperor's cup races at Kiel. Messrs. Burgess and Packard have orders for a 32ft. launch and a Y. R. A. 15-footer, both for Boston parties, who wish their names withheld for the present.

Mr. Norman L. Skene, who has been associated with Mr. Hollis Burgess, has an order for a 16ft. cat, to be built under the rules of the Chatham Y. C., for Mr. Franklin J. Hamblin. He has also an order for a 23ft. launch for a member of the Boston Y. C., to be used at Hull. The launch will be elaborately built. Her deck trimmings and combings will be of mahogany, and all the metal fittings, including the casing of the engine, will be nickel plated. She will have a 3 horse-power Murray & Tregurtha engine. Both of these boats will be built by Mr. T. L. White, of Manchester.

Mr. B. B. Crowninshield has an order for a 16-footer, for Mr. Faschen, of Toronto, Canada. He has also an order for a big fisherman, for Boston parties. This vessel will be about 100 tons net, and about 150 gross. He has sold, through his New York office, the Herreshoff Bar Harbor 30-footer, Redwing, owned by T. G. Condon, and the Y. R. A. of M. 21-footer, Opitsah III, owned by Mr. H. M. Whitney. Both of these boats were sold to New York parties, who wish their names withheld for the present.

Messrs. Small Bros. have an order for a 34ft. launch for Mr. H. W. Hornthar, of Norfolk, Va. They also have an order for a 28ft. waterline cruising yawl for Mr. B. P. Simons, of Boston.

JOHN B. KILLEEN.

## British Letter.

THERE is a good deal of speculation rife as to what will be the answer of the New York Y. C. to Sir Thomas Lipton's letter, and whether there will be another series of races for the America's Cup in the near future. From rumors, which have reached this side, there appears to be a considerable section of members of the club in favor of sticking to the old rule, but it is hoped that they are in the minority. If not, and they have their way, it is certain that no race will come off, for the boats necessary to compete must be of such extreme type, as not only to be absolutely useless from any other purpose than the mere cup races, but also positively dangerous on account of their extreme lightness of construction, combined with enormous flat overhangs, in view of the long ocean voyage. Sir Thomas Lipton has had three tries for the Cup, and is willing to have another, if he thinks he can get anything like a fair chance of success. Under the old rule that would be quite impossible, as nothing but a regular freak in the way of a skimming dish could have any chance with Reliance, or another boat of her type; and it is pretty well certain that none of our foremost designers would get out the lines of such a vessel. More than this, yachting, as a sport, is not advanced one whit by such useless monstrosities, and the British owners do not feel inclined to waste their money over them. It is, of course, too early to conjecture as to what the result of the new rating rule will be, but it is unquestionable that a far more wholesome type of boat will be encouraged by it, and as there can be no America's Cup contest before next year, ample time will be given to American designers to become intimate with the working of their new rule, and they will still have the whip hand of us in that respect. The prevailing opinion in Great Britain, especially on the Clyde, is that the matter should receive careful consideration, and that, whatever decision the committee of the New York Y. C. arrives at, it will not do so in a hurry.

The projected visit of the schooner Ingomar to British waters has caused the greatest satisfaction, and if the vessel turns up, no doubt many races will be open to her. It is unfortunate that schooner racing has suffered so much during the last fifteen years, the true reason being that schooners, as a class, have never been recognized and kept to themselves as they should have been, but have always been compelled to compete with cutters and yawls. Many people have the mistaken impression that schooners can reach faster than cutters or yawls, and this idea is shared by some yachtsmen of experience. It has been pointed out again and again, and notably by the late Mr. Dixon Kemp, who was an acknowledged authority on such matters, that schooners are at a great disadvantage with single stickers on all points of sailing. It is obvious to anyone that in beating to windward and running, this is the case, and the same remark applies, though with not so much force, to reaching. A vessel is harder pressed when broad reaching than at any other time, and it is just then that the weight of the extra mast and topmast would tell most severely. Moreover, the mainsail of a cutter is a better sail for driving a vessel than the two sails of a schooner; and the only reason why schooners are saddled with fictitious reaching powers, is that in mixed races the two-stickers are usually double the size of the cutters or yawls. The inferiority of schooners over all round courses has resulted in their total disappearance from British waters as *bona fide* racers, and the very few yachts of that type which have been built within recent years have all been turned out more with an eye to comfort than speed. If Ingomar has anything like the pace she is credited with, she will not find anything over here worthy of her mettle among vessels of her own rig, and she will get better sport in German waters, where schooner racing has been made quite a feature by the

German Emperor. At any rate there will be nothing big for her in British waters, until Cowes Week, though she would have a good many races with the mixed handicap class, if her owner elects to go the rounds with her.

So far as substantial results are concerned the meeting of the Yacht Racing Association, on Feb. 2, resulted in smoke. Mr. Manning, one of the vice-presidents, brought forward a motion that all yachts sailing under Y. R. A. rules, should be built to Lloyds new rules of scantlings, but nobody had sufficient courage to second it. The question of modifying the rating rule was also discussed, but that shared no better fate, and the present rating rule holds, therefore, until the end of the season 1907. Until then it is hopeless to expect a healthy revival in the 65ft. or big classes, and the handicap classes will therefore, as of late years, provide the bulk of the sport.

It is refreshing to find that the 52ft. class is full of life, and the advent of the new boat building at Fairlie will be eagerly looked forward to. It is more than doubtful whether Lucida was an improvement on the famous Magdalen of three years ago, but Fife will probably turn out something this time which will be more slippery than either of his former creations. If so, Moyana will be the toughest opponent for the new boat, as she was unquestionably the pick of the fleet last year, though she rarely had anything but bad luck. It would, indeed, be interesting if Mylne were to get an order for another 52-footer, but so far there is no news of such a desirable addition to the fleet. It may be taken for granted that Viola will not appear under racing colors, as she is a distinct failure. With Moyana, Lucida, Camellia, and the new Fairlie boat, however, there should be a great deal of sterling good racing in the class, and it may be taken for granted that the prizes will be pretty fairly distributed unless the new boat turns out a phenomenal flyer.

Of the smaller classes, the 24ft. raters seem to be the most flourishing. Three new boats are building for that class on the Solent, but the 36ft. class is extinct, and the 30-footers are threatened with the same fate. On the Clyde the 36-footers have been revived, but in most other districts one-design boats are ousting the small Y. R. A. classes altogether.

E. H. KELLY.

## Gas Engines and Launches.

BY F. K. GRAIN.

SOME five years ago the writer published a series of articles in FOREST AND STREAM on the subject of internal combustible engines and launches. At that time the knowledge of the public on gasoline engines was but limited, therefore the article was necessarily restricted; not only that, but the writer, along with many other experts and manufacturers, have gained by experience vastly more information in this short space of time than has been learned in but few other branches of mechanical lines. It may also be truthfully said that in design, construction, and general practice the internal combustion engine has made more and greater strides in the last five years than the steam engine in the previous twenty-five years. As before, the writer will endeavor to drop all technicalities, putting the subject before the reader in terms which are bound to be understood by those with a minimum amount of knowledge on the subject.

### The Two Cycle Engine.

The bulk of the launch owners—and their name is legion—are mostly employing engines of 6 horse-power and under. These engines are nearly all of the two-cycle type; therefore we will take up this type of engines first. The operation of the two-cycle engine is by far the simplest of any of the gas motors; although, on the other hand, it has double the number of operations to perform that the four-cycle type has, it having an impulse of the piston at each revolution.

We will now suppose that the engine is resting on the lower center with the piston down; it then ascends, this creates a vacuum in the air-tight crank case. When the piston reaches its upper center, the previous charge, which is already in the cylinder, is ignited, driving the piston down. Before reaching its lower center, the exhaust port is opened, allowing the burnt gases to escape. Soon after the opening of the exhaust port, the inlet port opens, allowing the first-named mixture of gas, which by descent of the piston has been compressed in the crank case, to flow upwards into the cylinder, where the piston on ascending compresses this gas, when it is ignited by the electric spark, and the operation is repeated. By this means we have a working cycle on the descent of the piston, and an idle cycle on its return; therefore the so-called two-cycle, which definition is apt to be misleading to the novice, and we certainly think that single-cycle would express the operation much more clearly to the average reader.

We will now begin from the bottom up, and describe as fully as possible the different parts, their requirements and functions. To begin with, we have the lower part of the engine through which the crank shaft passes. This is usually called the crank case or compression chamber. As this part of the engine must be necessarily gas-tight, the bearings through which the crank shaft passes have to be made solid and of extra length, in order to avoid any leakage. This, of course, precludes the use of the general methods employed for taking up wear in the bearings; for that reason, should the bearings wear very much, it is necessary to replace them with new bearings. All manufacturers endeavor to make the crank case as small as possible, allowing just room enough for the play of the crank, as of course the smaller it is the better the vacuum will be which the ascent of the piston produces, consequently producing a stronger draft on the vaporizer and drawing in more gas and enabling it to force a larger charge and force it more rapidly into the cylinder. The endeavor of most all builders is to get this crank case compression as high as fifteen pounds to the square inch. This, however, is not often accomplished without the conditions being perfect, and where the ports are properly designed a pressure of one-half the above produces excellent results.

FAST CRUISING LAUNCH, 39 FT. L.W.L.—DESIGNED BY LILJEGREN &amp; CLARK.

### The Cylinder.

We now come to the cylinder. On this subject there is very little to say, except that care should be taken to ascertain before buying an engine whether the builder is equipped to furnish a cylinder that has been reamed. The reason for this is that very few cylinders after being bored, are of the same diameter at both ends. This is owing to lost motion in the boring bar when extended through the cylinder. A properly equipped manufacturer, after boring the cylinder, will run a reamer through, taking out but a few thousands of an inch, but just enough to make the cylinder perfectly true from end to end. The writer has seen a number of cylinders that have been smoothed up by inserting emery and oil and allowing the piston to grind itself in with the engine belted up. This of course makes the cylinder appear perfectly smooth, but does by no means correct the aforesaid evil. While speaking of the cylinder, we would mention what is called the compression space, or the clearance between the top of the piston when at its upper center and the cylinder head. This space varies somewhat with different makes of engines, but a good, safe rule, and one almost universally adopted by the best designers, is to allow one-third of the area of the cylinder. Of course it is obvious that by reducing this space the compression will be higher, therefore, theoretically, more power. To offset, however, this extra compression, we should have to add weight to the flywheel, and of course the heavier the flywheel the more power it requires to preserve its momentum. Again, if we reduce the compression space beyond a certain point, we are reducing the volume of gas which we have to ignite, and although we may by high compression and small compression space obtain a very high initial pressure, there will be insufficient gas to obtain the necessary expansion throughout the stroke.

Another point which is an objection to high compression, is that it requires much greater cooling surface, consequently more water, and it is very liable to produce over-heating of the electrode point and other projections, and cause the engine to ignite spontaneously. While on this subject, we will mention a cause of trouble in some engines that we have seen, this being lack of material in the bar across the inlet and across the ports in the cylinder; this bar is put there to prevent the rings from slipping into the ports, and where these bars or bridges are not sufficiently rigid, the boring tool will jump on, striking them and leaving what we call a high spot in the cylinder. It might be thought that reaming the cylinder would obviate this, but in many cases these bars are so light that they will be sprung outward by the reamer, which consequently does not cut them at all.

[TO BE CONTINUED.]

The Erie Basin Y. C., of South Brooklyn, received its certificate of incorporation on February 25. The officers of the club are: Com., W. E. Wise; Vice-Com., C. W. Cooper; Rear-Com., E. Harrington; Sec'y, G. Buass; Treas., Thomas F. Patterson, M.D.; Meas., C. Maher; Trustees—Martin Flanigan, G. Gutkes, and H. Krause. The club will build a club house on property adjoining the yards of the John N. Robbins Company.

Mr. Charles L. F. Robinson, N. Y. Y. C., will sail on the schooner Ingomar on the other side, and will act as Mr. Plant's representative.

Ingomar will be able to compete in the race for Heligoland cup offered by the German Emperor. Hitherto only British and German yachts were eligible to race, but now it is open to yachts of all nations.

The annual meeting of the Huguenot Y. C. was held at the Arena, West Thirty-first street, New York city, on the evening of February 27, and the following officers were elected: Com., George C. Allen; Vice-Com., L. C. Ketchum; Rear-Com., George G. Bell; Sec'y, William B. Greeley, and Treas., John S. Taylor. W. L. Searles and Henry de F. Baldwin were elected trustees to serve for two years.

### Fast Cruising Launch.

THE accompanying design by Messrs. Liljegren & Clark, New York city, and now in course of construction at Goteberg, Sweden, suggests a successful combination of speed, comfortable accommodation, and seaworthiness within the given dimensions.

The design shows good freeboard, which is one of the essential features, giving headroom with a low cabin house, and adding to the general seaworthiness of the boat.

The adoption of the twin screws reduces the liability of several hours' drifting about, a possibility to be considered in cruising launches. The dimensions are as follows: L.O.A., 39ft. 6in.; L.W.L., 39ft.; beam, 6ft. 7in.; draft, 1ft. 8in.; freeboard forward, 3ft. 4in. The guaranteed speed is 18 miles per hour.

### Measurement of Racing Yachts.

Editor Forest and Stream:

I have read with great interest the various letters which have appeared in your journal in answer to my article on "Notes on the Measurement of Racing Yachts." The paper in question was not intended as a complete exposition on the subject of measurement rules; nor was it intended to advocate my particular rule or method of measurement. The purpose and limitations of the paper were clearly stated in the opening paragraphs as "to bring clearly before all yachtsmen the fact that the present rules of measurement are founded upon certain assumptions as regards the speed of yachts; to show that such assumptions are not clearly warranted by the data at their command." From reading the many letters, I believe that my paper accomplished the stated purpose.

The comments on my paper can be divided into two classes; comments on what my paper contained, and criticisms of omissions. The latter class I cannot attempt to answer, for I am well aware that many vital points were not touched upon in my notes—points that I should certainly have taken up had I been advocating any special rule or any method of measuring or rating yachts. Should one attempt to discuss all the points raised in the many letters, one would be obliged to write a treatise on yacht designing and yacht measurement.

My paper was devoted to an attempt to bring out clearly two points, and two points only:

First—That the present measurement rules involve certain assumptions, and that these assumptions are that the speed of a yacht is proportional to,

- a. The square root of length of hull,
- b. The fourth root of sail area,

and that the New York rule involves these two assumptions and the additional one that speed is proportional to

- c. The inverse sixth root of displacement.

Second—That these three assumptions are not clearly warranted by the data at the command of every yachtsman, and that if further investigation should prove the assumptions unwarranted, then all the present rules are wrong, and no amount of doctoring will correct them.

There has been no criticism of the first point; therefore I may assume that all the writers agree with me, and that I am correct in my statement that the present rules do involve the assumptions named.

There has been criticism of the second point that these assumptions are not clearly warranted by the data. Some writers discuss one assumption, some another, and perhaps the easier way to answer the writers will be to answer the criticisms of my points rather than the individual writers.

- a. Assumption as to length.

Very few of the writers have touched on this point. I said all I could in favor of the assumption, and, as I thought, stated guardedly and carefully that under certain conditions, and for certain speeds this assumption is not radically wrong. This point has been ably discussed by Sextant, who has explained very fully the qualifications which must of necessity be applied to this assumption.

Length certainly does not "produce" speed, as Sextant justly states, but length of hull does affect the speed the "power" is capable of producing, and, Sextant to the contrary notwithstanding, length may properly be brought into an expression which measures the speed of a yacht. So, too, may beam, draft, displacement, dimensions of sails, length and size of rigging, and hundreds of other dimensions and minute peculiarities of the yacht. In fact, the speed a yacht is capable of making under certain average conditions of wind and water may be expressed as

$$S = F (l, b, SA, D, \text{etc.}),$$

into which can be introduced as many elements as one wants. This merely expresses the fact that speed depends upon or is a function of, length, beam, sail area, displacement, etc. What power or root of length should be introduced into the formula is a matter for investigation and experiment. But it is not impossible to find a formula as a measure of speed which involves length and any other dimension of hull or rigging. It may not be wise to do, but mathematically it is perfectly proper to do so. I do not mean to say that the manner in which length is introduced into the present rules is correct, but I do say that in a properly constructed formula it would be correct to introduce length and as many other factors as found advisable.

Sextant's discussion of the point seems to leave us where I began, "the assumption is not clearly warranted." Possibly I erred in giving the benefit of the doubt to this time-honored assumption.

- b. Assumption as to sail area.

I do not think that the discussion has brought out any points to change my general conclusion that the assumption that the speed of a given hull varies as the fourth root of sail area is not clearly warranted by the data. The best discussion of the point seems to be that of Mr. Maybee, who shows that in order to increase the sail carrying power, the form of hull must be changed, and who states "that the change of form almost invariably detracts from the theoretical advantage due to her increased propelling power." This may be correct when such wide divergences of type and sail carrying power are contrasted as the old and new Cup defenders. But with all due respect to Mr. Maybee, his first illustration is a case of false reasoning, as he begs the question in his premises. If, in the old-fashioned lead mines which he uses to demonstrate his point, the VSA equals L.W.L., then to a certainty must VSA equal VL, and therefore the VSA will be as good a measure of the speed of the boats as is VL; for these measures, by Mr. Maybee's premises, are identical.

Mr. Phillips' statement in regard to Reliance would not need an answer, had not Mr. Lawton apparently given these statements the weight of his approval. In no part of my paper did I state or intimate that the speeds of different hulls are proportional to the square root or to any root of the sail area. I did attempt to show the effect of sail area upon the speed of the same hull. Mr. Phillips would have been correct had he stated that "according to the theory advanced by Dr. Poor, we might expect 'M' to show an average speed of 17.78 miles," provided she could carry the same amount of sail as the Reliance actually did. Similarly, and with equal justice, we might expect the Arrow to rival in speed the fastest express train, provided she carried the engines of the Lucania. But Arrow cannot carry the engines and "M" cannot carry the sail. Just as absurd conclusions can be deduced from the measurement rules in force; the old New York rule, which makes speed proportional to the fourth root of sail area, and under which the Cup races were held, states that Reliance without any sail should make 6.7 miles per hour! The practical formulae are few from which some absurd conclusion may not be drawn by applying them to exaggerated and impossible conditions.

Certain of the writers criticize my method of showing that the assumption in regard to sail area is not clearly warranted, and especially my example of the two boats, "E" and "M." These writers failed to recognize the

reasoning involved, and speak of the fact that the boats were not evenly matched. The fact of their being evenly or unevenly matched makes no difference whatever; the vital points are that "E" was sailed under the same conditions both years, and "M" with one condition—and only one condition—changed. In this comparison "E" was merely used as a trial horse. As a matter of fact, in 1902, instead of being "steadily and conclusively beaten by the boat 'E,'" "M" won on time allowance the series quoted, and in the seven races held under the Sound Rules, in which she competed against "E" in 1902, "M" won three and "E" won three, a third boat winning the odd race. In 1903, "M" was steadily and conclusively beaten by "E," and this result was due, and due only, to her reduced sail plan.

Again, Mr. Phillips and Sextant differ materially on the general question of sail area. According to the former, "there is no relation between sail area and speed, except in connection with length, and the latter is always the governing factor;" but if I read Sextant aright, sail area is the only speed producing factor, and the only factor which should be used in a rating rule.

Taking all these various and diverse views into consideration, does the conclusion that the assumption in the rules as to sail area is not clearly warranted seem so very far wrong? It may be that neither square root nor fourth root of sail area should be used; some other root or power or factor may better express the equities in the case.

c. Assumption as to displacement.

There has been no discussion on this point; the validity of the assumption has not been directly maintained, nor has it been disputed. Sextant, it is true, claims that for measuring purposes the rule would be improved by leaving out D altogether, and, on the other hand, Mr. Lawton maintains that the introduction of D into the rule marks a great advance. Neither writer assails my general proposition that the assumption is not clearly warranted. The diverse views held by them is alone sufficient evidence that the present use of D is not fully justified, and that "tests and experiments alone can show how the factor should be introduced into the rule."

#### General Statements.

The letter of Sextant is undoubtedly the most valuable contribution of the present series. The point he so prominently brings out in regard to all present rules, "that they undertake to combine in one formula two inde-

pendent and incompatible functions—the rating of yachts for time allowance and the control of form"—exhibits at once the weakness of all the later attempts to manufacture a measurement rule. He shows clearly the wrong methods which have been followed. On this point his paper is very strong and most valuable.

On other points, however, I am not in accord with Sextant, as I have before stated. I believe that it is not only practicable, but perfectly right, to find a formula for measuring the speed of yachts, which formula will involve length, sail area, and possibly other factors. In making such a formula, however, no consideration should govern the manner in which a factor is introduced, save only its relation to speed, but for practicability no factor should be introduced which is involved in a complicated manner or which is impossible of actual measurement. The introduction of D into the measurement rule as a means to control the form or construction is wrong. The introduction of D into the formula, as the result of investigation as to its effect upon speed, would be right and proper.

Form can be controlled by general restrictions, if necessary, and so can strength of construction. Such methods of control would, I believe, be far better than to attempt to control them by the haphazard introduction of factors into the measurement rule. Another point in this regard, which has not been brought out, is that "form" and "strength" are largely governed by the conditions of the race, not by the measurement rule. If the races for which a yacht is built are all held in smooth water and light winds, an exaggerated form and light construction will be used; if the races are long and in heavy winds and high seas, probably a moderate form and substantial construction will be used. So long as the races are held on a mill pond, enlivened only by an occasional squall, so long will owner and designer build a boat adapted to sail on such waters.

CHARLES LANE POOR.

#### The Scale of Time Allowances.

Editor Forest and Stream:

No one is likely to quarrel with the contention of Mr. Lawton that the current scheme of time allowances is illogical. Mr. Phillips has very cleverly illustrated its absurdities; and it might also be said, has somewhat magnified them, if one were disposed to defend the scheme, which the writer has no purpose to do. But

the criticism is not new, as both these gentlemen assume. The same objection has been raised before in these columns.

It is interesting to consider whether the proposed substitute is also an illogical contrivance. First a slip of the pen, which substantially changes the thought in Mr. Phillips' letter, may be noted. In comparing two yachts whose speed varies as 5 and 6 it is said: "The allowance should be one-sixth of the time of the larger, or one-fifth of the time of the smaller yacht." Apparently the words "larger" and "smaller" should exchange places.

An example makes plainer the proposed new method of calculating allowances for elapsed time instead of for distance: Take two yachts of 36ft. and 25ft. length respectively, a course of 12 miles, and an elapsed time of larger yacht 2 hours. Assuming that the speeds vary as

$$\frac{\sqrt{36}}{\sqrt{25}} = \frac{6}{5} = \frac{1.2}{1}$$

then the elapsed times vary inversely, that is  $\frac{1}{1.2}$ . That is to say, the elapsed time of the small yacht is two-tenths the longer, ( $1.2 \times 120m = 124m$ ). Therefore, an allowance to her of two-tenths of the elapsed time of the leading yacht ( $2 \times 2 \text{ hrs.} = 4m$ ) would make her corrected time equal that of the other.

This scheme of allowances may possibly be an improvement over the old one; but it is not a scientific one nevertheless. It is based upon the assumption that the difference of speed (supposed to vary as  $\sqrt{L}$ ) is constant for all winds. If this were true it is evident that the hourly loss in distance of the smaller yacht would be constant and would correspond with a constant fraction of the hour, no matter what the absolute speed. But in fact, this ratio is not constant. It varies with every change of wind force. In light airs and at low speeds small yachts do relatively better, and do not need so much allowance per hour as in heavy winds. The proposed plan allows the same proportion of the elapsed time of the leading yacht regardless of differences of speed and elapsed times.

The old plan starts out with the assumption that speed varies uniformly as  $\sqrt{L}$ , but in practice abandons the assumption as untrue in ordinary racing weather. The proposed new scheme starts out with the same assumption, though it manifestly is not true, and consistently maintains the false assumption to the end.

#### The Shenandoahs Cruise the Greenbrier.

BY F. R. WEBB ("COMMODORE"), OF STAUNTON, VIRGINIA.

#### The Story Which Won the Fourth Prize of \$10 in "Forest and Stream" Cruising Competition.

##### II.—The Log.

(Continued from page 177.)

MONDAY, JUNE 29, 1903.

DAY broke with a sky heavily overcast, and with rain imminent, and the outlook was not at all promising as I poked my head out of my snug little shelter at an early hour this morning; but it was not actually raining, so I rang the rising bell on George and we were soon astir; and after a hearty breakfast we struck the camp, packed the canoes, launched them, and leisurely got off. Incidentally I managed to procure some really nice cornmeal while here at Cass, and further experiments with the corn cakes proving entirely satisfactory they became a regular article of diet at our various camps, and proved a happy solution of the bread question, which has always been more or less of a problem on our various cruises. For the benefit of the coming generation of cruisers and campers I will give the formula—it's simple enough: For our party of two I took a scant half pint of cornmeal and mixed into it a heaping tablespoonful of flour; I salted the compound to what I judged was a sufficiency (every cook will have to be his own judge in this particular), and put in a small pinch of soda. (On getting home the head of my family informed me that I had eliminated the soda, and put in a small teaspoonful of Royal baking powder—no charge to the Royal people for this ad.—it would have been much better.) I stirred the dry compound until well mixed, after which I broke in an egg, and stirred it well, and then wet up the mass with water, stirring and mixing it carefully, until George said it looked like a first-rate article of chicken feed. A little lard was put into the frying-pan and renewed from time to time as the exigencies of the case required it, and the cakes fried over a quick fire, being handled and turned with one of those useful implements known as a cake turner, which, by the way, proved to be an all round useful tool at the camp stove during the cruise.

The river had risen somewhat during the night, and was coming up rapidly, and we had fully a foot more water than we had brought with us when we arrived; and the day's cruise promised to be lively, particularly in view of the fact that my U. S. Geological Survey chart had a couple of 100ft. contour lines crossing the river not far below Cass at distances of but little over four miles apart, and we quite expected to find some lively water with the good strong head we had. Our apprehensions in this respect were not materially quieted when an old lumberman who had run with the log rafts many times, and who happened along in time to lend us a helping hand in launching the canoes, remarked that there was a rapid a few miles below that he would "hate mightily to run in them blamed little boats!" However, if we could only have water enough to cover the infernal multitudinous rocks, we felt that we were willing to risk almost anything else that the river had to offer in the way of excitement, so we stepped aboard and carefully settled ourselves into our respective seats, and were at once caught up in the swirling current and whisked rapidly away down the river. We at once found that we would have but little trouble from the rocks, as, with the exception of here and there a big fellow which reared his shoulders out of the swirling stream, they were not at all in evidence; and these were easily dodged. As we came to the rocky reef at the mouth of Deer Creek, a mile below our camp, we were tumbled around over the rocks pretty lively, in our endeavors to avoid being swirled in under the overhanging bank in the sharp elbow, at the imminent risk of a capsize apiece, but this was the only time during the day's cruise that we touched a rock, or that a rock touched us. Deer Creek came in boiling, and spread at least six inches more water over the surface of the river; and the big waves in the rapid below caused us to hastily close our hatches to avoid being swamped as they rolled heavily over our decks and hatches. Every little side stream was contributing its quota to the sum total, and we had a head of water that carried us easily right over the tops of everything, and with water to spare, the while it bowled us along merrily at a gait of from six to eight miles an hour. We not infrequently came upon good sized islands dividing the river into two narrow channels, down which the water raced at a lively pace; we made it a point to take the channel furthest off from the railroad, no matter how small and unpromising it looked, and the sensation of shooting swiftly along under the overhanging branches, swishing in the water on each side of the

narrow channel, was pleasantly exciting. The immense fall was in evidence from the start, but instead of finding heavy, rough rapids, as we had anticipated, we found one general down-hill shoot of water without a foot of slack water in it at the present stage—a veritable watery toboggan slide, in fact, and the cruising was something to remember. It was probably the liveliest going we had ever experienced, not excepting our memorable "flood" run of eighty-five miles on the Shenandoah in our '93 cruise. We kept well off from the railroad embankment whenever we found ourselves coasting along at the foot of the road, otherwise we went pretty much where we pleased over the surface of the river; our hatches in place, with the aft section of the 'midship hatch with its apron ready to pull up over and around us at a moment's notice, for the water was rough. We found the big rapid which our pessimistic friend had warned us of, all right enough, but went dancing merrily down its tossing white-capped slope without any inconvenience or mishap, although we had a rather narrow squeak of it at the top.

The Old Bridge at Marlinton.

While bowling swiftly down upon the rapid, with our attention concentrated on the whitened slope below, we suddenly discovered ourselves right up against a ferry wire stretched across the river from side to side, but a few inches above the water—so close that it seemed impossible to avoid it. George, being near to one side, let his boat drive down on it, as it was high enough above the water at that point to let his bow slip under. When it reached him he dexterously caught it, and threw it over his head; but from my position in midstream it was not high enough above the water to allow my canoe to slip under, so all there was to do was to turn my boat quickly, bow up stream, and paddle desperately for a point nearer shore, and I finally drifted under the wire close enough in for it to go over the canoe, while I lifted it over my head. After this little episode, whenever we sighted a house near the river, or more particularly a railroad station on the bank, we made it our special business to keep an eye open for these ferry wires—a wise proceeding, for two or three more of them were picked up on the morning's run. The day cleared up as it wore on, and the sun came out and gave promise of fair weather once more. The scenery was extremely wild and interesting. For many miles below Cass the valley is so nar-

Camp Price—Marlinton.

row that it becomes a mere cañon. The mountains rise steeply from the water's edge, and tower aloft on either side up into the sky, their sides densely clothed with hemlock, spruce, and other timber, mostly of the evergreen species. The river turns and twists at the bottom of this gorge, never straight for more than a few hundred yards at a time, and we had mountains in front of us, mountains behind us, and mountains hemming us in to the right and left, until it seemed that we were hopelessly entangled in the mountains with no way out. The railroad skirted close along the right bank of the river, occasionally taking advantage of a few rods of bottom land in the angle of a bend to cut off a short distance. As usual, we kept well off from the railroad embankments at the bottom of the concave bends, as we were sure to find the river bed plentifully strewn with enormous fragments of rock hurled into the river by the blasts of the workmen in preparing the roadbed, and over which the water broke in foaming surges. There was plenty of water for us everywhere, so we had no trouble in avoiding these, although at a more normal stage of water doubtless some of the steep pitches down along this section of the river would have proved decidedly rocky. We swept swiftly by Cloverdale about the middle of the forenoon, where our curious looking boats, rapidly gliding by, attracted no little attention from the loungers around the railroad station; and a couple of hours later swung in to the bank at the bottom of a huge ox-bow bend to the left, which the railroad cut off by diving under the mountain. A clear little stream came brawling down the mountainside, and tumbled into the river in a transparent little cascade of a few feet in height over a flat ledge. The water proved to be quite cold, as we had expected, and we laid

by here for an hour and a half for a noonday lunch, rest, and siesta. Our morning's cruise had not entailed the least exertion on us, but we were tired and cramped from long sitting in the canoes, and the opportunity to get out and stretch our limbs was a welcome one. Incidentally this was the only day on this entire cruise in which we resumed our cruise after the noonday meal; all succeeding days' runs were terminated at lunch time, and camp was made and the afternoons devoted to loafing and fishing. Our afternoon's run was but a repetition of that of the forenoon. Swift water and plenty of it; rapids at every few hundred yards; no rocks or shoals to bother us; beautiful and striking mountain scenery, with here and there a farmhouse of the humble mountaineer type perched on the flank of a mountain spur, or nestling in some little nook made by an incoming stream; while the passing of an occasional train with a roar and a rattle that seemed as disturbing and out of place in the primeval solitude as did the gaseous smell of the coal smoke that remained to pervade the atmosphere for long after the train had passed out of sight and sound, served to remind us that we were still in a land inhabited by man and his creations. In striking contrast with the high water on the Shenandoah, the water was not at all muddy. It was somewhat discolored—quite too much so for fly-fishing—but I have fished the Shenandoah and other streams successfully with bait on frequent occasions, in water no clearer than was this. The Shenandoah, flowing as it does through a red clay country, well tilled, becomes of a thick, brick-red color after each heavy rain, from the surface wash off the adjacent tilled fields; but the Greenbrier, having no tilled land to speak of on this upper section—and no red clay lands tilled or otherwise—has no mud to wash into it after heavy rains, and the heaviest floods do little more than dis-color the water. There was entirely too much water for fishing, however, and George, who cruises principally to fish, and who always has his tackle mounted and ready to hand in his canoe, did not have it in evidence at all to-day. At the foot of the big ox-bend the railroad shot out from under the mountain and took a flying leap across the river on a handsome, well built iron bridge, and we had it on our left for the remainder of the day's cruise. At just 4 o'clock we rounded in under the picturesque old covered bridge at Marlinton, twenty-

A Landing for Lunch.

five miles below Cass by the railroad with a mile or two more to the credit of the river, having left that port at 9 o'clock. The run occupied seven hours, which included the hour and a half lie-by for lunch; and George and I at once voted it to have been one of the finest day's runs we have ever enjoyed, and of itself entirely worth the trip out here. I went up into the village for mail and supplies, and on my return found young Dr. Norman Price in his canoe, lying alongside of George, swapping yarns and experiences. I had had some previous correspondence from Cass with Dr. Price, relative to his joining us in his canoe for part or all of the remainder of our cruise, but his canoe being of light, folding variety, is not adapted to trips of this character, and his various cruises are taken at a still higher stage of water, so that there can be no liability of his mixing up too intimately with the rocks and shoals incident to a lower stage, and he was obliged to decline the invitation. He conducted us to a charmingly quiet, retired and shaded little bank for a camping place, at the foot of the grounds belonging to his father's residence, about a quarter of a mile below the bridge, and across the river from the village, and we soon had the canoes ashore and camp made up, including the dining fly, for it is our intention to lay over here a day or so, to let some of the superfluous water run off ahead of us. We have more than we need for cruising, now that we have reached this section of the river, and quite too much for fishing.

TUESDAY, JUNE 30, 1903.

We passed a quiet, uneventful day idly in camp. Although directly across the river from the village, our camp was as retired as though it had been miles away, and we were entirely free from the drawback incidental to camps near a town—the village loafers. The village was entirely convenient and accessible for supplies, mail, etc., and several trips were made during the day for that purpose. Marlinton is a product of the "boom" days of the early '90s and is the seat of justice of Pocahontas county, the county seat having been removed here from Huntersville at the time of that remarkable speculative fever, which swept clear out into these mountain fastnesses. It is charmingly located on almost the only bit of level land along the river, large enough to hold a town of any size—a triangular plateau formed by an opening in the environing mountains at the point where Knapp's creek, its largest affluent, joins the river. Like all towns projected in those inflated days, it is a city of magnificent distances, and straggles over an area of territory large enough for a town of many times its size; the handsome and complete new modern court house, and county buildings being a half or three-quarters of a mile from the business part of the town, which is clustered around the railroad station down near the river. From its favorable location, and with its newly acquired railroad facilities

it will doubtless increase materially in size and importance at no distant day, it being the center—both natural and artificial—of a large territory rich in native products of many kinds. We were kindly received by the people we met, and found much to interest us in the place. The evening was spent pleasantly and sociably at the Price residence. We were asked to go over into the village to a wedding at the hotel, but did not care to make the trip, and the noise of the accompanying old-time "charivari" came plainly across to us on the evening air, as we sat on the porch of the residence. The water ran down rapidly all day, and we turned in with the prospect of resuming the cruise in the morning on twelve or fifteen inches less water.

WEDNESDAY, JULY 1, 1903

We were out early this morning, and after breakfast we struck the camp, packed and launched the canoes and resumed the cruise on a foot and a half less water than we brought with us. It was but little after 8 when I pushed off into the stream, leaving George still on

Along the River.

the bank, and as I was caught up in the rapid current and swirled swiftly away down over the rift opposite our camp, I discovered that all of the Price people, young ladies included, had assembled on the bank to see us start. George was still ashore and bade them all good-by, while I had to content myself with waving my helmet.

We had a most lovely and interesting morning's cruise. The river is broader and the country rather more open than above. We passed the mouth of Knapp's creek a mile below our camp, and the river took on noticeably increased proportions in consequence. We noted a change of the general characteristics of the stream, as we had fully expected; the leaping and plunging trout stream seems to be merging into the more dignified and sedate bass stream, albeit the rapids were as plentiful as ever, mostly of the broad, shallow, gravelly bar character, calculated to make life a burden to the canoeist attempting the river in low water; but although we had some eighteen or twenty inches less water than we had on our Monday's cruise, we still had an entire sufficiency for our needs and quite too much yet for fishing, although George used his tackle all through the morning's cruise with considerable success, and we went into camp about a

The Big Dam at Cass.

o'clock with quite a respectable catch in his fish-bag. He fishes continually while cruising, using a short Henshall bamboo rod with agate guides, a fine silk line wound on a ball-bearing reel; and on the free end of the outfit one of those diabolical contrivances known as a phantom minnow—although to me it looks like a sardine—studded with gangs of hooks so that a bass, on making a dash for it—and if there is a lively bass within a hundred yards of the glittering, attractive object, he is pretty apt to make a dash for it—is morally certain to find himself hopelessly hooked somewhere about his anatomy, occasionally in the mouth. While I have occasionally used my fly tackle in cruising, as a rule I find that it takes about all of my available fund of skill and energy to successfully handle my canoe, even when the water is not difficult, and the addition of the fishing tackle is just that much extra work and distraction, consequently I have pretty much gotten out of the habit of fishing and cruising at the same time. George likes it, though, and invariably cruises that way, so as this was the first day on the cruise when the conditions were really at all favorable, we dawdled idly along down the exquisitely beautiful river, taking it easy in true idyllic cruising fashion at the same time making good steady time on the rapid river. George enjoyed the fishing as well as the cruising, while I took in to the utmost the beauties of the river; for the Greenbrier is a dream of beauty—a poem in water and mountains. We found it not nearly so difficult to run as the Shenandoah, although it has considerably more fall than the latter stream; the Shenandoah fall averaging about six feet to the mile. The principal difference is that the Shenandoah abounds

in long, still pools—not less than from one to two or three miles in length—where the fall is considerable, followed by a mile or so of rapids of the saw-tooth, reef-ledge order, where the fall of two or three miles is concentrated into the one mile, and often into considerably less than this distance, with the consequence that the Shenandoah falls and rapids are frequently long and always rough. The Greenbrier, on the other hand, has no pools that are over one or two hundred yards in length, and the rapids occur at correspondingly frequent intervals, mostly broad and shallow, and not particularly rough; and at a very low stage of water it is easy to see that this stream could not be run at all by a canoe, or in fact, by any craft. The Shenandoah never gets so low that we have been unable to cruise it, and we have run it on extreme low water on more than one occasion. To be sure, we do a good deal of wading, but we get down it without much difficulty; but with its constant succession of broad, shallow rapids, the Greenbrier would be quite impracticable at a low stage of water.

The numerous rapids gave us no trouble whatever on this morning's run, and we were not out of the canoes at all until we landed, at about the middle of forenoon, for a drink of water at a cold, sparkling little stream, which pitched down the mountain side and into the river over huge masses of rock. We were strongly tempted by the beauty of the spot to make this the end of the day's cruise, but decided to go on for a couple of hours and trust to luck for a camping place equally desirable. The valley opened up as we proceeded, and the scenery, while if possible, still more attractive, was not so wild and primitive. The railroad made another leap across the river, and we again had it on our right hand.

As we were drifting rapidly past the village of Sibert, nestled on the right bank under the everlasting shadow of the mountain, the up passenger train was just pulling out, and our novel little fleet attracted considerable attention from both train crew and passengers; the crew began to recognize us by this time from seeing us pretty much every day as they passed up and down on their daily runs. We went ashore at noon on a beautifully shaded rocky beach at the mouth of a clear, cold little spring branch and went into camp for the rest of the day. We had a quiet, enjoyable afternoon; we had a good swim in the cold waters; we read, slept, fished with fair success, and wrote letters; and after a good fish supper and a quiet smoke around our campfire we turned in, with the plan in mind to lie over in this attractive place for another day, to let several inches more of surplus water run off ahead of us, which, while materially improving the fishing, would still leave us plenty of water for cruising purposes.

[TO BE CONTINUED.]

## Shattemuc C. C. of Ossining, N. Y.

BY WILLIAM M. CARPENTER, TREASURER SHATTEMUC Y. C.

THE Shattemuc C. C. was organized in the early part of the month of December, 1884, the officers being as follows: Com., J. Herbert Carpenter; Captain, Wm. M. Carpenter; Purser, Thos. J. Hand, Jr. The membership numbered about twenty.

The first canoes in the club were of the canvas construction design, being constructed of paper and canvas over a frame of rattan ribs, with a heavy coat of white lead liberally applied to the canvas. A number of these were built by the members and used on the Hudson, weather and elements permitting. Their length was about 16ft.; paddles of 14ft. in length were at first used with the idea of balancing poles. From the birth of the club the interest grew, until it was necessary to seek larger quarters than those occupied on Wheeler's Dock. The Commodore, Franklin Brandreth, built a most comfortable and well planned building on his property near the upper dock, and here the club moved in the spring of 1886, still growing and taking its place, as the New York press had frequently to say in reports of regattas and cruises, as one of the leading canoe clubs of the State. In March, 1887, the crab was adopted as the totem.

The spring meet of the various clubs along the Hudson was held under the auspices of the Shattemuc on Croton Point, on Decoration Day, 1887. Speaking of this successful meet, one of the "dock rats" of the Newburgh Canoe and Boating Association had the following to say on the subject: "The cordial invitation of the Shattemuc C. C. to their brother canoeists to take 'pot luck' with them on Decoration Day seems to me to be about the right thing. The custom of a little meet along the river on that day was successfully started three years ago. Why give it up? Personally it meets my views to a fraction. The southern delegation should be a large one—good it always is; Brooklyn, New York, and Knickerbocker are generally there in force. It is too early in the season to speak of those Indians up at the frozen North, but nevertheless I hope to see the Mohicans out in force, and Rondout by that time will have given up ice-boating and should be ready to join in the 'love feast' at the Shattemuc beach—the 'corn dance' will come later up on Champlain. That there might be a 'mighty gathering' at each place to warm their toes at the big camp-fire and help 'roll the main down,' is the toast of a Dock Rat."

The Indians from the frozen North turned out in goodly numbers, and Wackerhagen, of the Mohicans, carried off the gold medal presented by Commodore Brandreth for the three-mile sailing race, class B; time, 40m. Wackerhagen also won the unlimited race in 17m., a silk banner being the prize, presented by Miss Secor.

With the exception of two or three years, the Shattemuc C. C. has been represented at the annual meet of the A. C. A. by one or more of its members. While the tendency has been to go into larger boats, especially on the Hudson during the past few years, there still remain in the present club house a number of canoes, both sailing and open. Consolidation of the club with the Sing Sing Y. C. being effected, the Shattemuc lodge was vacated, and the membership added to the yacht club roll. The name and flag of the S. C. C. was maintained, and thus the organization became as a wheel within a wheel, keeping its place among the canoe clubs and its members in the A. C. A.

The fleet has two divisions and two flags, as follows:

The yacht division has the club signal—a pointed flag; the device a red five-pointed star in the center of a white pointed ground five-twelfths the length of the flag, all on a red field. The canoe division has (the Shattemuc flag) a burgee, 18in. by 20in., blue field with 1½in. white border.

The present Shattemuc Yacht and Canoe Club was incorporated under the name of the Sing Sing Yacht Club on the 18th day of December, 1888, the officers being as follows: Com., Ralph Brandreth; Vice-Com., William W. Washburne; Sec'y, William B. Stewart; Treas., S. Olin Washburne; Meas., Benjamin R. Smith. The organization had a charter membership of thirty-five. There were only three catboats in the waters of the vicinity at the time the club was formed, but the fleet steadily grew so that it included some sixteen sails, when steps were

Shattemuc Canoe Club House.

taken in 1889 to erect the present club house on the river front, and from that time the organization became very flourishing. The sailing craft fleet, however, has given way to steam and power-boats of various designs, some twenty being now enrolled in the club, which has a membership of sixty, the names on the roster including a number of the prominent people of the village and the county. On the first day of April, 1902, the name of the club was changed from Sing Sing Yacht Club to the Shattemuc Yacht and Canoe Club of Ossining. "Shattemuc" is the Indian name for the Hudson River, and signifies "The river that rises in the mountains and flows to the sea." This was the name of the canoe club organized in 1884. The present officers of the club are: Com., Franklin Brandreth; Vice-Com., Gilbert M. Todd; Rear-Com., Edward B. Sherwood; Sec'y, William E. Barlow; Treas., William M. Carpenter; Meas., Roger M. Haddock.

### "Kweh!" and Eskers.

In the "Cruise of the Red and the Green," which appeared recently in these columns, I made two statements which, as further investigation has convinced me, need revision. The first concerns the spelling of the Indian salutation, "Kweh," so common in the Temagami country. Supposing the word to be of French origin, I spelled it, following French phonetics, "Quai," the pronunciation of which seemed closely to resemble the Indian salutation. Being unable, however, to discover any connection between "Kweh" and any French word, I consulted Mr. A. H. Chamberlain, of Clark University, who is acquainted with Indian lore. It seems that the word is Algonquin, perhaps borrowed from the Iroquois. Cnoq, in his *Lexique de la Langue Algonquienne* (Montreal, 1886), says (I translate): "Kweh! A salutation. It is especially used upon meeting a friend after one has been away a long time, and expresses a sentiment of pleasure. The Iroquois also use it, and the Algonquins may have borrowed it from them." So much for "Kweh!"

In speaking of the remarkable deposit of boulders in Diamond Lake, I said that the technical term for such a deposit was "esker." A subsequent search through a number of authorities on glacial action has failed, however, to find a definition or description exactly fitted to the deposit in Diamond Lake. The typical esker contains much more fine matter than is to be seen in Diamond Lake. That the deposit is the work of a glacier cannot be doubted by anybody who has seen it. The comparative absence of gravel and small stones may be attributed to the fact that the deposit is in the lake, whereas the typical esker is on dry land, and the action of the water and ice of the lake has doubtless produced the present character of the deposit. The fact that the lake is at that point very narrow with high and rocky shores has doubtless also had an influence.

A. L. W.

## Rifle Range and Gallery.

### Fixtures.

June 12-20.—National Schuetzenbund Festival, Union Hill, Schuetzen Park, N. J.

### Italian Shooting Society.

A two days' shoot of the Italian Society was held in the Zettler gallery on Feb. 20 and 22.

On the first day the shooting was principally on the wooden eagle, a style of German origin in this country. It consists in cutting down the bird part by part, from its crown to the body. The shooter who cuts down the last part of the body gets the principal prize. Among the Germans, to cut down the body means the honor of kingship of the organization. On this occasion, the last shot was made by Muzio, who is one of the veterans of the Italian club.

The second day, Washington's birthday was devoted to shooting on the ring target, three-shot scores, the two best to count. There was a large number of the members present. At the close of the contest there was only two points between the first and the eighth man.

During the evening the Italian Consul-General, Giovanni Branchi, and ex-Coroner Zucca visited the club, creating quite a diversion in the routine of the meeting.

A fine lunch was served by J. Piantanida.

The Consul-General congratulated the club upon the interest its members took in shooting, and also paid a high compliment to the Zettler Brothers for the fine appointments of their gallery and meeting room. At the close of the contest the winning scores were as follows:

Three-shot scores, 25-ring target, distance 75ft.; two scores to count; possible 150; first class: Minervini 149, Seloaggi 147, De Felice 147, G. T. Conti 147, Bianchi 148, G. Nicolo 147, Muzio 147, A. Navoni 147, Reali 144, Gerbolini 144.

Second class: D. Navoni 145, A. Orenigo 145, Buzzini 142, D. Mondine 140, Del Sole 138, Gatto 138, Rossotti 145, Ramondi 144, Munsch 141, Mastropalo 139, E. Orsenigo 138.

### Zettler Rifle Club.

The weekly gallery contest of the Zettler Club, Feb. 23, brought fifteen members together in competition for the club prizes. W. A. Tewes was high for the best 100 shots, with a total of 2439; L. C. Buss was second with 2435. Buss just missed a full score, his last shot being off from the 25-line by a hair. The target counted 249. The next best single score was made by Geo. Schlicht, 248. Schlicht made a full score on Feb. 2.

Ten-shot score, 25-ring target, distance 75ft., 100 shots: W. A. Tewes 2439, L. C. Buss 2435, Geo. Schlicht 2417.

Fifty shots: C. G. Zettler, Jr., 1214, A. Moser 1207, Aug. Kronsberg 1207, C. G. Zettler, Sr., 1202, E. Van Zandt 1202, Hy. C. Zettler 1200, Geo. Ludwig 1191, Aug. Begerow 1189, W. A. Hicks 1185, B. Zettler 1179, A. Rowland 1161, Thos. H. Keller, Sr., 1148.

### North Hudson Rifle Club.

Six members of the North Hudson Rifle Club attended the regular club shoot in Geo. Schlicht's gallery in West New York, N. J., on Feb. 21.

Ten-shot scores, 25-ring target, distance 75ft.: Geo. Schlicht 247, Capt. Andt 238, J. Hoffmann 221, W. Last 230, W. Hoppe 222, A. Metje 212.

### Rifle Notes.

A match between G. Worn and Chas. Rein, of Brooklyn, will be shot off on Breitkopf's gallery, Bushwick and Jamaica avenues, on March 6. The conditions are 50 shots per man, .22cal. rifles, distance 85ft. The stakes are \$25 a side. Chas. Rein was a member of the Zettler Club, and at one time was a good shot. G. Worn is a member of the Williamsburg Shooting Society, and is considered one of the best shots in the organization.

## Trapshooting.

If you want your shoot to be announced here send a notice like the following:

### Fixtures.

March 9.—Guttenburg, N. J.—Second annual three-man team championship; 10 birds per man; \$15 per team. Gus Greiff, Mgr., 255 W. 111th street, New York.

March 12.—Bound Brook, N. J., Gun Club all-day merchandise shoot. Stanley Brampton, Sec'y.

March 22-25.—Crawfordsville, Ind., Gun Club's tournament.

March 23-24.—Allentown, Pa.—Two-day target tournament at Duck Farm Hotel. C. F. Kramlich, Mgr.

April 6.—Sheepshead Bay, L. I.—Eastern amateur target championship, on grounds of Sheepshead Bay, L. I., Gun Club.

Aug. 10-12.—Brantford, Ont.—Dominion of Canada Trapshooting and Game Protective Association's fourth annual tournament. A. B. Cutcliffe, Sec'y.

Aug. 15-20.—Buffalo, N. Y.—New York State shoot.

Aug. 15-22.—Indian tournament; place determined later.

# DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

We are informed by the manager, Mr. C. F. Kramlich, that a two-day target tournament will be held at the Duck Farm Hotel, Allentown, Pa., on March 23 and 24.

A seven-man team match, Feb. 22, between the Columbia Gun Club, of Barborton, O., and the Akron, O., Gun Club was won by the Akron team by a score of 276 to 263.

The optional sweepstake re-entry shoot at live birds Feb. 22, on the Point Breeze racetrack was won by Messrs. James Cowan and Fred Muller with a score of 8.

Mr. E. Somers, of Easton, Pa., defeated all contestants in the live-bird competition at Bethlehem, Pa., on Feb. 22. Nazareth, Bangor, Pen Argyl and Easton were represented.

At Pottsville, Pa., Feb. 23, in a 9-bird sweepstake, there was a large entrance, the leaders being John Rorig, Smith, Showers and Krammes, each 7; Shaffner, Springer and Fulmer 6.

In a miss-and-out contest for a hammerless gun at Norristown, Pa., Feb. 23, Dr. Green, of Chestnut Hill, Philadelphia, killed 18 straight and won. Park was second with 17.

In a cup contest for the Montreal cup between five-man teams of the Westmount and Montreal gun clubs, at Westmount, Montreal was victorious by a score of 56 to 52.

The match between Messrs. Chas. Munson and A. K. Baker, at Lake Denmark, N. J., Feb. 22, resulted in a victory for Baker by a score of 40 to 39. The consideration was \$50 a side.

The Eastern amateur target championship will be shot at the Sheephead Bay, L. I., Gun Club grounds, April 6. The prize is a silver loving cup. The conditions are 100 targets, entrance price of targets.

In a contest for the Schmeltzer trophy, held recently at Vicksburg, Miss., between Messrs. W. R. Crosby and W. H. Heer, Mr. Crosby won by a score of 44 to 40, the conditions being 50 targets, reverse angles.

Mr. T. W. Morfey, of Dover, N. J., has accepted a challenge issued to him by Mr. C. W. Danser, of Freehold, N. J., to contest for the State championship at live birds. March 4 was fixed upon as the date, and Lake Denmark as the place.

At Shamokin, Pa., last week the gun club of that city held its annual club shoot for club supper. The main feature of the shoot was a team contest, eighteen men on a side, 25 targets per man. The scores were: Keiser's team, 247; Longshore's team, 246.

Mr. Elmer E. Shaner, secretary-manager of the Interstate Association, under date of Feb. 27, writes us as follows: "The Interstate Association has made arrangements to give a tournament at Grand Forks, N. D., July 27 and 28, under the auspices of the Grand Forks Gun Club."

Mr. J. J. Bradfield, secretary of the Vicksburg, Miss., Gun Club, informs us that May 17-18 are the correct dates for the Southern Trapshooters' Association's thirteenth annual tournament under the auspices of the Vicksburg, Miss., Gun Club, instead of May 23 and 24, as first announced.

The fifth annual tournament of the Territorial Sportsmen's Association is fixed to be held on May 19 and 20 at Oklahoma City, and is to be a big combined shoot of Oklahoma and Indian Territory, with \$300 added money. The programme will be issued on May 1. The secretary is Mr. J. C. Clark.

The Peters Cartridge Company live bird trophy was the main theme of contest at Little Rock, Ark., on Wednesday of last week, that being the second day of the shoot. It was won by Mr. John Dickinson. He and Mr. Powell scored 22 out of 25. Mr. Dickinson won in the shoot-off. Mr. Paul R. Litzke was the tournament manager.

The Carteret Gun Club, of New York, held their annual amateur championship contest on Feb. 22, in New Jersey. It is an event at 100 live birds. Mr. D. I. Bradley won it. At the 95th round, Mr. Geo. S. McAlpin led by three birds, but he lost three of his last five, thus tying with Mr. Bradley. In the shoot-off at 25 birds, Mr. Bradley won.

On Feb. 27 four five-man teams contested for superiority on the grounds of the Boston Gun Club. They represented the Harvard Shooting Club, the Watertown Gun Club, the Watertown Independents, and the Boston Gun Club. Each man shot at 50 targets from the 16yd. mark. Boston won with a score of 175. The Independents scored 170, Watertown 167, Harvard 165. The next match will be shot on the grounds of the Boston Shooting Association.

The list of officers elected at a meeting of the Savage Gun Club, Utica, N. Y., recently, is as follows: President, J. James Harper; Vice-President, William H. Bond; Secretary, George A. Booth; Treasurer, Robert H. Whitman; Captain, B. F. Langdon; Directors, J. J. Harper, Charles D. Wilson, William T. McKenzie, Thomas Padgman and George A. Booth. It will be decided later concerning whether or not to take in other than employees of the Savage Arms Co.

To the New York Athletic Club, Mr. H. Sauer has presented a gun as a prize, to be competed for in a series of the club shoots. The conditions will be announced later. Mr. Sauer returns to his home on March 22.

The Bound Brook, N. J., Gun Club has issued the programme governing their merchandise shoot of March 12. Shooting will commence at 10 o'clock. Lunch will be served on the grounds. There are thirteen prizes. Paid experts may shoot for targets only. To the two amateurs making first and second high averages, \$2.50 each. Shells sent care Dr. J. B. Pardoe will be delivered on the grounds free. There are fifteen events, 10, 15, 20 and 25 targets; entrance 30, 35, 40, 50, 55 cents, \$1 and \$1.50.

BERNARD WATERS.

## Trap at Gorgas Station, Pa.

THE unfinished shoot of the S. S. White and Highland gun clubs was resumed on Feb. 27 at Gorgas Station. The weather was pleasant. The scores in the postponed events follow:

No. 1, 10 targets, two prizes: Wentz 10, Stahr 10, Fountain 9, Dunlevy 9, R. Bisbing 9, Hinkson 9, Hammil 9, Harper 8, Huber 8, Ringgold 8, Parry 8, Reade 7, Denham 7, Cotting 7, Dedier 7, Lutz 6, Heite 6, Cantrell 6, Casey 5, Semper 5, Ballentine 4, Ewing 3, Valle 3, Nelson 2, Meehan 1.

No. 2, 20 targets, three prizes: Fountain 19, Harper 19, Cotting 18, Ringgold 17, Hinkson 17, Harper 17, R. Bisbing 17, Hise 16, Reade 16, Huber 16, Meehan 15, Stahr 15, Cantrell 15, Wentz 15, Hammil 15, Wayne 15, Dedier 14, M. Bisbing 14, Heite 13, Lutz 13, Nelson 12, Semper 11, Valle 10, Parry 9, Dunlevy 9, Green 9, Casey 8, Ewing 7, Ballentine 6. Shoot-off: Harper 9, Fountain 6.

No. 3, 20 targets, handicaps added to scores of White and Highland shooters: Dedier (0) 19, Cotting (1) 19, Stahr (1) 19, M. Bisbing (2) 19, Cantrell (3) 19, Harper (0) 18, Wentz (1) 18, R. Bisbing (0) 18, Hinkson (2) 17, Heite (3) 17, Reade (3) 17, Meehan (2) 16, Fountain (2) 16, Ringgold (4) 16, Denham (2) 16, Hammil (2) 16, Dunlevy (2) 16, Nelson (4) 15, Stahr (1) 15, Parry (3) 15, Wayne (2) 15, Ballantine (4) 13, Semper (4) 13, Valle (3) 13, Lutz (0) 13, Casey (3) 13, Huber (1) 12, Green (3) 12, Ewing (3) 9.

Highland Club shoot, 50 targets, handicaps added: Harper (0) 35, R. Bisbing (0) 35, Dedier (2) 35, Hinkson (2) 34, Wentz (2) 34, Meehan (2) 31, Hammil (2) 31, M. Bisbing (0) 31, Wayne (2) 30, Lutz (1) 27, Denham (2) 26, Dunlevy (3) 26, Green (3) 21, Ballentine (3) 20, Casey (0) 18, Ewing (3) 16.

## New York Athletic Club.

TRAVERS ISLAND, N. Y., Feb. 27.—The members of the New York Athletic Club spent a most enjoyable afternoon at the traps to-day. The weather was clear and cold, a perfect day for trap-shooting.

The main event was for a handsome silver loving cup. It was easily captured by Mr. Elias with a score of 33, and a handicap of 10 making a total of 43. Mr. Greiff was a close second. Two other trophies were shot for during the afternoon, for which Messrs. King and Greiff divided the honors:

Events:	1	2	3	4	5	6	7	8
Targets:	50	20	15	10	25	25	25	25
W J Elias, 10.....	43	11	8	6	14	15	16	17
C S King, 18.....	38	6	7	6	..	..	7	13
G E Greiff, 6.....	41	16	12	9	18	20	17	18
R Wood, 14.....	35	12	9	..	..	..	14	12
S Lund, 15.....	40	8	10	5	13	12	15	..
F McGraw, 10.....	40	10	8	..	16	15	..	16
G Morris, 0.....	26	13	11	7	..	14	12	..

Handicaps apply to first event only.

## Shamokin Gun Club.

SHAMOKIN, Pa., Feb. 23.—The two eighteen-man teams of the Shamokin Gun Club made a very close race in the annual supper contest, they finishing only one target apart. Each man shot at 25 targets. The scores:

Keiser's team—Keiser 18, D. W. Shipman 14, B. Robins 19, George Tovey 13, Frank Erdman 15, Doc Boughner 14, F. A. Godcharles 11, John H. Snyder 9, Henry Kaseman 16, B. B. Smith 19, G. R. Hanley 7, L. Goss 13, John Gessner 16, W. T. Wary 14, Ray Weaver 11, Joseph Wallish 10, John Jones 18, John Oram 10; total 247.

Longshore's team—Longshore 18, H. R. McCow 16, S. North 21, M. L. Sober 15, J. W. Richie 19, Bert Malick 19, D. G. Seiler 12, E. O. Chamberlain 2, Bud Thomas 13, F. G. Seiler 7, H. Sowers 18, H. O. Hoover 19, J. E. Herrold 16, W. E. Erdman 14, E. E. Mineral 13, G. H. Wilson 12, D. Boughner 9, William Fulton 12; total 246.

## Fairview Gun Club.

Fairview, N. J., Feb. 22.—The weather conditions were a hazy atmosphere and a southwest wind. The main event was for the Fairview cup, open to members only. The cup becomes the property of a member who wins it three times. The conditions were 25 targets, handicap allowance; entrance \$1; Sergeant system. The scores:

R Macleese, 15.....000101010111100101010100—25  
I Lawrence, 6.....1010111010101101110111—25

Wm Burdett, 9.....010101100101010110011001—23  
Shoot-off: R. Macleese won out on the third target.

ROBT. J. HOPKINS, Sec'y.

## Ohio Items.

THE Davis Gun Club, of Dayton, O., has elected the following officers: Henry Burkhardt, President; Chris. Pabst, Secretary and Treasurer; Elmer Lewis, Captain; Trustees, Alford Landis, Walter Apple, Joseph Elsen. The club will hold shoots every Saturday at the old grounds on Huffman Hill, and all trapshooters are invited to attend them.

The Springfield, O., and South Side gun clubs were consolidated on Feb. 22. The grounds at Tecumseh Park will be abandoned and new grounds on Rice street, near Springfield, will be fitted up with all modern conveniences.

Capt. A. F. Kempert, of the Gem City Gun Club, Dayton, O., announces that the club is ready to meet all comers in a team shoot of any number of men.

BONASA.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

## Keystone Shooting League.

HOLMESBURG JUNCTION, Pa., Feb. 22.—The holiday shoot of the Keystone Shooting League to-day had a good attendance. A field gun was the prize in the main event, a miss-and-out at live birds. Re-entries were limited to three. Messrs. Shew and Adams were tied alone in the eighth round and divided the price of the gun. Shooting off the sweepstake Adams won. The scores:

Prize shoot, miss-and-out, live birds; scores by rounds: Adams 8, Shew 8, Harrison 7, S. J. C. 7; Adams 5, Jenkins 5; F. Coleman 4, E. Coleman 4; Morris 3, McCoy 3, F. Coleman 3, Landis 3; Felix 2, Frank 2, Landis 2, Harrison 2, E. Coleman 2, Morris 2; S. J. C. 2; Luther 1, Felix 1, Adams 1, Shew 1.

Miss-and-out, live birds, \$2 entrance: F. Coleman 3, Luther 3, Frank 2, Adams 2, McCoy 2, Morris 1, Budd 1, E. Coleman 0, Landis 0, Felix 0.

Miss-and-out sweepstakes, live birds, \$2 entrance: McCoy 5, Morris 5, F. Coleman 5, Frank 5, Budd 5, Luther 5, Felix 5, Shew 1, Landis 0.

Twenty-five targets, entrance \$1: Shew 21, Luther 21, Adams 20, Eames 19, Morris 19, Landis 18, S. J. C. 17, Morris, Jr., 12.

Twenty-five targets, entrance \$1: Coleman 22, Luther 20, Frank 20, Landis 19, Shew 18, Harrison 18, Budd 17.

Feb. 27.—The shoot of the Keystone Shooting League to-day at live birds and targets had an attractive programme. A miss-and-out, the prize of which was a field gun, was the main event. One re-entry was allowed. Messrs. Fred Coleman and Frank Eames tied on 10 straight. The scores in the first entry and re-entry follow:

	1st.	2d.		1st.	2d.
Coleman, 31.....	10	5	Harrison, 28.....	1	8
Eames, 30.....	5	10	Jenkins, 27.....	3	6
Budd, 30.....	9	0	Roberts, 27.....	3	0
Smith, 27.....	4	2	Morris, 27.....	1	0

In the event at 10 live birds, Fred Coleman and I. Budd scored the whole 10, and Jones, Morris and Harrison divided second on 9. The entrance was \$5, three moneys. Coleman and Eames divided first in the third event at 7 live birds, handicap, \$3 entrance:

Ten birds:

Morris, 27.....2122222110—9	Coleman, 31.....2222222222—10
Eames, 30.....022202222—8	Budd, 30.....1111212212—10
Smith, 27.....211*111202—8	Jones, 28.....2212220222—9
Morris, Jr., 26.....2020101222—7	Harrison, 28.....1012121212—9
Campbell, 27.....0002*01120—5	

Seven birds: Morris 7, Smith 6, Budd 6, John 6, Coleman 5, Campbell 5, Eames 4, Jenkins 4.

Five birds, handicap rise, one barrel, \$2 entrance, three moneys: Eames 5, Coleman 5, Morris 4, John 3, Smith 2, Muncer 2, Budd 1, Meyers 0.

Twenty-five targets, Sergeant system, 50 cents entrance, three moneys: Coleman 25, Eames 22, Budd 21, Smith 19, Jones 19, Harrison 18, Morris 18, Campbell 13, Morris, Jr., 12.

Twenty-five targets, same conditions: Coleman 24, Jones 22, Eames 22, Harrison 21, Budd 19, Smith 19, Morris 18.

## Rochester Rod and Gun Club.

ROCHESTER, N. Y., Feb. 22.—The spring series of Rochester Rod and Gun Club contests began to-day. They are handicap events. The handicaps are changed after each contest by the handicapper, Mr. F. C. Cutting. Messrs Stewart and Fraley tied on 22, but as Stewart is a scratch man and Fraley had 4, the latter won the event. The conditions are 25 targets to constitute a string and 25 to be a perfect score.

Each shooter, should he score, with his added allowance, more than 25, will have the excess deducted from his handicap on next string. And should his score be less than perfect with the added allowance, he will have added to his handicap on next string one-half of the number of targets that he fails to score under the 25 mark, the club always taking the benefit of the fractions. The shoots will be held on each and every Wednesday to and including Wednesday, April 27, 1904.

Contestants may shoot up back scores any Wednesday. Total scores to count for prizes. The scores:

	Hdcp.	Brk.	Tot'l.		Hdcp.	Brk.	Tot'l.
Clark .....	4	20	24	Adkin .....	2	19	21
Fraley .....	4	22	26	Kershner .....	2	20	22
J C Powers....	5	18	23	Snow .....	4	19	23
Siebold .....	5	18	23	Bonbright .....	2	20	22
Stewart .....	0	22	22	Watson .....	4	16	20

Feb. 24.—There were four full scores made in the second contest of the Rochester Rod and Gun Club prize series to-day.

Several members of the Canandaigua Sportsmen's Club were visitors and contestants. They promised to come again in a few weeks. The Rochester Club will arrange a programme of events specially for them.

Spring handicap scores:

	Hdcp.	Brk.	Tot'l.		Hdcp.	Brk.	Tot'l.
Watson .....	6	20	25	Siebold .....	6	16	22

George .....	6	19	25	Norton .....	4	15	19
Fraley .....	3	20	23				

## York City Gun Club.

YORK, Pa.—The following scores were made at the last shoot, Feb. 22, of the York City Gun Club. The morning was rainy, and the afternoon was very windy, which helped to make low scores. Mr. D. S. Daudt, the manager of the State shoot, to be held in York, Pa., May 16 to 21, was with us at our shoot, and at the State shoot committee meeting Mr. McSherry was high gun with 175 out of 200; Hummer 168, Davy Deardorff 157. Mr. Deardorff is the oldest gentleman belonging to the club, and Davy said if his eyesight was as good as the other young ducks who were shooting, he would lay them all in the shade, and I think Davy is right.

Events:	1	2	3	4	5	6	7	8	9	10	Total.

## Cincinnati Gun Club.

THE attendance on Washington's Birthday, Feb. 22, was fair. The weather was cold and clear. Some good work was done. Seven events at 20, two at 15 and two at 25 targets, a total of 220, were shot.

The challenge issued by Gambell and Barker to shoot a series of ten 100-target races against any two resident amateurs of the club, was accepted by Medico and Davies, and the first two matches of the series were shot to-day. Messrs. Gambell and Barker won both of them by a total of 251 to 320, which gives them a good lead of 31, with 800 more targets to be shot at. Barker shot in most excellent form, steady as clockwork, and scored 91 and 90. Medico was high gun in the two races with 94, but he fell off to 82 in the second 100.

Ackley shot in six of the regular events, and was congratulated on the good showing he made.

Barker made the longest run in the races, breaking 43 straight in the first match. Medico's longest run was 32 in the same race. The scores, in a series of 20 targets, follow:

Gambell	16	17	17	17	18	18	85
Barker	17	19	20	17	18	91	176
Lavies	12	12	14	14	15	67	
Medico	19	20	18	19	18	94	161

Second challenge two-man team match:

Gambell	16	17	17	18	17—85
Barker	16	19	19	16	20—90—175
Medico	15	19	14	17	17—82
Davies	19	13	18	12	15—77—159

Total of both matches:

Gambell and Barker 351. Davies and Medico 320.

Regular events, Washington Birthday's shoot:

Events:	1	2	3	4	5	6	7	8	9	10	11	Total.
Targets:	20	20	20	20	20	20	20	20	20	20	20	143
Maynard	13	15	17	17	16	14	14	15	22			102
Captain	13	12	13	12	14	12						60
Jay Bee	14	16	17	13								57
Williams	12	15										32
Colonel	8	10	2	9	3							68
Ackley	14	8	14	10	12							79
Fredericks	14	15	14	15								27
Don Minto	15	12										69
Anderson	15	16										32
Sampson	12	11	9									41
A. Sunderbruch	14	15	12									48
Barker												60
Medico												45
Gambell												18
Davies												

The air was cool on Feb. 27, but not too much so for comfort. There was a light southeast breeze. In the cash prize shoot high gun was won by Don Minto, with 46, a score which is nearer to his gait of a few months back. Roll was second, with 44, followed closely by Sunderbruch, with 43.

President J. B. Mosly, chairman; H. F. Jergen and Dr. A. B. Heyl, tournament committee, have prepared an exceptionally attractive programme for the third annual handicap target tournament of the club. The club offers \$2,200 in added money and guaranteed purses, and is prepared to take care of three hundred or four hundred shooters.

G. W. Schuler, Emil Werk and the rest of the party which visited Florida a short while ago, returned home the first of the week. They had some good shooting and fishing, the latter especially being excellent, bass, sheepshead and red-snappers giving them most of their sport.

Lou Ahlers is slowly recovering from his sickness and will be at his old sport of smashing targets before long.

Falk's score of 36 to-day is very good, when it is taken into consideration that he is suffering from a broken rib and his side was encased in plaster; left-quarterers he simply could not touch.

Ackley is doing much better since the weather moderated a little, and not a man on the grounds but what would be tickled to see him break 'em all every time.

Cash prize shoot, 50 targets: Don Minto (16) 46, Roll (17) 44, Sunderbruch (19) 43, Faran (17) 42, Maynard (18) 41, Pohlar (17) 41, Medico (19) 40, Block (17) 40, Osterfeld (17) 39, Harig (17) 38, Williams (17) 38, Gambell (16) 37, Falk (17) 36, Ackley (16) 36, Pfeiffer (17) 36, Boehl (16) 36, Linn (18) 35, Plunkett (16) 35, Captain (17) 34, Willie Green (17) 34, Bullerick (17) 33, Muhleman (16) 33, Jack (16) 32, Norris (17) 22.

Match, 25 targets: Medico 23, Norris 21; total 44. Roll 19, Osterfeld 23; total 42.

Match, 25 targets: Medico 24, Gambell 21.

BONASA.

## Boston Gun Club.

Boston, Mass., Feb. 27.—Forty-three shooters were convinced at the Boston Gun Club's afternoon shoot to-day that a Leggett trap came as near to perfection as could be.

Every one was there, judging by the names that appeared on the score board. Bob Root and Arnold, traveling from Providence; Griffiths, from Pascoag; Coffin, Burbank, Johnson and Hamlin, from Whitinsville; Rule, from Lowell; Worthing, from Brockton; Frank, Hay and Everett, from Lynn; and a score of others from the various other clubs in Boston and vicinity.

The occasion of this shoot was the first corner in the team match between Harvard, Watertown and Boston gun clubs, one shoot to be held on each grounds, and the team breaking the greatest number of targets to be declared the winner.

As will be seen by the score, the Boston team, under Capt. Woodruff's able management, secured a 5-target lead over the Watertown's Independent team, though the scores were much lower than we had reason to expect. The conditions, however, were not conducive to high averages, as the northeast wind and intermittent snow most certainly played a big figure, for no sooner did the shooter get in position than a gust of wind would change the whole situation, and those who labored under the disadvantage of spectacles, etc., were handicapped with the snow-flakes, in ways that the others were unable to realize.

Three thousand eight hundred and fifty targets were trapped in just over four hours, something which has never been done before on our grounds, and does great credit to the shooters, showing that they were ready to shoot and in their positions at the proper time, helping the squad hustler not a little, as the most disagreeable part of a large shoot is a squad that is never ready.

The club, while having a fair amount of help ready for work, was not quite prepared for the sized shoot it turned out to be, and we are very much indebted to Hodsdon, of the Watertown club; Straw, Everett and Frank, of the Birch Brook Club; Lane, one of the club's regular attendants, though not shooting to-day, and Collins. Without the help of these ever-ready helpers, the B. G. C. would have been a trifle worried; but having such friends on our list, it seems as though we were always taking advantage and remaining in their debt. We hope to be able to return the compliments soon, as trapshooting is on the rise now, and all clubs will start up for summer series within the next few months.

The compiler of scores, F. P. Miller, was easily kept busy during the entire afternoon, but he was there and ready, the announcing of the winners and individual leader being im-

mediately upon completion of event No. 8, and causing considerable talk as to the correctness and quick way of keeping results.

Individual honors of the shoot were ably taken care of by Baldwin, the old Pennsylvania crack, making his initial shoot on these grounds quite a memorable one, and though pushed to the limit by Burbank, a well placed 15 straight clinched the lead by just one target.

The club's regular attendant, Frank, was very close to both, 82 out of the 100 targets being his effort, a loss of 13 targets out of the first 50 being disastrous, as the last half netted an even 45.

The next shoot in this series will take place on the grounds of the Boston Shooting Association, under the auspices of the Harvard Shooting Club, and will go quite a ways toward picking out the winner. Other scores:

## ON LONG ISLAND.

## Brooklyn Gun Club.

Brooklyn, N. Y., Feb. 22.—The scores made at the Brooklyn Gun Club holiday shoot follow:

Events:	1	2	3	4	5	6
Targets:	25	25	25	25	10	15
Kelly	19	23	22	9	12	
Bergen	15	18	12	19		12
Dwyer	18	15	15	18	2	9
Hitchings	19	15	18	19		
Howard	8	14	16	15	5	9

No. 5 was at 5 pairs.

## Crescent Athletic Club.

Bay Ridge, L. I., Feb. 27.—The weather was pleasant, there was a good attendance of active shooters, and competition was well sustained at the shoot of the Crescent Athletic Club to-day. Capt. A. W. Money, H. Werleman, G. G. Stephenson and L. M. Palmer won trophies.

The February cup was won by Mr. L. C. Hopkins without any fourth contest, his three wins, each with a full score of 25, being a definite settlement of the February cup competition. Nevertheless, trophy shoots and the team shoot engaged the full attention of the contestants. The scores:

Trophy shoot, 15 targets, handicap: G. G. Stephenson, Jr. (1) 15, O. C. Grinnell, Jr. (4) 14, W. W. Marshall (3) 13, A. G. Southworth (0) 13, L. M. Palmer, Jr. (0) 13, F. B. Stephenson (0) 13, L. C. Hopkins (1) 13, Capt. Money (0) 12, E. H. Lott (0) 12, H. B. Vanderveer (1) 11, F. T. Bedford, Jr. (1) 11, William Sherer, Jr. (4) 10, Dr. O'Brien (2) 9.

Sykes team cups, 25 targets, handicap: Southworth (1) 19, Marshall (5) 19; total 38. Hopkins (3) 22, Money (1) 19; total 41. Lott (1) 23, Vanderveer (3) 20; total 43. Stephenson (1) 24, Stephenson, Jr. (2) 21; total 45.

Palmer trophy, 25 targets, handicap: Capt. Money 25, F. B. Stephenson 21, F. T. Bedford, Jr., 20, E. H. Lott 19.

Trophy shoot, 15 targets, handicap: L. C. Hopkins 15, Werleman 14, Bedford 14, Money 14, Palmer 13, F. B. Stephenson 13, Southworth 12, Lott 12, Dr. O'Brien 11, G. G. Stephenson, Jr., 11, Notman 10, Sherer 10, Vanderveer 10, Marshall 7.

Trophy shoot, 25 targets, handicap: Werleman 25, Bedford 23, Money 22, Hopkins 22, Notman 22, Palmer 21, G. G. Stephenson, Jr., 20, Marshall 20, F. B. Stephenson 19, Dr. Raynor 19, Southworth 18, Sherer 18, Grinnell 16, Dr. O'Brien 13.

Trophy shoot, 15 targets, handicap: Capt. Money 15, Hopkins 13, Sherer 13, Werleman 13, Palmer 13, O'Brien 12, Grinnell 12, Marshall 10.

Trophy shoot, 15 targets, handicap: Palmer 14, Sherer 13, Hopkins 12, O'Brien 12, Notman 12, Werleman 12, Marshall 11, Money 10, Grinnell 7.

Trophy shoot, 15 targets, handicap: Werleman 14, Palmer 14, Grinnell 14, Money 12, Marshall 10, Notman 9, Hopkins 8. Shoot-off, 15 targets, handicap: Werleman 14, Palmer 13, Grinnell 10.

## Sheepshead Bay Gun Club.

Sheepshead Bay, L. I., Feb. 25.—Two members of the Sheepshead Bay Gun Club selected this day to decide a match of which the loser had to pay for a dinner for twenty-five men to be served at Mr. Ira McKane's hotel. It was thoroughly enjoyed by all shooters present. The scores were not very high, the result of a cold gale blowing across the traps. Mr. Montanus had to allow his opponent 10 targets in 50, and won by only one target.

Dinner was served to twenty-one men. Scores: H. Montanus 21, Theo. Knuth, 10, plus 10 handicap, 20.

Sweepstakes:

Events:	1	2	3	4	Events:	1	2	3	4
Targets:	25	15	20	20	Targets:	25	15	20	20

G E Greiff	17	12	16	16	Montanus	14	10	13	14

Feb. 22.—The Sheepshead Bay Gun Club held a successful shoot on Washington's Birthday and were especially interested in the long-talked-of match between Mr. Ira McKane, of Sheepshead Bay, and Mr. Geo. Delany, of Atlantic Highlands, N. J., which was a 100-bird race for \$100.

Twenty men shot for a special holiday cup, handicap allowance. Mr. Williamson came out the winner.

Main event, 50-target handicap:

Hdcp. Brk. Tot'l.	Hdcp. Brk. Tot'l.
J Pillion	18 27 47
H Williamson	16 34 50
H Kronika	20 26 46

# A COLD WINTER

OFTEN  
MAKES  
AN  
EARLY  
SPRING.

THE SMILE THAT WON'T COME OFF.

AND in the Spring man's fancy turns to thoughts of "fishing." To the man who loves the art of angling, his tackle is of interest twelve months in the year—that is if it is good tackle. It is always before the fishing season opens that he begins to overhaul what he has on hand in anticipation of joys to come. It is largely possible that the haunts of years before are to be forsaken and new territory invaded. This may mean different rods, different lines, different reels and different flies.

We, as dealers, try and keep pace with the ever-changing thoughts of man, and are better than ever prepared to supply for this season the best goods that we have ever shown.

**Our Touradif Rod sells for \$20.00  
and the Bic Rod for \$15.00**

We positively guarantee every rod, and if any one should prove unsatisfactory, we will cheerfully refund the purchase price. We certainly could not afford to make this offer if we did not know what we were talking about. While rods are the principal article of every fisherman's cabinet, we have taken an equal amount of pains with the requisities that go with the rods. There is nothing that a man needs for fishing in any waters that we cannot supply.

*We can furnish you with everything necessary  
for a trip to any part of the world.*

If you cannot call on us, send 10 cents for our 240 page catalogue. It contains many dollars' worth of information.

## ABERCROMBIE & FITCH,

Manufacturers of Complete Outfits for Explorers, Campers and Prospectors,

314-316 BROADWAY, NEW YORK, U. S. A.

## "FISHING ON THE PICTURESQUE ERIE,"

A Beautifully Illustrated Booklet, containing valuable articles on fresh water fishes and fishing, written by veteran anglers, and a complete and reliable directory

DELAWARE RIVER VIEW.

TROUT STREAM.

to the lakes and streams along the lines of the Erie, where the best sport may be found. New and enlarged edition for 1904 will be ready for distribution about April 1st, and can be obtained from any Erie ticket agent in New York City and Brooklyn, or by sending five cents in stamps to the undersigned.

**THE BLACK BASS FISHING** in the upper Delaware is unsurpassed. The Erie follows the course of this beautiful river for over sixty miles.

**TROUT STREAMS** too numerous to mention, but the Erie Fishing Book will tell all about them.

**"RURAL SUMMER HOMES."** An illustrated directory to the Hotels and Boarding Houses in the beautiful Summer Land along the Erie, will be ready about April 1st. Free, on application to Erie ticket agents, or by sending six cents in stamps, for postage, to

**D. W. COOKE, General Passenger Agent, NEW YORK.**

## A WORK OF WIDENING IMPORTANCE TO THE BOOK WORLD.

TEN SUPERB LARGE VOLUMES.

January 9, 1904.

J. P. JENSON, Crookston High School, Crookston, Minn., says:

The **NATURE LIBRARY** far surpassed my expectation. I have already made good use of the books in my work as Science Instructor, and I know that I shall derive information from them for many years to come. The color plates are excellent, the arrangement scientific and yet simple, and the binding substantial. Fifteen dollars would not buy my set if I could not get another.

300 plates in full color.

500 other reproductions from photographs from life.

1,500 text cuts,

4,000 pages.

5 1/4 x 8 1/4 inches.

January 12, 1904.

AARON L. TREADWELL, Professor of Biology, Vassar College, Poughkeepsie, N. Y., says:

Doubleday, Page & Co. are to be congratulated on the general excellence of the books comprised in their **NATURE LIBRARY**. It is the most valuable series I know for the use of the Nature lover, whether he is interested professionally or non-professionally in natural history subjects.

## THE NATURE LIBRARY.

For six years we have been working steadily to build up **THE NATURE LIBRARY**, and have spent many thousand dollars to bring it to its present form of ten beautiful volumes. The set has become a standard work—the only one of its kind in the world—and the sale has increased very rapidly, more than ten times as many being sold this season as last. There is no household in the land where these books are not needed; for grown people, for schools, for children, for everyone who wants to know about birds, flowers, butterflies, mushrooms, insects, etc., this set is absolutely indispensable.

**JOHN BURROUGHS** in his introduction well expresses the spirit of the books. He writes: "While accurate and scientific, I have found them very readable. The treatment is popular without being sensational."

We have made a book which to some extent expresses the beauty of **THE NATURE LIBRARY**. It contains some of the colored plates, several of the photographic reproductions, shows text pages, and so far as is possible describes the great work.

Cut off and send to us this coupon with your name and address, and the book will be sent you, with full information as to prices and terms. You incur no obligation.

### Akron Gun Club.

THE annual holiday shoot of the Akron, O., Gun Club, held on Washington's Birthday, Feb. 22, was a very successful affair, forty-eight shooters participating in the different events.

The weather was not what is known as "ideal for the sport," as a strong wind was blowing most of the day and made the shooting very difficult.

Ralph Trimble was the guest of the club. High gun honors were divided by Wagoner and Haak, each of whom broke 127 out of 150. Bradley was second with 126.

It was intended to have decided the championship of Summit, Portage and Stark counties by a match between teams of the Canton and Akron clubs, but owing to the illness of several members of the former team the contest was postponed.

The Akron club agreed to match any number of men which the Columbia Gun Club, of Barberton, O., would bring to the score, and the latter showed up with seven. The match was shot, and the Akrons won, 276 to 263. The scores in the programme events follow:

Events:	1	2	3	4	5	6	7	8	9	10	11	Shot
Targets:	10	15	10	15	10	15	10	15	15	20		at. Broke.

### Arkansas Championship.

LITTLE ROCK, Ark., Feb. 25.—The two days' shoot under the management of Paul R. Litzke, which was scheduled for Tuesday and Wednesday, was fairly well patronized by both local and visiting sportsmen. Tuesday, the first day, was devoted to sweep-stake shooting, and a number of 5-bird events were shot. The money in these was cut up by Chenault, Dickinson, Bragg and T. Omohundro. Of these, young Guy Chenault showed to the best advantage, as he quit with 19 out of 20 to his credit.

Wednesday was the most important day of all, as it was then that the contest for the Peters Cartridge Co. live-bird trophy, emblematic of the championship of the State, took place. This proved to be an interesting contest throughout, as it was nip and tuck between Dickinson, Powell and Conroy up to the very finish, and ultimately resulted in a tie between the two first named, as Conroy experienced a bad few minutes just at the very close, and lost his last two birds. Powell looked like a winner up to the very last round, as he then led Dickinson one bird, and to kill his last one meant the retention of the trophy for him. However, he failed to prove equal to the occasion, as he let this, not a hard one, beat him out; and as Dickinson killed, they were tied with 22. This necessitated a shoot-off, and here Powell missed his first, while Dickinson killed out straight, and thereby secured the championship and the trophy.

Gibson Thibault shot under great distress. Some time ago he had the misfortune to have his right hand caught in a gin, and this was so badly lacerated as to necessitate the amputation of

the thumb, and with the hand still bandaged, he entered the contest nevertheless, and shot a little 20-gauge gun from his left shoulder and succeeded in scoring 17.

Dickinson, Jr., is the fourteen-year-old son of John W. Dickinson, winner of the trophy, and this youngster gives every indication of soon being able to compete on equal footing with the best shots in the State.

The senior Dickinson is a local shooter, who some years ago was quite a factor in the sport; but he has shot little of late owing to a growing business, which requires most of his attention. It is evident, however, that he has lost none of his old-time skill.

Nick Peay, another local shooter, immediately challenged the winner, and the match will take place within the next thirty days.

After the main event a miss-and-out was started, and this was won by Fred Bragg on the sixth round, at which juncture the other nine contestants came to grief.

During the afternoon Capt. Geo. E. Bartlett, expert with shot-gun and rifle, gave an exhibition of his skill that was both interesting and entertaining to the sportsmen and spectators present. Nothing that could compare with the feats he accomplished has ever been witnessed in this locality. The puncturing of small pieces of quarter-inch boiler plate steel thrown in the air with a .30-30 soft-point bullet was a revelation to many. Numerous other feats, equally as difficult, were performed by the Captain with the .32-20 and the .22 rifle, also others with the shotgun. The wonderful cleanliness of the little .22-short was also demonstrated by firing 200 shots through one of these rifles and passing it around for inspection to show the absence of any fouling.

On Thursday afternoon a five-man team race at 20 live birds per man was shot between two teams of local shooters for a supper and the price of the birds, scores of which are given below:

Championship match, 25 live birds per man, Interstate rules, 30yds. rise:

### Trap at Wilkes-Barre.

WILKES-BARRE, Pa., Feb. 24.—J. D. Mason and Frank Spencer, of Scranton, won first and second high average at a shoot held here to-day, Spencer breaking 155 out of 175 and Mason 151 out of 175. The trade was represented by G. R. Benjamin, who officiated as referee, making many friends for the goods he represents and for himself also. The weather was cold and rainy, and disagreeable, with a dark sky and heavy wind. Twenty-four hundred targets were thrown in the regular events; 500 in practice events. E. L. Kipple managed the shoot.

### Montreal—Westmount.

ENOSBURG FALLS, Vt., Feb. 22.—It amuses us old Canadian trapshooters to hear the boys in this country complain about it being a cold day when out at the traps with the temperature up several degrees above zero.

Below are the scores of a team race between the old Montreal Gun Club and the Westmount Club, which was shot on the Westmount grounds on the 13th inst., with the mercury away down below zero, and in a heavy wind, with the snow flying to beat the band. It kept the scores down, but the boys enjoyed it, though they do admit that one day it was so cold that the birds froze stiff and dead in the air, and there remained motionless. There is nothing wonderful about this, you know, for, you know, a dead bird is incapable of motion, you know.

This team match was for the Montreal cup:

STANSTEAD.

### Squad News.

MOBILE, Ala., Feb. 22.—Before a large and enthusiastic gathering, and with weather conditions most favorable, the U. M. C. Southern Squad gave a fine exhibition of trapshooting here to-day.

The squad members were in very good form, and especially impressed the local sportsmen by the courteous and congenial manner in which they mixed up with the crowd. Riehl, who has been with the squad most of the time, settled down to phenomenal form, winning a hot race by the score of 99 out of 100, making a run of 85 straight. Adams tied for second place with 95 out of 100.

The squad leaves to-night for Pensacola, Fla., where they give an exhibition shoot. The scores at 100 targets follow: Marshall 93, Heikes 91, Budd 84, Heer 85, Anthony 87, Riehl 99, Adams 96, Elliott 95.

PENSACOLA, Fla., Feb. 23.—The Dixie Gun Club to-day had the honor to entertain the U. M. C. Southern Squad, who are on a three months' trip touring the South, making the acquaintance of sportsmen and promoting trapshooting in general.

Everything went off in fine shape, a large crowd turning out to see the exhibition. However, had the weather conditions been a little more favorable, better scores would no doubt have been made. The local shooters shot in good form, and much interest was aroused on all sides. The squad will always be received here with open arms as a result of the many friends made to-day. The scores at 100 targets follow: Marshall 93, Heikes 89, Budd 89, Heer 96, Anthony 89.

NIBBS.

### Fitch Brook Gun Club.

LYNN, Mass., Feb. 22.—The forenoon was quite rainy, so that in consequence the attendance was small. On account of snow on the platform allowances were given as handicaps. On the shoot-off for prizes, 15 targets, the scores were: Frank 13, Straw 10, Kirkwood 13. Nos. 9, 10, 11 and 12 constituted the prize series. No. 13 contains the total, handicaps added:

Events:	1
---------	---

If you think yourself a good judge by the eye without measuring, make a guess of the width of that diamond-shaped cut in the Erie advertisement, from corner to corner. Then measure it and see how near you come to it.

### WHAT SHALL WE DO WITH HIM?

A CORRESPONDENT sends us this moving complaint and appeal: "I live in the town of Salina, bordering on the city of Syracuse. Game is very scarce here, and there is every reason for it to be so. I want a little advice. Every Sunday in the spring, summer, and fall, Italians flock into the surrounding country and shoot everything from a little wren to a crow or a sea gull. They are very fond of robins and meadowlarks. They even dynamite Lea Creek in the city limits. Is it possible to do anything to stop this?"

For relief from the Italian pot-hunter nuisance in this particular locality our correspondent should appeal, and not in vain, to the local State game protector. If that official does not take the matter in hand, communication should be had with the chief protector, J. Warren Pond, at Albany. For the suppression of the dynamiters, the Onondaga Anglers' Association, of Syracuse, would be, we are sure, glad to extend its co-operation. We advise application to these several parties, and shall look for a report of progress. What the individual cannot do, concerted action may accomplish. The foreign shooters were formerly rampant in the neighborhood of Orient, on Long Island. Last year the Orient Gun Club was organized with fifty members for the purpose of abating the nuisance of the Sunday fusillades of the Italians, and the effect of the movement is tersely summed up in the report: "Since the club's organization Sunday has been a quiet day, and song birds have had perfect freedom to enjoy life."

These depredations by Italians and other foreigners are just now engaging the attention of workers in the field of game protection very generally. In response to his recent paper on the depletion of bird life, President Alex. Starbuck, of the Cuvier Club, has received a communication from Chief Deputy Game and Fish Warden Charles E. Brewster, of Michigan, who declares it to be his conviction: "The source of the greatest danger to our song birds is, in my judgment, our foreign element. They come to this country imbued with the idea that here they will enjoy perfect and absolute freedom. To them a robin or a bluejay, a sparrow or meadowlark is of as large value as an article of food as a game bird of equal size. In this regard the Italians and Finns have proven especially destructive in our State."

As in New York and Michigan, so in Massachusetts, whose Commissioners of Fisheries and Game are seeking to secure from the Legislature now in session a search law to enable them the more effectively to cope with the foreign gunner plague. Several pages of the current annual report are devoted to the exposition of existing conditions as an argument of the desirability of such a search law. We quote these salient paragraphs:

To our minds there is no legislation for the protection of fish and game so much needed at the present time as a law which will give the right to search, with or without a warrant. There are many reasons why such a law should be enacted, the strongest of which, perhaps, is the pressing necessity of securing better protection for our insect-eating birds than is now possible.

The destruction of insectivorous birds is going on at a rate that threatens their extermination in the not distant future, or at least their serious decimation, to that degree that they can be of little practical value in checking the depredations of the numerous insect pests, prominent among which are the gypsy moth and the brown-tail moth.

For several years recently natives of southern European countries and Asia Minor have come to this State in large numbers. There is often a colony of them in the larger cities, and in cases where extensive industrial operations are being conducted in some of the country districts, as building railroads, reservoirs, etc., men of this class are often brought together; sometimes there are camps containing hundreds of them.

Wherever they are, these men generally develop a remarkable tendency to hunt when they can get away from their work—to hunt regardless of law, as a rule; and especially are they noted for killing insectivorous birds. It is true they sometimes catch small birds in traps, or by the use of bird lime, but the usual thing is for them to get possession of a cheap gun, some powder and shot, and then to go into the pastures and covers and shoot at anything that moves, although song and insectivorous birds are the special objects of their pursuit. It is not difficult to imagine the slaughter done by the groups who go out from the large cities, or by those who are temporarily assembled in the country towns; but it is a conservative estimate, that if this destruction goes on much longer, practically unrestricted, the effect upon the numbers of our small birds will be seriously evident.

Occasionally these men are caught in the act of shooting or trapping birds, and are brought into court, perhaps to be fined to the limit of the law if convicted, but more commonly with some other result. But, as the law now stands, one of these men may

have all his pockets stuffed with birds, and boldly walk by one authorized to enforce the law against shooting; and the latter, though he suspects the true condition, must stand helpless in the face of one of the most injurious and least excusable violations of the fish and game laws.

It will readily be seen that the chance of actually witnessing a violation of the law by shooting small birds is remote; and when there are so few active salaried deputies, little can be done to repress this illegal work until proper and necessary authority is given to the officers charged with the enforcement of law.

This description of conditions existing in Massachusetts will be recognized as a truthful picture of the small bird destroying Italian wherever he is herded together in temporary labor camps, or where he has opportunity to go abroad from city tenements for the ravaging of suburban fields. We have more than once found occasion to discuss these conditions as existing on Long Island on the east of New York city, on Staten Island to the south of Manhattan Island, in Westchester county on the north, and in New Jersey on the west.

Everywhere the foreign shooter is ubiquitous; and everywhere he is a problem which must be coped with.

What shall we do with him?

For one thing a search law such as they are discussing in Massachusetts would do something.

Something more would be done by a law absolutely forbidding the possession of firearms in the fields in the close season for game. Exception could be made in favor of landowners on their own property, and their guests, and persons holding their written permission. As the song bird killers hunt in spring and fall, the enforcement of a law forbidding the carrying of arms in close season would cut off a very large part of the shooting.

A third expedient—which has been adopted in Pennsylvania—is a law which classes the Italian with the non-resident sportsman, and requires him to take out a shooting license before he may carry a gun into the fields. The statute provides:

"Every non-resident and every unnaturalized, foreign-born resident of this Commonwealth shall be required to take out a license from the treasurer of the county in which he proposes to hunt before beginning to hunt in any part of this Commonwealth. Each and every person not a resident of this Commonwealth, and each and every person who is an unnaturalized, foreign-born resident of this Commonwealth, shall pay a license fee of ten dollars \* \* \* said certificate shall not be transferable, and shall be exposed for examination upon demand made by any game protector, constable, or game warden of the State. Sec. 2. Possession of a gun, in the fields or in the forests or on the waters of this Commonwealth, by an unnaturalized, foreign-born resident or a non-resident of this Commonwealth, without having first secured the license required by this act, shall be prima facie evidence of a violation of its provisions."

Any one of these plans, and any other that may be suggested, must depend for its full efficiency upon policing the fields by a larger force of game wardens than is now possessed by any one State. But even under existing conditions, and with the forces at hand, any one of them could be made a valuable factor in mitigating this foreign curse which the Almighty has brought upon America.

### THE PASSING OF THE KADIAK BEAR.

ABOUT twenty years ago America's greatest ungulate passed out of existence. If not the largest of mammals, it was at least one of the largest bearing horns and hoofs. Once stupendous in its numbers, and occupying a third of the continent, it then utterly disappeared.

The extinction of America's largest carnivore is immediately impending, and probably cannot be prevented. Not only is it the largest carnivore of America, but perhaps of the whole world—the giant Kadiak bear.

So far as known, this species is confined to the Island of Kadiak, in Alaska, where from time immemorial it has been hunted by the natives. As the country has been more and more fully occupied, and as the animals which furnish food and fur to the natives have grown constantly fewer in number, the pursuit of the Kadiak bear became constantly closer, so that a hunter visiting the island not long ago for the purpose of securing one of these bears has expressed the opinion that they were becoming very scarce. He spent eighty-seven days hunting before he secured the specimen he desired. Each

spring the hunters, whether Aleuts, Russians, or Americans, patrol the deep bays of the island looking over the snowclad hillsides in search of the tracks made by the bears when they first leave their dens, about the end of April. So complete is the natives' acquaintance with the habits of the bear, that when the tracks are found, the securing of the bear is almost a certainty.

Hunted in each valley which they must visit for subsistence, the bears are becoming constantly scarcer, wilder, and better able to take care of themselves, and at last they would have been killed down to a point where so few of them existed that their hunting would have been abandoned, and they would have had the opportunity partially to reestablish themselves. But a new element has come into the question of their existence. Last year a large number of sheep were introduced at a point on Kadiak Island. They had not been there long before the news of the new food supply spread among the bears of the neighborhood, and they gathered near the flock to feast upon them. The sheep herders endeavored to protect their charges, and the result was that about a dozen of these great bears were killed.

It is stated that this season more sheep are to be introduced at a number of points on Kadiak Island, and wherever they exist there the bears will gather to feast on the mutton. There, too, the shepherd will be present to protect the sheep, and the matter of getting all the bears that approach them will be one of very short time only. Thus this introduction of the domestic sheep on the Island of Kadiak will sound the death knell of this huge bear, and in a few years he will be known only by the few skins and skeletons that may exist in the museums.

Obviously no law can interfere to prevent men from protecting their property on Kadiak Island, and it is equally certain that no bear will shun a flock of sheep. Inevitably mutton will be preferred to the roots of the salmon berry, and even to the salmon which come up the stream, and before long Kadiak Island will be bereft of its bears.

No man again will see the sight once witnessed by an eminent ichthyologist, who, approaching Karluk Lake, cautiously raised his head above the brow of a hill and saw wandering about in the meadows bordering the lake twenty-five or thirty of these monstrous bears, each taller and much heavier than a full grown steer. Is it any wonder that the ichthyologist with equal caution lowered his head, and, turning his back on Karluk Lake and its surroundings, sped swiftly campward?

But for the coming of these sheep the attitude of the Alaska people toward the Kadiak bears might have been expressed in the liturgical salutation, "Peace to thee!" The intrusion of the wool interests has changed all that.

Consider the paradox of the situation. Bears are fond of mutton and wax fat on it. Sheep are defenseless, inoffensive creatures, and in the clutch of bruin absolutely helpless and passive. Considering the giant strength and rapacity of the one, the piteous weakness of the other, the introduction of sheep into a bear country might be considered the beginning of good things for the bears, the end of all things for the sheep. But the actual event is the very reverse. In the weakness of the sheep is the destruction of the bear. Human intervention means his doom. The Kadiak bear tragedy which is unfolding here in the remote corner of the Northwest is only in mimic stage setting the rehearsal of the world-wide tragedy which has been enacted since the time when man first turned sheep herder. As it is on the sheep ranges of Kadiak to-day, so was it in the vales of Bethlehem, where the shepherd son of Jesse defended his flocks:

"And David said unto Saul, Thy servant kept his father's sheep, and there came a lion, and a bear, and took a lamb out of the flock: and I went out after him, and smote him, and delivered it out of his mouth: and when he rose against me, I caught him by his beard and smote him, and slew him. Thy servant slew both the lion and the bear."

### III.—Alexander Henry.

(Continued.)

THE French Government had established regulations governing the fur trade in Canada, and in 1765, when Henry made his second expedition, some features of the old system were still preserved. No person was permitted to enter the countries lying northwest of Detroit unless furnished with a license, and military commanders had the privilege of granting to any individual the exclusive trade of particular districts.

At this time beaver were worth two shillings and sixpence per pound; otter skins, six shillings each; martens, one shilling and sixpence; all this in nominal Michilimackinac currency, although here fur was still the current coin. Henry loaded his four canoes with the value of ten thousand pounds' weight of good and merchantable beaver. For provision he purchased fifty bushels of corn, at ten pounds of beaver per bushel. He took into partnership Mr. Cadotte, and leaving Michilimackinac July 14, and Sault Sainte-Marie the 26th, he proceeded to his wintering ground at Chagouemig. On the 19th of August he reached the river Ontonagan, notable for its abundance of native copper, which the Indians used to manufacture into spoons and bracelets for themselves. This they did by the mere process of hammering it out. Not far beyond this river he met Indians, to whom he gave credit. "The prices were for a stroud blanket, ten beaver skins; for a white blanket, eight; a pound of powder, two; a pound of shot, or of ball, one; a gun, twenty; an ax of one pound weight, two; a knife, one." As the value of a skin was about one dollar, the prices to the Indians were fairly high.

Chagouemig, where Henry wintered, is now known as Chequamegon. It is in Wisconsin, a bay which partly divides Bayfield from Ashland county, and seems always to have been a great gathering place for Indians. There were now about fifty lodges here, making, with those who had followed Henry, about one hundred families. All were poor, their trade having been interfered with by the English invasion of Canada, and by Pontiac's war. Henry was obliged to distribute goods to them to the amount of three thousand beaver skins, and this done, the Indians separated to look for fur. Henry sent a clerk to Fond du Lac with two loaded canoes; Fond du Lac being, roughly, the site of the present city of Duluth. As soon as Henry was fairly settled, he built a house, and began to collect fish from the lake as food for the winter. Before long he had two thousand trout and whitefish, the former frequently weighing fifty pounds each, the latter from four to six. They were preserved by being hung up by the tail, and did not thaw during the winter. When the bay froze over, Henry amused himself by spearing trout, and sometimes caught a hundred in a day, each weighing, on an average, twenty pounds.

He had some difficulty with the first hunting party which brought furs. The men crowded into his house and demanded rum, and when he refused it, they threatened to take all he had. His men were frightened, and all abandoned him. He got hold of a gun, however, and on threatening to shoot the first who should lay hands on anything, the disturbance began to subside, and was presently at an end. He now buried the liquor that he had, and when the Indians were finally persuaded that he had none to give them, they went and came very peaceably, paying their debts, and purchasing goods.

The ice broke up in April, and by the middle of May the Indians began to come in with their furs, so that by the close of the spring Henry found himself with a hundred and fifty packs of beaver, weighing a hundred pounds each, besides twenty-five packs of otter and marten skins. These he took to Michilimackinac, accompanied by fifty canoes of Indians, who still had a hundred packs of beaver that they did not sell. It appears, therefore, that Henry's ten thousand pounds of beaver brought him fifty per cent. profit in beaver, besides the otter and the marten skins which he had.

On his way back he went up the Ontonagan River to see the celebrated mass of copper there, which he estimated to weigh no less than five tons. So pure was it that with an ax he chopped off a piece weighing a hundred pounds. This great mass of copper, which had been worked at for no one knows how long by Indians and by early explorers, lay there for eighty years after Henry saw it; and finally, in 1843, was removed to the Smithsonian Institution at Washington. It was then estimated to weigh between three and four tons, and the cost of transporting it to the national capital was about \$3,500.

The following winter was passed at Sault Sainte-Marie, and was rather an unhappy one, as the fishery failed, and there was great suffering from hunger. Canadians and Indians came in from the surrounding country, driven in by lack of food. Among the incidents of the winter was the arrival of a young man who had been guilty of cannibalism. He was killed by the Indians, not so much as punishment for the acts that he had committed, as from fear that he would kill and eat some of their children.

A journey to a neighboring bay resulted in no great catch of fish, and returning to the Sault, Henry started

for Michilimackinac. At the first encampment, an hour's fishing procured them seven trout, of from ten to twenty pounds' weight. A little later they met a camp of Indians who had fish, and shared with them; and the following day Henry killed a caribou, by which they camped, and on which they subsisted for two days.

The following winter Henry stopped at Michipicoten, on the north side of Lake Superior, and about a hundred and fifty miles from the Sault. Here there were a few people known as *Gens des Terres*, a tribe of Algonquians, living in middle Canada, and ranging from the Athabasca country east to Lake Temiscamingue. A few of them still live near the St. Maurice River, in the Province of Quebec. These people, though miserably poor, and occupying a country containing very few animals, had a high reputation for honesty and worth. Therefore Henry gave to every man credit for one hundred beaver skins, and to every woman, thirty—a very large credit.

There was some game in this country, a few caribou, and some hares and partridges. The hills were well wooded with sugar-maples, and from these, when spring came, Henry made sugar; and for a time this was their sole provision, each man consuming a pound a day, desiring no other food, and being visibly nourished by the sugar. Soon after this, wildfowl appeared in such abundance that subsistence for fifty men could without difficulty be shot daily by one; but this lasted only for a week, by which time the birds all departed. By the end of May all to whom Henry had advanced goods returned, and of the two thousand skins for which he had given them credit, not thirty remained unpaid. The small loss that he did suffer was occasioned by the death of one of the Indians, whose family brought all the skins of which he died possessed, and offered to contribute among themselves the balance.

The following winter was also to be passed at Michipicoten, and in the month of October, after all the Indians had received their goods and had gone away, Henry set out for the Sault on a visit. He took little provision, only a quart of corn for each person.

On the first night they camped on an island sacred to Nanibojou, one of the Chippewa gods, and failed to offer the tobacco, which an Indian would always have presented to the spirit. In the night a violent storm arose which continued for three days. When it abated on the third day they went to examine the net which they had set for fish, and found it gone. The wind was ahead to return to Michipicoten, and they steered for the Sault; but that night the wind shifted and blew a gale for nine days following. They soon began to starve, and though Henry hunted faithfully, he killed nothing more than two snow-birds. One of his men informed him that the other two had proposed to kill and eat a young woman, whom they were taking to the Sault, and when taxed with the proposition, these two men had the hardihood to acknowledge it. The next morning, Henry, still searching for food, found on a rock the *tripe de roche*, which is more or less well known as a lichen, which, when cooked, yields a jelly which will support life. The discovery of this food, on which they supported themselves thereafter, undoubtedly saved the life of the poor woman. When they embarked on the evening of the ninth day they were weak and miserable; but, luckily, the next morning, meeting two canoes of Indians, they received a gift of fish, and at once landed to feast on them.

In the spring of 1769, and for some years afterward, Henry turned his attention more or less to mines. He visited the Ile de Maurepas, said to contain shining rocks and stones of rare description, but was much disappointed in the island, which seemed commonplace enough. A year later Mr. Baxter, with whom Henry had formed a partnership for copper mining, returned, and during the following winter, at Sault Sainte-Marie, they built vessels for navigating the lakes. Henry had heard of an island in Lake Superior described as covered with a heavy yellow sand like gold dust, and guarded by enormous snakes. With Mr. Baxter he searched for this island and finally found it, but neither yellow sands, nor snakes, nor gold. Hawks there were in abundance, and one of them picked Henry's cap from his head. There were also caribou, and they killed thirteen, and found many complete and undisturbed skeletons. Continuing their investigations into the mines about the lakes, they found abundant copper ore; and some supposed to contain silver. But their final conclusion was that the cost of carrying the copper ore to Montreal must exceed its marketable value.

In June, 1775, Henry left Sault Sainte-Marie with four large canoes and twelve small ones, carrying goods and provisions to the value of three thousand pounds sterling. He passed west, over the Grand Portage, entered Lac à la Pluie, passed down to the Lake of the Woods, and finally reached Lake Winnipeg. Here there were Crees, variously known as Christinaux, Kinistinaux, Killistinaux, and Killistinaux. Lake Winnipeg is sometimes called the Lake of the Crees. These people were primitive. Almost entirely naked, the whole body was painted with red ochre; the head was wholly shaved, or the hair was plucked out, except a spot on the crown, where it grew long and was rolled and gathered into a tuft; the ears were pierced, and filled with bones of fishes and land animals. The women, on the other hand, had long hair,

which was gathered into a roll on either side of the head above the ear, and was covered with a piece of skin, painted or ornamented with beads of various colors. The traditions of the Cheyennes of to-day point back to precisely similar methods of dressing the hair of the women and of painting the men.

The Crees were friendly, and gave the traveler presents of wild rice and dried meat. He kept on along the lake, and soon joined Peter Pond, a well-known trader of early days. A little later, in early September, the two Fro-bishers and Mr. Patterson overtook them. On the 1st of October they reached the River de Bourbon, now known as the Saskatchewan, and proceeded up it, using the tow-line to overcome the Great Rapids. They passed on into Lake de Bourbon, now Cedar Lake, and by old Fort Bourbon, built by the Sieur de Vérendrye. At the mouth of the Pasquayah River they found a village of Swampy Crees, the chief of whom expressed his gratification at their coming, but remarked that, as it would be possible for him to kill them all when they returned, he expected them to be extremely liberal with their presents. He then specified what it was that he desired, namely, three casks of gunpowder, four bags of shot and ball, two bales of tobacco, three kegs of rum, and three guns, together with many smaller articles. Finally he declared that he was a peaceable man, and always tried to get along without quarrels. The traders were obliged to submit to being thus robbed, and passed on up the river to Cumberland House. Here they separated, Mr. Cadotte going on with four canoes to the Fort des Prairies, a name given then and later to many of the trading posts built on the prairie. This one is probably that Fort des Prairies which was situated just below the junction of the north and south forks of the Saskatchewan River, and was known as Fort Nippewen. Mr. Pond, with two canoes, went to Fort Dauphin, on Lake Dauphin, while the Messrs. Fro-bisher and Henry agreed to winter together on Beaver Lake. Here they found a good place for a post, and were soon well lodged. Fish were abundant, and the post soon assumed the appearance of a settlement. Owing to the lateness of the season, their canoes could not be buried in the ground, as was the common practice, and they were therefore placed on scaffolds. The fishing here was very successful, and moose were killed. The Indians brought in beaver and bear's meat, and some skins for sale.

In January, '76, Henry left the fort on Beaver Lake, attended by two men, and provided with dried meat, frozen fish, and cornmeal, to make an excursion over the plains, "or, as the French denominate them, the Prairies, or Meadows." There was snow on the ground, and the baggage was hauled by the men on sledges. The cold was bitter, but they were provided with "ox skins, which the traders call buffalo robes."

Beaver Lake was in the wooded country, and, indeed, all Henry's journeyings hitherto had been through a region that was timbered; but here, striking south and west, by way of Cumberland House, he says, "I was not far advanced before the country betrayed some approaches to the characteristic nakedness of the plains. The wood dwindled away, both in size and quantity, so that it was with difficulty we could collect sufficient for making a fire, and without fire we could not drink, for melted snow was our only resource, the ice on the river being too thick to be penetrated by the ax." Moreover, the weather was bitterly cold, and after a time provisions grew scanty. No game was seen and no trace of anything human. The men began to starve and to grow weak, but as tracks of elk and moose were seen, Henry cheered them up by telling them that they would certainly kill something before long.

"On the twentieth, the last remains of our provisions were expended; but I had taken the precaution to conceal a cake of chocolate in reserve for an occasion like that which was now arrived. Toward evening my men, after walking the whole day, began to lose their strength, but we nevertheless kept on our feet till it was late, and when we encamped I informed them of the treasure which was still in store. I desired them to fill the kettle with snow, and argued with them the while that the chocolate would keep us alive for five days at least, an interval in which we should surely meet with some Indian at the chase. Their spirits revived at the suggestion, and, the kettle being filled with two gallons of water, I put into it one square of the chocolate. The quantity was scarcely sufficient to alter the color of the water, but each of us drank half a gallon of the warm liquor, by which we were much refreshed, and in its enjoyment felt no more of the fatigues of the day. In the morning we allowed ourselves a similar repast, after finishing which we marched vigorously for six hours. But now the spirits of my companions again deserted them, and they declared that they neither would, nor could, proceed any further. For myself, they advised me to leave them, and accomplish the journey as I could; but for themselves, they said, that they must die soon, and might as well die where they were as anywhere else.

"While things were in this melancholy posture, I filled the kettle and boiled another square of chocolate. When prepared I prevailed upon my desponding companions to return to their warm beverage. On taking it they recovered inconceivably, and, after smoking a pipe, con-

sented to go forward. While their stomachs were comforted by the warm water they walked well, but as evening approached fatigue overcame them, and they relapsed into their former condition, and the chocolate being now almost entirely consumed, I began to fear that I must really abandon them, for I was able to endure more hardship than they, and, had it not been for keeping company with them, I could have advanced double the distance within the time which had been spent. To my great joy, however, the usual quantity of warm water revived them.

"For breakfast the next morning I put the last square of chocolate into the kettle, and, our meal finished, we began our march in but very indifferent spirits. We were surrounded by large herds of wolves which sometimes came close upon us, and who knew, as we were prone to think, the extremity in which we were, and marked us for their prey; but I carried a gun, and this was our protection. I fired several times, but unfortunately missed at each, for a morsel of wolf's flesh would have afforded us a banquet.

"Our misery, nevertheless, was still nearer its end than we imagined, and the event was such as to give one of the innumerable proofs that despair is not made for man. Before sunset we discovered on the ice some remains of the bones of an elk left there by the wolves. Having instantly gathered them, we encamped, and, filling our kettle, prepared ourselves a meal of strong and excellent soup. The greater part of the night was passed in boiling and regaling our booty, and early in the morning we felt ourselves strong enough to proceed.

"This day, the twenty-fifth, we found the borders of the plains reaching to the very banks of the river, which were two hundred feet above the level of the ice. Water marks presented themselves at twenty feet above the actual level.

"Want had lost his dominion over us. At noon we saw the horns of a red deer standing in the snow on the river. On examination we found that the whole carcass was with them, the animal having broke through the ice in the beginning of the winter in attempting to cross the river too early in the season, while his horns, fastening themselves in the ice, had prevented him from sinking. By cutting away the ice we were enabled to lay bare a part of the back and shoulders, and thus procure a stock of food amply sufficient for the rest of the journey. We accordingly encamped and employed our kettle to good purpose, forgot all our misfortunes, and prepared to walk with cheerfulness the twenty leagues which, as we reckoned, still lay between ourselves and Fort des Prairies.

"Though the deer must have been in this situation ever since the month of November, yet its flesh was perfectly good. Its horns alone were five foot high or more, and it will therefore not appear extraordinary that they should be seen above the snow.

"On the twenty-seventh, in the morning, we discovered the print of snowshoes, demonstrating that several persons had passed that way the day before. These were the first marks of other human feet than our own which we had seen since our leaving Cumberland House, and it was much to feel that we had fellow-creatures in the wide waste surrounding us. In the evening we reached the fort."

At Fort des Prairies Henry saw more provisions than he had ever before dreamed of. In one heap he saw fifty tons of buffalo meat, so fat that the men could hardly find meat lean enough to eat. Immediately south of this plains country, which he was on the edge of, was the land of the Osinipoilles, and, some of these people being at the fort, Henry determined to visit them at their village, and on the 5th of February set out to do so. The Indians whom they accompanied carried their baggage on dog travois. They used snowshoes and traveled swiftly, and at night camped in the shelter of a little bunch of wood. There were fourteen people in the tent in which Henry slept that night, but these were not enough to keep each other warm. They started each morning at daylight, and traveled as long as they could, and over snow that was often four feet deep. During the journey they saw buffalo, which Henry always calls wild oxen, but did not disturb them, as they had no time to do so, and no means of carrying the flesh if they had killed any. One night they met two young men who had come out to meet the party. They had not known that there were white men with it, and announced that they must return to advise the chief of this; but before they could start, a storm came up which prevented their departure. All that night and part of the next day the wind blew fiercely, with drifting snow. "In the morning we were alarmed by the approach of a herd of oxen, who came from the open ground to shelter themselves in the wood. Their numbers were so great that we dreaded lest they should fairly trample down the camp; nor could it have happened otherwise, but for the dogs, almost as numerous as they, who were able to keep them in check. The Indians killed several when close upon their tents, but neither the fire of the Indians nor the noise of the dogs could soon drive them away. Whatever were the terrors which filled the wood, they had no other escape from the terrors of the storm."

Two days later they reached the neighborhood of the camp, which was situated in a woody island. Messengers came to welcome them, and a guard armed with bows and spears, evidently the soldiers, to escort them to the home which had been assigned them. They were quartered in a comfortable skin lodge, seated on buffalo robes; women brought them water for washing, and presently a man invited them to a feast, himself showing them the way to the head chief's tent. The usual smoking, feasting, and speech-making followed.

These Osinipoilles seemed not before to have seen white men, for when walking about the camp, crowds of women and children followed them, very respectfully, but evidently devoured by insatiable curiosity. Water here was obtained by hanging a buffalo paunch kettle filled with snow in the smoke of the fire, and, as the snow melted, more and more was added, until the paunch was full of water. During their stay they never had occasion to cook in the lodge, being constantly invited to feasts. They had with them always the guard of soldiers, who were careful to allow no one to crowd upon or annoy the travelers. They had been here but a short time when the head chief

sent them word that he was going to hunt buffalo the next day, and asked them to be of the party.

"In the morning we went to the hunt accordingly. The chief was followed by about forty men and a great number of women. We proceeded to a small island [of timber] on the plain, at the distance of five miles from the village. On our way we saw large herds of oxen at feed, but the hunters forebore to molest them lest they should take the alarm.

"Arrived at the island, the women pitched a few tents, while the chief led his hunters to its southern end, where there was a pound or inclosure. The fence was about four feet high, and formed of strong stakes of birch wood, wattled with smaller branches of the same. The day was spent in making repairs, and by evening all was ready for the hunt.

At daylight several of the more expert hunters were sent to decoy the animals into the pound. They were dressed in ox skins, with the hair and horns. Their faces were covered, and their gestures so closely resembled those of the animals themselves that, had I not been in the secret, I should have been as much deceived as the oxen.

"At ten o'clock one of the hunters returned, bringing information of the herd. Immediately all the dogs were muzzled; and, this done, the whole crowd of men and women surrounded the outside of the pound. The herd, of which the extent was so great that I cannot pretend to estimate the numbers, was distant half a mile, advancing slowly, and frequently stopping to feed. The part played by the decoys was that of approaching them within hearing and then bellowing like themselves. On hearing the noise, the oxen did not fail to give it attention, and, whether from curiosity or sympathy, advanced to meet those from whom they proceeded. These, in the meantime, fell back deliberately toward the pound, always repeating the call whenever the oxen stopped. This was reiterated till the leaders of the herd had followed the decoys into the jaws of the pound, which, though wide asunder toward the plain, terminated, like a funnel, in a small aperture or gateway, and within this was the pound itself. The Indians remark that in all herds of animals there are chiefs, or leaders, by whom the motions of the rest are determined.

"The decoys now retired within the pound, and were followed by the oxen. But the former retired still further, withdrawing themselves at certain movable parts of the fence, while the latter were fallen upon by all the hunters, and presently wounded and killed by showers of arrows. Amid the uproar which ensued the oxen made several attempts to force the fence, but the Indians stopped them and drove them back by shaking skins before their eyes. Skins were also made use of to stop the entrance, being let down by strings as soon as the oxen were inside. The slaughter was prolonged till the evening, when the hunters returned to their tents. Next morning all the tongues were presented to the chief, to the number of seventy-two.

"The women brought the meat to the village on sledges drawn by dogs. The lumps on the shoulders and the hearts, as well as the tongues, were set apart for feasts, while the rest was consumed as ordinary food, or dried, for sale at the fort."

Henry has much to say about the Assinaboines, their methods of hunting, religion, marriage, healing, and many other customs. He notes especially their cruelty to their slaves, and says that the Assinaboines seldom married captive women.

On the 19th of February the Assinaboine camp started to the Fort des Prairies, and on the 28th camped at a little distance from it; but Henry and his companions went on, and reached the post that evening. Henry declares that "The Osinipoilles at this period had had no acquaintance with any foreign nation sufficient to affect their ancient and pristine habits. Like the other Indians they were cruel to their enemies; but, as far as the experience of myself and other Europeans authorizes me to speak, they were a harmless people with a large share of simplicity of manners and plain-dealing. They lived in fear of the Cristipaux, by whom they were not only frequently imposed upon, but pillaged, when the latter met their bands in smaller numbers than their own."

On the 22d of March Henry set out to return to Beaver Lake. They reached Cumberland House on the 5th of April, and Beaver Lake on the 9th. The lake was still covered with ice, and fish had grown scarce, so that it was necessary to keep fishing all the time in order to provide sustenance. Early in May, however, the water fowl made their appearance, and for some little time there was abundance. They left their post on the 21st of April very short of provisions. They traveled slowly, finally coming to a large lake, which, on the 6th of June, was still frozen over, but the ice was too weak to be crossed. The Indians killed some moose. On reaching Churchill River they set out for Lake Arabuthcow [Athabasca] with six Canadians and an Indian woman as guide. The river was sometimes broad and slow-flowing, and again narrow and very rapid. Fish were plenty. On January 24 they reached Isle à la Crosse Lake, and met a number of Indians, to whom they made presents, and whom they invited to visit them at their fort. These Indians seem to have been Chipewyans, known to ethnologists as Athabascans. They accepted the white men's invitation, and all started for the fort, continuing the journey day and night, stopping only to boil the kettle.

The discipline among these Athabasca Indians seemed exceedingly good, as, in fact, it usually was in primitive times. The orders given by the chief were conscientiously obeyed, and this under circumstances of much temptation, since, when liquor was being served out to the young men, a certain number were told off who were ordered not to drink at all, but to maintain a constant guard over the white men.

In the trade which followed, the Indians delivered their skins at a small window in the fort made for that purpose, asking at the same time for the different articles they wished to purchase, of which the prices had been previously settled with the chiefs. The trade lasted for more than two days, and amounted to 12,000 beaver skins, besides large numbers of otter and marten skins. These Indians had come from Lake Arabuthcow, at which they had wintered. They reported that at the farther end of that lake was a river called Peace River, which descended

from the Stony or Rocky Mountains, from which mountains the distance to the Salt Lake, meaning the Pacific Ocean, was not great. Other things the Indians told Henry which he did not understand, but a few years later Alexander McKenzie was to meet these questions and to solve many of them. These Indians dressed in beaver skins, and were orderly and unoffending. Mr. Joseph Frobisher and Henry now set out to return to the Grand Portage, leaving the remainder of their merchandise in the care of Thomas Frobisher, who was to go with them to Lake Athabasca.

When Henry reached the Lake of the Woods he found there some Indians, who told him that a strange nation had entered Montreal, taken Quebec, killed all the English, and would certainly be at the Grand Portage before they reached there. Henry remarked to his companion that he suspected the Bastonais had been up to some mischief in Canada, and the Indians at once exclaimed, "Yes, that's the name, Bastonais."

Without further accident Henry reached the Grand Portage, from which place he continued to Montreal, which he reached the 15th of October. Here he found that the Americans had been driven out, and that the city was protected by the forces of General Burgoyne. The capture of Montreal took place in the fall of 1775, and Quebec was besieged during the winter of 1775-'76, and it was nearly a year later that Henry heard the news at the Lake of the Woods.

This ends the account of Henry's travels, but he was still in the fur trade for many years later. In 1785 he was a leading merchant of Montreal, and in 1790 he returned to Michilimaekinae.

His book was published in New York in 1807, and thus not until six years after the publication of Alexander Mackenzie's great work. Henry died in Montreal, April 4, 1824, in the 85th year of his age.

Besides himself being a fur trader, Henry was a father of fur traders. His son, William Henry, is constantly mentioned in the diary of Alexander Henry, the younger. A second son, Alexander, was also in the fur trade, and was killed on the Liard River. Alexander Henry, the younger, the nephew, is well known, and will be very fully noticed hereafter. A Mr. Bethune, constantly spoken of by Alexander Henry, Jr., may, or may not, have been a relative. Certain it is that Alexander Henry had nephews named Bethune.

The account from which we have so freely quoted is remarkable for its simplicity and clearness of style, as well as for the keen powers of observation shown by the writer. It is one of the most interesting of the many interesting volumes on the fur trade of its own and later times.

GEO. BIRD GRINNELL.

## Two for Grover.

It was early in November, 1892. For many months during the close season our guns had lain in innocuous desuetude. The law, the absence of game, and a blistering sun vetoed indulgence in any sort of field sports. But the long summer was now over, the northerners had begun to blow, bringing cooler days and crisp nights, and with them the hosts of water fowl for their winter sojourn in the warm South. The red gods called us and we must go duck shooting. Ah! but the election, now only a few days off, and the candidates coming down the homestretch under whip and spur! We must stay to see the finish.

It was a condition and not a theory that confronted us. A political crisis was at hand, and if our favorites for Justice of the Peace, Constable, Coroner, and other important public functions failed of election, republican institutions would be imperiled. Clearly, we could not go until after the election; but, in the meantime, we could put in a lot of lieks getting ready.

A comfortable sloop was chartered and brought around to a convenient wharf, and on Election Day drayloads of guns, ammunition, dogs, tents, bedding, cooking utensils, eatables, drinkables, and all sorts of unthinkables were carried on board. The results of the election—National, State and local—were decisive, and by midnight it was all over but the shouting.

Long before daylight, with copies of the first newspapers off the press, we tumbled into our bunks, exhausted by the labor and excitement of the day. There were a few words of command, a tramping about the deck, a rattling of blocks, and the little vessel was slipping away through the darkness, while we, down below, were sleeping the sleep of the just, the tired, and the victorious.

When we awoke for breakfast, the sun was high in the sky, and we were half way to the shooting grounds. A very jolly party it was, too, all except one colored gentleman, who declared dismally that his party "couldn't carry no States." As we discussed the breakfast we fought the political battle over again, and agreed among ourselves that it was now a mere matter of form to go down to Washington and get a "nice fat office or some other comfortable thing," and we determined then and there to turn out into the cold, unfeeling world every one of those obtrusive Republicans who had butted in, and for four years usurped our places at the public crib. For, while we were all in accord with our leader that "public office is a public trust," we were unanimously of the opinion that it was also a "private snap."

A pleasant sail ended in good season, and we took our places in the blinds for the evening flight. Straggling into camp at nightfall we found dinner ready, but—"Where's the Boss?"

"Hasn't got in from the lake yet. Pitch in, he'll be along presently."

Our Warwick soon appeared, sneaking in from the back of the camp, evidently anxious not to attract attention.

"What's he got?"

"Nothing but a pair of spoonbills."

"Whew! He's low gun."

"Won't do a thing to him."

The Boss sat down in silence.

"Say, did you hear that bombardment down by the outlet this evening?"

"Sure. Never heard such a bangin' since Farragut ran the forts."

"Whose stand was that?"

## Natural History.

### No Over-Production in this Line.

It was early in April; cinquefoil, dandelions, violets, and Mayapples were starring the ground, while overhead dogwoods were masses of white blooms, buds on tulip poplars fast taking shape, and, in certain sheltered localities, buckeyes were giving promise of a scarlet future through April and May.

I had taken a wide circuit, searched carefully for my gnat-catcher friend, and given it up with the remark, "He's not here, that's sure," and lo! as I scrambled down the steep hillside where by and by pawpaws and Hercules' clubs will be overrun by a wealth of wild vines, a turn in the path disclosed two little blue-grays flitting about among the bare trees with as much at home an air as though a month—nay, possibly no more than a week—since they had not been reveling in orange groves away across the great gulf.

The male, the bluest of his kind, was singing his best, the lady listening approvingly and politely, it was clear, for she never changed position without saying, "Excuse me, my dear, but there is a gnat I must have." Satisfied now with the day's "arrivals," I left the ravine, and on consulting my record found this, which had seemed late, compared favorably with dates for "firsts" in former years.

Something like a week passed, and the bulk of their species had gone further north, leaving, however, numerous pairs to rear families in this part of Arkansas, and among them my April 4 friends.

They chose the end of a branch on a great maple that hangs over the drive at the cemetery, and by the 11th had begun to clasp bits of bark and other mossy stuff about it. Not in a helter-skelter manner, you may be sure, but with the nicest discrimination as to materials, and the workmanship of veterans in the business. Every tiny scrap was placed where the structure needed rounding out, and when fastened to their liking, off they would go for another installment.

Not a stone's throw away, there was a cross-vine that had climbed the chevaux-de-frise trunk of a honey locust, and while awaiting the return of the architects from their oft-repeated trips after supplies, the at first undefined interest in some half-opened buds on this single representative of the Bignonia family that blooms here, settled into a conviction that it, too, was watching the nest, and the day it was completed would hang out some full blown trumpets. Of course it may have been only a coincidence, but the very day the finishing touches were given to the dainty cup-covered outside with flower-like bits of lichen, and felted inside with spider's webs, which the little lady had pressed into shape with her soft breast, three gorgeous yellow-red blossoms swung gaily out toward the maple. Anxiety lest unfriendly eyes discover this cradle of hope had been lessening as the leaves grew larger, and now it was so nearly hidden, immunity from harm seemed sure.

Alas for such assurance! The third morning after the celebration, the little couple had completely disappeared, and nothing remained of the nest save its foundation. Whatever the reason for its destruction, the doer of the deed took from the world's stock of beauty and good cheer a portion that can never be replaced.

About the same time a peach tree at our porch door had been chosen as the prospective birthplace of a family of chipping sparrows. The nest was well hidden, and madame was just ready to reap the reward for her patience, when something evil transpired here, too, that left only the frayed and dilapidated beginnings of a home. No one could tell how it happened, and, worse still, none knew how to prevent a recurrence of the same tragic ending of high hopes, should the pair decide to rebuild in the tree.

Not far from the peach stands a young maple, whose branches were so laden with leaves that fear for the safety of its slender stem during a violent spring storm led its owner to cut some of the heaviest away. To the first that fell was, unhappily, suspended the beautifully constructed nest of an orchard oriole. The hope that such homes would be made in our trees had been at last realized, and this was the end. With the patient labor of days the marvelously artistic home had been made, and there it lay on the ground with its three tiny eggs still unbroken, but not all our love for the poor little things, nor knowledge of bird ways, would enable us to make up for the wrong done them, nor the pleasure and profit a family of that kind would have been to the neighborhood.

Knowing that birds love mulberries simplifies migration studies somewhat, and this year, because the crop was abundant just here, and less so possibly elsewhere, copious notes were made by keeping close to some one of a *Morus rubra* family that stands in my "north ravine." Interest in the coming and going of resident birds never flags, though of constant recurrence, all through the ripe berry season; but when, on a bright morning in early May, a number of Wilson thrushes and four scarlet tanagers were found in their company, something more than the usual pleasurable emotions were mine. Familiar with both in their summer haunts, only once heretofore had this branch of the tanager family been represented at my station, and that a single visitor for a day. Now they remained a full week, and not only was their peculiar "chip-chirr-r-r" often repeated, but spring song rehearsals were overheard on two or three occasions. It was while waiting expectantly for one of these that a nest of a wood thrush, with Madame at home, was discovered. The location was so favorable for study that I resolved to know all there was to be learned about raising thrush families, and paid daily visits to her tree. Ten consecutive mornings she was snug in the nest, and the gentleman often heard singing—as only a wood thrush can—then she was absent; and hours of watching thereafter proved the house was abandoned. What had caused its desertion at that most interesting of all moments could not be known, for the limb upon which it was resting swung just out of reach of the handle of my umbrella, and no other means of bringing it down were at hand. All to be said for a certainty is that a home had been carefully built, a little creature full of life and fond of freedom had remained perfectly quiet for days, and now, when she was to be

"Believe the Boss had some decoys out down there."  
"That accounts for it. Couldn't kill anything with that old piece of gas pipe."

"Reckon his dog might ketch a cripple or two."  
"He needs practice. I'll take him out behind the camp in the morning and throw up some bottles for him."  
"He's been throwing up too many bottles already—sees 'em double."

"Say, Mistah Cook, throw them spoonbills out, they'll spile our bags. Don't want any trash ducks in this camp."

Everybody took a shot at the Boss, but he "chawed" on, apparently unruffled, being too good a sportsman to get rattled, and too much of a philosopher to lose his temper. Finally, as the fire slackened, he surveyed the party calmly, and drawled out: "You gentlemen seem to be having a lot of fun, and I'm not disposed to interrupt your merriment; but the plain fact is, I haven't been duck shooting at all this evening. I have just been celebrating the election of Grover Cleveland."

The explanation was ample. The Boss was vindicated, and we all joined in singing "Grover, Grover, four years more of Grover," a very popular air in the South in those days.

Four months later we had all gathered again at the old camp for the final shoot of the season. Spring was coming on apace, and the birds were taking through tickets by the air line for the Hudson Bay country. The evening flight was over, and the Reformer was low gun, coming in with only a single redhead. We determined to give him a bad quarter of an hour, but we never touched him. When he had taken all that was coming to him, and was serenely full of the good things of the table, he laid down his knife and fork and complacently inquired: "Were you gentlemen speaking of duck shooting, or do I mistake? Pardon me if I appear absent-minded tonight; I am absorbed, so to speak, in contemplation of that great historical event."

"What's he drivin' at?"

"He's goin' to lie out of it somehow."

He resumed pensively: "I hope you had good sport. I have not been duck shooting myself. I have spent the evening in celebrating, in a proper way, this great anniversary."

"Holy Moses! What are you givin' us? This ain't no anniversary."

"I am surprised at your ignorance of the history of our Republic. This is Grover Cleveland's birthday—Caldwell, New Jersey, March 18, 1837. Allow me, gentlemen, to propose his health, wishing him many happy returns of the day."

They couldn't down the Reformer, and "you'd orto heerd 'em yell" as they borrowed the toast of his friend Rip, and drank to the health of the stout Jerseyman, hoping that he might "live long and prosper."

NOAH DRAKE.

TEXAS, 1904.

### The Camp-Fire Club.

THE Camp-Fire Club's last dinner of the season was held on Saturday evening, March 6, at the Aldine Association rooms, 111 Fifth avenue.

The guests of the evening were Mr. John Burroughs and Edward L. Thorndike, of Columbia University.

The evening was divided into three parts by the chairman, President William T. Hornaday. The first part was devoted to a very good dinner; the second part to the consideration of the intelligence of animals; the third part to an experience meeting among the members.

In his introduction of Messrs. Burroughs and Thorndike, President Hornaday criticised many of the theories advanced by the Rev. Wm. J. Long, who had addressed the Camp-Fire Club at the February dinner.

Mr. Thorndike told of his residence of eighteen months in a Harlem flat with three monkeys, during which time he had discovered the monkey to have a higher degree of intelligence than any other animal. His experiments with cats and dogs and chickens had furnished him with much interesting data connected with this subject.

Mr. John Burroughs was peculiarly and delightfully interesting. Declaring he had come to the camp-fire to talk with its members and not to them; he did, however, talk to them. As has already been shown in print, Mr. Burroughs has very little sympathy for the advanced ideas of Mr. Long. He said that he believed he had spent as many days in the woods as Mr. Long, from the fact that he was many years older, and that in these many years it had been his misfortune not to have the creatures of the woods perform their miracles in his presence as they had for Mr. Long, citing as an instance the woodcock packing mud on its broken leg, and then standing on one foot for an hour exposing the plastered member to the sun until it became hardened.

Mr. E. H. Fitch, assisted by Geo. Linklater, a well-known Canadian guide, gave a very instructive exhibition of the value of the tump line as a means of transporting heavy loads through the Canadian wilderness. This line consists of a heavy wide soft strip that fits across the forehead and is attached by either end to the heavy packs in such a fashion that the burden falls on the back just above the hips. When thus loaded a man, by poising the body well forward, may almost entirely relieve the strain on his neck. To illustrate the nature of this packing device, Mr. Fitch placed four hundred pounds on the back of Mr. Linklater, and he walked around among the diners with perfect ease; nor was there discoverable on Mr. Linklater's forehead a mark of any kind from contact with the strap.

The other speakers were Mr. Henry Walsh, who told a story of parrot life in British Honduras; Mr. L. F. Brown entertained the members in a most delightful way, speaking in a happy vein of some of his many interesting fishing and camping experiences, and ending by repeating a parody poem on Edgar Allen Poe's Raven. Mr. A. A. Anderson told many interesting things of the United States Teton forest reserve. Mr. Ernest Thompson Seton spoke on the intelligence of the wolf family, showing how contact with human beings had brought out a newer intelligence, if not a higher. He instanced the ease with which wolves were once poisoned and trapped, and the difficulty in doing it now.

repaid for it all, the hand of a greedy egg-collector, or the beak of a hungry enemy in feathers, had stolen the tiny cells, broken them open, and murdered the angelic musicians imprisoned within. Of the fate of the mother thrush I was not sure, but that no other nest was built in the neighborhood there remains not the shadow of doubt.

Some time before a neighbor telephoned, "What do you think! A redbird has a nest in that magnolia at the end of our gallery, and the lady was the more composed of the two when I parted the branches and surprised her this morning." Eggs were reported, and then came days of quiet for the bird and anxiety for my friend, followed at length by this message: "I'm in despair! Not a vestige of the nest we have guarded so jealously is left, and the poor little couple look so disappointed and forlorn that they make me perfectly miserable. What about our bird law? Oh, yes, I know it's hopeless, for I haven't the least idea whom to accuse. Wish I did, I'd go over to Little Rock this minute and enter complaint before Judge Trieber, for he says the birds belong to the State, and if to the State, then whoever took that nest from my very door took my personal property, and they should be punished accordingly."

After the middle of June we were in the Traverse Bay land, where scarlet tanagers, Wilson and hermit thrushes are as common as pewees, vireos, juncos, and song sparrows; where purple finches, white-throated sparrows, and even rare winter wrens are to be heard singing; and robins and house wrens build in our porches. But here, as elsewhere, the kinds of misfortune are so numerous, and so impossible to guard against, that if, for some unexplainable reason, first broods did not fare better than later ones, the supply of tenants for our beautiful woods would soon be exhausted.

A little house had been put up in the porch before leaving the previous year, and a family of wrens left it the day we arrived. House-cleaning was begun almost immediately by the brown lady, then new sticks were carried in, the husband singing blithely meanwhile, whether from the spruce which enabled him to oversee the worker, or on his frequent trips after food for his ever-hungry babies. Silence on the part of the singer for a whole day made us fear a tragedy had occurred, and it required no investigation to decide the cause when the poor housewife's body was found with a grub too large to be swallowed, and too hairy to be ejected, once she had made the attempt. Examining the nest, five as sure promises for the early appearance of "the season's best vocalists" as ever were given by trustworthy impressario, were found snuggled amidst twigs and tiny rootlets, but of course the widower could not be expected to raise two families alone, so the house was "to let" the rest of the season.

Where the carriage drive joins our avenue stood an unoccupied cottage that was, on account of some events transpiring just under its roof, an object of interest to many. In a snug corner, a robin built her nest, and as long as the curiosity of her neighbors remained passive, all went well. However, a day came when it became aggressively active on someone's part, for on Madame R's return from a flying visit to some near-by service berries, the shells of the three eggs left in the nest lay on the sidewalk below. Happily such treatment did not prevent her from going over into the underbrush skirting the bluff to repeat her housekeeping experiment, and here, where a tall dead pine gave Mr. R. unobstructed view of all about him, it is hoped marauders were overtaken before harm was done.

The other event came through Mrs. Jennie's deciding the deserted nest to be as good a place to rear wren babies as they were likely to find so late in the year. It required some argument to induce Mr. Jennie to consent to the venture, but at length he was persuaded and enough furniture to change a robin's house into one suitable for their tiny progeny was moved in, and they settled down to the business in hand. We saw them come and go often, heard his song always, and in good time five little wobbly heads were seen in the nest. Numberless skirmishes with Billy, the chipmunk, and the more to be dreaded squirrels were undertaken in their behalf, and with success, it appeared, for in an incredibly short time they had outgrown their quarters and left us altogether. Report from an eye witness said the journey into raspberry land was safely accomplished, and that now forays for food were being made with the upturned roots of a tree as a starting point, and we were content.

Days before the robins were driven from the corner, the nest of a chestnut-sided warbler and another I was proud to identify as a black-throated blue warbler's, were discovered and daily visits paid until the young ones in the first were three days old and the other pair had three eggs. One who knew birds, but not that family, begged to go with me that morning, and I had just finished assuring her they must not be expected—though real warbler babies—to look very different from the ugliest sparrow at that time of life, as we tiptoed up to the nests. There they were, one in a tangle of blackberry vines, the other in a very small fir tree, both empty, and not a trace of their owners to be found anywhere.

We were talking of these accidents with a friend late in the summer, and were sorry to know results were the same in her field, though brought about by different causes. In some of her stories boys were to blame; in others, the squirrels and cats, but the ill that discouraged most—because impossible to prevent—was the drowning of whole broods of chickadees and chipping sparrows during cold rains in June. And this peculiarly unfortunate weather condition was found by later reports to have been general and serious enough to affect many families of birds.

In Bird Lore for September-October, Mr. Lord, of Rockland, Mass., told of the alarming death rate among martins and barn swallows from cold and starvation; Mr. Hales, of Ridgewood, N. J., of the almost entire absence of barn swallows in a neighborhood that had boasted numbers of families heretofore; Mrs. Horton, of Vermont, described the drowning and starving of a colony of martins and a family of black-and-white warblers; Mr. Jacobs, of Pennsylvania, gave a detailed account of the ills that befell his many families of martins; and on another page Mr. Brewster pictured the terrible havoc made at some bank swallows' nests by an entirely different agent—a mink.

Of course it is not denied that the birds whose nests were destroyed as related very probably rebuilt, nor that the martins and swallows may thrive and increase next year, but that the chances for a repetition of the same tragedies are just as probable can also not be denied, and it is because "we are," as Mr. Brewster says, "so nearly powerless to foresee and prevent such tragedies" that attention has been drawn to them with such particularity.

Given so many evils we cannot control, what shall be done about some not of that class? Make stringent laws and see they are enforced. The key to the future lies in the hands of the children, and they are not likely to sympathize very deeply with "the poor little birds," however poetically persuaded, so long as their mothers wear whole bodies or even their breasts. Assurances of their being made from feathers of domestic fowls may satisfy their wearers, but even with the milliner's certificate attached, the distinction is too fine for the average boy or girl. They are simply dead birds to them, and the habit of regarding them legitimate spoil, whether killed for sport, for food, or to ornament the gentler sex, has become too firmly fixed for anything to cure, save the making and enforcing of prohibitive laws, and unless we do this, next year's production will fall short of this in an ever-increasing ratio as time goes on until nothing remains.

MRS. L. MCG. STEPHENSON.

HELENA, Ark.

## The Starling.

JERSEY CITY, Feb. 21.—*Editor Forest and Stream:* In answer to Robt. T. Morris, in *FOREST AND STREAM* of February 13, as to how starlings feed during winter, I will say from personal observation that large numbers of these birds can be seen almost any day feeding along the Hackensack meadows on a seed called "blue bens." This plant is very common on the meadows, in some places covering many acres of ground, growing to a height of three feet, and hanging heavy with seed.

It not only serves as food for the starlings, but all small birds that remain on the meadows during winter feed on it, and a friend of mine tells me he killed a black duck during the very high water of late last fall, and found him to be full of this same seed. I inclose some which I gathered to-day, and would be pleased to have you state whether "blue bens" is the right name or not.

A few years ago blackbirds were very common on the meadows, and to-day they are anything but common, and in their places we see large flocks of starlings. What has become of the vast numbers of blackbirds? I do not see half as many to-day as I did a few years ago. Has our friend the starling anything to do with it?

W. H. KEIM.

[Some of the British bird books say that in Scotland, where in winter the frost and snow cover up most sources of food supply, the starlings feed on the sea beach, sand, rocks, and mud flats uncovered at low tide. They have been observed feeding on the mud flats of the Harlem River, below Highbridge, New York, this winter. The grass sent by Mr. Keim is the tall smooth panic grass (*Panicum virgatum*, L.), one of the millet grasses which grows quite commonly over the whole Atlantic Coast, and spreads widely toward the west. The panic grasses are an important group of food grasses which afford fodder and grain food to many animals and birds. The blackbirds, about which our correspondent inquires, have grown scarce in many localities where once they were abundant. These birds do enormous damage to the rice crops of the South, and are there destroyed in great numbers. At the same time we have seen at various places in the South in winter vast flocks of these birds.]

NEW YORK, March 2.—*Editor Forest and Stream:* The flock of starlings in Lawrence Park is apparently being broken up by the fancy that comes when a livelier iris changes on the burnished dove, and the males are in full song. They may be seen and heard at almost any time of day. The starling will probably rival the fox sparrow as an early songster, and it is interesting to note the early mating, after a winter so severe that all ordinary food supply has been out of reach for weeks at a time.

ROBERT T. MORRIS.

SOUTH ORANGE, N. J., Feb. 22.—*Editor Forest and Stream:* In last week's number of *FOREST AND STREAM* I notice that your correspondent mentions the fact that starlings are increasing the area of their range in his locality. In the immediate vicinity of South Orange, N. J., I had never observed them previous to a couple of months ago, when a flock of some forty or fifty individuals suddenly appeared in town and remained during the cold weather. At first the birds were rather wild, and it was only with some difficulty that I secured one for purposes of identification; but during the coldest days, and especially after a snowfall, they became quite familiar, spending their time either perched in the apple trees, or picking away at the ivy which grew on the house, while at night a number roosted behind the shutters on the third story. Crumbs and grain they persistently refused at all times, but they cleared my ivy of berries, and pecked at every frozen apple in the orchard.

It is now some years since starlings were first introduced into this country, and it would be interesting to learn from other sources just how far these familiar European birds have extended the area of their range. From all reports they are increasing rapidly, and it is not improbable that within a decade at least they will have become well established in many localities.

It is always interesting to watch the progress of a foreign species which has been introduced into a new environment. Let us hope that the little stranger will not develop any of those qualities which sometimes prove introduction a disastrous failure. Australia suffers from the ravages of the rabbit. The mongoose is the greatest calamity which ever befell Jamaica; and to-day there is hardly a village in the United States which does not suffer the tyranny of that diminutive rascal, the English sparrow.

WM. ARTHUR BABSON.

PRINCE'S BAY, N. Y.—*Editor Forest and Stream:* Mr. Robert T. Morris asks about what English starlings

had to eat this winter. In a recent number of *FOREST AND STREAM* he will see where I referred to their eating frozen apples on the trees in my yard. Of course that is only one article, but it shows they are fond of such a diet when snow has covered the ground. \*\*\*

## Winter Visitors from the North Pole.

DURING the summer of '80, I was sent by the head of a big lumber concern to take charge of a small mill they had completed at St. Jerome, a French settlement lying thirty miles to the north of Montreal. This mill was situated a mile from the village, and, to be near it, I found quarters with an old English settler whose farm adjoined our place. Summer passed, and fall merged into winter, which proved a severe one. Snow fell in such quantities as to about obliterate the wooden fences lining the country roads, the top posts alone showing. The mill hands all departed for the logging camp, and I had little to do beyond looking after the company's property. With the snowstorms, which were of frequent occurrence, great flocks of snowbirds (*Plectrophenax nivalis*) made their appearance from their Arctic home.

It was fun to watch them revel amid the feathery flakes, flying, like the blackbirds, in large numbers, generally against the north wind, and alighting to feed on the seed pods of the tallest weeds which stood in patches through the desolate fields, their heads alone showing above the white mantle that covered them. As fast as the first birds would alight, those coming behind, flying over their heads, pitched down a little in advance of them until they had all settled, when the leaders, who were now the hindmost, repeated the operation. In this manner those hardy little fellows all found food. They were graceful, easy fliers, and some of them were ever in sight, hovering over the wintry landscape.

Farms there were a half mile apart, and our nearest neighbor's two boys had, by setting snares near their homes, captured a pair of these birds which I noticed on passing their house one day. These I determined to obtain. A little silver did the business. They were male and female, beautifully colored in brown, yellow, and white, the last predominating. I secured a roomy cage for the pair, and hung it in the kitchen of the farmhouse, near a double window. The captives were exceedingly wild, and seemed to dislike the air of this warm room, so the cage was placed outside on the porch in a spot sheltered from the wind. Here they thrived much better, and in a few days I heard the male singing a low sweet warble to his mate. While they became used to my daily presence, and grew much tamer, yet I noticed they seemed to miss something, though their home was plentifully supplied with seed and water. I flattered myself that I understood birds and their wants in captivity pretty thoroughly, having had many varieties for the purpose of studying their ways from my boyhood up; but here I was evidently at fault. I racked my brain for the cause, and only found it by accident.

One day, when standing near, a bit of snow from the eaves fell within reach of the female on the cage. She eagerly devoured it, and looked about for more. The male seemed equally interested, so, taking the hint, I placed a generous lump inside the cage. The two fell upon it as though famished, eating a piece as big as a small apple in a few minutes. I had perceived that they cared little for their water cups, which were hardly disturbed during the day, and here was the solution of the problem that troubled me. Nature had ordained that these birds should forever dwell in a region where the water is always in a congealed state, but at the same time given them the power to eat snow with impunity.

Daily after that discovery they were supplied with it, and it seemed to me that the male now sang louder than before. As the wild flocks, at the first sign of spring's approach, began to disappear, my pets became uneasy, so on one March morning, noticing a small number of their species taking an early breakfast in a pasture opposite the porch, I opened the cage door to its widest extent, and the now happy pair, finding it out, flew joyfully over to join the others. A week later not a snowbird was about.

## A Wild Cat and Railroad Rail.

NOTICING the account of the hundreds of jack rabbits that became frozen to the surface of the ice when they were trying to cross a pond, and which were mowed down and gathered up, we are moved to report a similar occurrence.

One morning last month a section hand on the Greenbrier Railway was coming to his work before daylight, and came upon a wildcat or red lynx which seemed to be fast in a trap. He attacked the animal with stones and a club and killed it.

Upon investigation it was found that the wildcat had swum the Greenbrier River and had one of its feet frozen to the iron rail of the railway, which was about thirty-five feet from the edge of the water.

The thermometer was six degrees below zero that morning.

The wildcat was killed about four miles from where I live, and the report caused a good deal of discussion as to whether it was worthy of belief.

I was inclined to give the story full faith and credence, and in this I was supported by many of those who are used to finding many strange things happening in the woods.

If this story was presented to a jury, I fear that learned opposing counsel would try to laugh it down, but there is much that could be urged in support of it.

In arguing the evidence it could have been shown that the killer, a negro man, left home unarmed, and appeared at the section house a mile away with a freshly killed wildcat. The tracks of the cat proved conclusively where it was killed. If the cat had not been in some sort of a trap, the man could not have approached it. There is no animal so rarely seen in the woods as a wildcat.

The tracks showed that it had come out of the river, and had not crossed the track.

The wildcat is a good swimmer, and takes to the water

readily. Instances could be quoted where the wildcat has swum the distance of two miles.

Again, when the wildcat in its peregrinations arrived at the railroad track and was about to cross it, it would have noticed the open right of way and would have been intent to see whether any person was in sight, and would have taken a careful observation. In doing this, it is the nature of the beast to plant its fore foot on some elevated spot and listen and look intently for some moments. He rears on a log generally, but in this instance the rail was the highest point available, and therefore it planted its foot on the cold iron, and so met its fate.

Then, too, it might be urged that all members of the cat kind are very easily taken when trapped by the foot. One of the largest panthers ever taken in this section was trapped in a small steel trap such as boys use to take muskrats. The trapper was trapping for raccoon, and was rewarded by a large panther. The wildcat can be held by the weakest of traps when the foot is compressed.

On the whole, I think the story is true. I submitted the case to Harvey Cromer, a timber scout for a large land company, and one of the best woodsmen I ever saw, and he, after going into the matter, was inclined to believe it.

All of which is respectfully submitted.

ANDREW PRICE.

MARTINTON, W. Va.

## Bears in Dens.

*Editor Forest and Stream:*

I see in your last issue that in Mr. Grinnell's story of Alexander Henry, he mentions Henry's killing a female bear in the den in January, and that they found the fat "six inches deep" in several places, and that, "the Indians remark that the bear comes out in the spring with the same fat which he carried in in the autumn." This exactly agrees with my experience with bears taken in the den, and is exactly contrary to what scientists say, and what the majority of people believe. Scientists assert that the bear lives in winter on his accumulated fat, and comes out poor in the spring. It has been my fortune to handle a good many bears taken from the den at all times in winter from early in December to, in one case, the very last day of March. I can now remember fifteen large bears which I have examined, and the most of which I skinned, all, without exception, were fat—some of them as fat as any I ever saw. One which was nursing two cubs, taken the very last day of March, was in good flesh.

The cubs are born in January, and at first are not much larger than gray squirrels. I have known of cubs evidently several days old to be taken the 8th day of January, although I think more are born later in the month. I have seen one with three yearling cubs, but never saw one with yearlings have any lately born. I think that many bears do not breed every year.

Henry speaks of "female bears always making their winter lodging in the upper parts of trees." With us this is different. I can recall four cases where female bears with cubs were either under roots or in hollow logs.

Many people think that bears sleep all the time in winter. While no one can prove that they do not sleep some, I know surely that the bear is a great part of the time. I have known of instances where bears had backed into hollow logs and their eyes were seen open; but the most conclusive evidence is a case where Henry Clapps, of Brewerville, Maine, kept two bears two winters. They were denned in his haymow, and he told me that he looked at them nearly every time he fed his cattle, and that they always had their eyes open.

M. HARDY.

## The Coming of the Change.

SAYRE, Pa., March 5.—There are visible and exhilarating indications of spring. The buds of the soft maple are swelling, the tag alders are growing uneasy, and the pussy willows are perceptibly responding to the mysterious influence of nature's awakening. Wild geese have been seen repeatedly railroading northward during the past fortnight, while bluebirds and robins are everywhere in evidence. In the memory of the present generation no winter has equalled the one just closing in severity. Reports from local covers are to the effect that ruffed grouse have withstood the winter in excellent condition, but the quail have in some sections suffered terribly, and many beaves are said to be sadly depleted. It is hoped, however, that the birds will emerge from the long existing Arctic condition in better condition than reports would now appear to warrant.

Fishing tackle is beginning to steal into the store windows, and anglers are here and there unlimbering their wading boots in anticipation of the trout season.

M. CHILL.

## A Complete Mastodon.

THE newspapers report the discovery, on a creek near Dawson, Yukon Territory, of a complete mastodon. The beast was covered with thirty feet of ice and gravel, and appears to be absolutely complete. It is stated that the skin and hair are perfectly preserved, but that the flesh is decomposed—two things that do not seem to go together. The value of the complete skeleton is placed at \$50,000; it may possibly be worth one-fifth of that sum.

## Deer Driven in by Hunger.

ALTOONA, March 2.—The unprecedented severe weather of the present winter is driving the non-hibernating animals from the mountains to the settlements in this section. Martin McCartney, a farmer living in the Allegheny foothills, west of the city, saw a herd of six deer in one of his fields, almost starved and digging dried grass from beneath the snow.—Erie (Pa.) Dispatch.

# GAME BAG AND GUN

## After Jacksnipe with Peon Guides.

ON THE SANTE FE TRAIN IN KANSAS, Feb. 23.—*Editor Forest and Stream:* According to a promise made you several years ago, to the effect that whenever I indulge in any sport, a chronicle of which would interest your readers, I am to send you, if time permit, a description thereof for your paper. I now write to inform you that I am just about concluding a combined business and pleasure trip of six weeks' duration in the Republic of Mexico. On this trip I have broken all my previous records in both wildfowl shooting and tarpon fishing, so perhaps your readers may be interested in learning about the sport.

In this letter I shall confine my attention to the shooting, leaving for a future communication some notes on tarpon fishing and tarpon tackle that I would like you to publish.

My fishing experience was shared by my good friends, Messrs. F. S. Eaton and H. G. Pickering, of Boston; and Mr. Pickering has promised to send *FOREST AND STREAM*, soon after his return to the United States next April, a record of our doings at and near Tampico during the first half of the present month. Desiring not to anticipate any portion of his story, I shall reserve what I have to say about tarpon fishing until after his letter to you is published.

On Jan. 8, I left Kansas City for the Republic of Mexico, professedly for the purpose of making an inspection of all the bridges and openings on the entire line of the Vera Cruz & Pacific Ry., which is now nearing completion, and examining a proposed river crossing for a newly projected road, and incidentally for the purpose of taking my semi-annual vacation in a manner most pleasing to my taste. As my business appointment at Orizaba was arranged for the 20th, I was able to stop en route for five or six days' shooting at an old stamping ground of mine in Central Mexico, where apparently a large portion of the brant, ducks, and jacksnipe of the United States and Canada spend the winter months in company with other wildfowl of a more sedentary nature, which breed and live entirely in Mexico.

I took with me from Kansas City 800 loaded shells, Nos. 4, 6, 8, and 9—not that these were sufficient for my needs, but that they were all I could carry in addition to my other hand baggage. Just here let me digress a little to remark that the sportsman in transporting his shells by railroad is in rather hard luck. The railroad companies, if they know it, will not let them go as baggage; and the Pullman Company will not allow them in their cars. Again, if sent in advance by either freight or express, there is no telling when they will arrive at their destination, especially if they have to pass a custom house. Ordinarily, the Pullman conductors and porters ask no impertinent questions concerning the contents of one's hand baggage, so on previous occasions I have managed to carry my cartridges with me in the sleeping car; but on this trip an officious passenger remarked to the porter that, "the heat of the steam pipes might explode those shells," consequently he had to refuse to allow them in the car, and I was compelled to hand them over to the baggage-man, and subsidize him to look after them in an ex-officio capacity. Those cartridges were more trouble to me than a hunting dog would have been; for, not only did I have to interview and tip each new baggage-man on the entire route, but in addition I had quite a time getting them through the Mexican Customs. However, "all's well that ends well," for I got the shells finally to their destination, saving on them over \$1 per hundred, as compared with shells bought in the City of Mexico. Besides, the latter cannot always be relied upon, while my cartridges were first class, being loaded with Lafin & Rand's Infalible powder; a smokeless powder that I have found will withstand the deteriorating effect of the damp climate on the coast of the Gulf of Mexico.

On the forenoon of the 12th, I reached my destination, and was met by one of my old and valued guides, who had everything in readiness for an early start on horseback to the shooting grounds, which we reached by 1 o'clock. These grounds, which I had shot over with great success two years previously, are simply ideal for jacksnipe; but they are not good for duck shooting—although alive with ducks—because of the lack of cover for hiding. They consist of a strip of marshland some two miles long, by about half a mile wide, most of which is covered with water not over knee deep, forming a small grass-grown lake in the middle, and leaving a boggy circumference about 100 yards wide. It is in the latter that the jacksnipe feed; and they certainly were there in great numbers and fairly tame—for a while at least.

Leaving our horses in the swamp to feed, and my spare gun and other impedimenta on the embankment of an irrigating ditch, I put on my rubber boots, loaded both the guide and myself with a good supply of shells, and proceeded to get down to business. Much to my satisfaction, I soon found that, in spite of being out of practice, I had not lost my old-time knack of bringing down my favorite game bird. At first I certainly made some inexcusable misses, but as we pro-

ceeded around the marsh the guide's hunting coat pockets began to bulge out, notwithstanding the fact that ere long I had emptied them of shells. His load was augmented by three unfortunate ducks that had not figured with sufficient accuracy on the range of my little Smith gun, and its ability to throw No. 9 shot.

After making something more than a half circuit of the lake, I saw that I was going to run short of shells, so we cut across and worked toward our cache. Sure enough, before getting there the last shell was fired, and for a while the snipe flew away unmolested.

Upon my arrival at the cache I was very glad to rest. The day was hot and the sky cloudless; and, although the walking was as good as anyone could ask for in a snipe ground, having had no hard exercise for several months, I was taken with the most severe attack of cramps in the legs that I have had in the field. In half an hour, though, they eased up sufficiently to enable me to start on another circuit of the same ground with a fresh supply of shells. The snipe appeared to be just as plentiful as before, and in spite of the cramps, which had not entirely left me, I shot about as well as ever.

After having made a half circuit of the lake, we were joined by several peons on horseback, who appeared to be quite interested in the sport. To them it seemed odd that anyone would care to shoot birds worth only three or four cents (Mexican) apiece with cartridges costing ten or eleven cents (Mexican) each, so they made a suggestion to the effect that if I would wade out to the middle of the lake and stoop down, they would go to the far end, form a line, and drive the ducks toward me.

Being pretty badly tuckered out by this time with the walking, I agreed and proceeded to the middle of the lake; but, alas! when I tried to stoop, the cramps caught me again with renewed vigor, and I had to remain erect. The peons, though, did their part, and drove the ducks in great numbers down the lake toward me. Of course, seeing me erect, they all swerved and made the shooting rather long range for my light, open gun; nevertheless, inside of two minutes I had fired ten to twelve shots and had knocked down seven birds.

This ended my shooting for the day; for I made a virtue of a necessity by leaving the marsh full of game two hours before sunset, with plenty of shells in our pockets.

On counting the bag we found seventy-three jacksnipe, ten ducks and a hawk, the latter having had the temerity to make three dashes for a crippled snipe that was running only a few paces in advance of the guide. By his special request I treated the audacious bird to a dose of nines. These eighty-four birds were killed in less than three hours with an expenditure of 149 cartridges; and not a single bird brought down was lost. This last circumstance was due to the extraordinary energy and vigilance of my guide, who is able to mark as many as half a dozen snipe, before proceeding to retrieve them, and to find them all. It is true that I aided him occasionally by picking up a bird or two when he was chasing cripples; but almost all the birds were retrieved by him.

At 4:30 P. M., my peon escort left, well contented with a dollar "*para beber*," then we mounted our horses and started for the hotel.

Before proceeding further with this story, I must in justice to myself and in order to avoid, if possible, being considered by your readers a "game hog," explain that my gun had not been out of its case for thirteen months, that probably a full year would elapse before my next shooting trip; that I have a number of friends in Mexico City who appreciate the game I send them; and that my outing was limited to about five days' sport. On this account, I did not, as in the past when shooting in this district, put a limit on the size of the bag, but shot either as long as the shells held out or until physical exhaustion called halt. Not a single bird of my five days' bag was wasted, all being sent to friends in the city, excepting those used in the hotel and by my guides.

As long as I live, I shall remember clearly the night that succeeded this first day's shoot; for the cramps returned worse than ever; the fleas bit and perambulated over me in spite of the insect powder with which I had sprinkled the sheets, and I could not close an eye the whole night. Worse than all these discomforts, though, was a thought that I could not dismiss from my mind, viz.: that I had gotten too old for wildfowl shooting—my fiftieth birthday was then due in three days—and that already I might have had my last good jacksnipe shoot. However, I turned out at daylight and prepared once more for the field. This time we reached the marsh at 10 o'clock, and although I was still very sore in the muscles, I found that the cramps had departed to return no more for that outing.

The sound of the shooting soon brought my friends, the peons, in augmented numbers. Of their own accord they lined up some ten paces or more behind me, and extended over most of the snipe ground between the lake and the irrigating ditch. In this manner we swept the entire field driving the snipe before us, most of the birds coming within range of my gun, and flying either directly ahead or across from right to left. I

must have "had on my shooting jacket" that day, for but few of the birds fired at escaped. At times there were half a dozen dead birds on the ground at once. I never attempted to retrieve any of them, leaving that to the guide and my cortège. And how those fellows did enjoy the sport! Every time a bird fell a laugh went down the whole line; and when I would miss a bird with the right barrel and bring it down at fifty or sixty yards with the left (which is slightly choked) they actually yelled! Never before had I seen such shooting, never before had I shot in better form, and never before had I taken such pleasure in bringing down birds! The fun I gave those fellows was to me the best feature of the sport. They had never seen anything like it before—and for that matter neither had I. Occasionally, in spite of all the commotion, a duck returning to the marsh would come within range and get bagged, and once I killed a curlew at over sixty yards—probably a chance shot, as I was then using eights.

It did not take long for my gun to get too hot to hold, then I put a glove on my left hand and proceeded. Two hours of this business were all that I could stand, so at noon we adjourned for lunch and rested till 2 o'clock, when we resumed operations. By this time the snipe and I had become acquainted, so they endeavored with some success to keep out of the way, many of them rising out of range. At 4 o'clock I had had enough, so we returned to where we had left the horses, and proceeded to count the bag, which footed up to 103 jacksnipe, six ducks, and one curlew. In addition to these I had knocked down eight other birds which had not been retrieved (mostly ducks that fell in the tules across the irrigating ditch); and the expenditure of shells was 182.

Before parting with our escort we arranged with them for the use of a boat, tow horse, and rider for the next day in order to reach the haunts of the brant, far out from the shores of an almost impassable marsh.

For this sport I took along my guide's brother, who is himself a hunter and guide, at least two men being necessary to retrieve the brant. He had guided for me previously, consequently I knew his worth.

In my time I have hunted game of various kinds and have fished in many lands, but never in all my experience have I found guides to equal these two brothers. They are certainly true sportsmen (even if they do shoot sometimes for the market). More hard-working, willing and agreeable fellows I have never known! The amount of physical exertion they put forth on occasions is truly a revelation to those acquainted with the usual slothful Mexican nature. They are powerfully built men, between thirty and forty years of age, and about five feet ten inches in height. Such hands as they have! powerful, but well shaped, and their bodies are in proportion. Concerning the latter I speak advisedly, for several times in my service have they stripped off every rag, and for hours retrieved dead and crippled brant and ducks in water sometimes over their heads! Early and late they will labor for me without the slightest sign of grumbling, and they never permit me to do any of the work of which they can relieve me. They always give me the choice horse to ride, and very seldom allow me to carry any of the load, excepting when the weight of the game is too great for their horses, then they put a small portion of it upon mine.

It is not everybody, though, that they will exert themselves for like this; and I know that there are some sportsmen for whom they refuse to work at all. The reason for this is that I am fond of them and they are fond of me.

My hunting and fishing guides are nearly always my friends. Occasionally I run across a disagreeable one; but soon get rid of him pleasantly, and never engage him again. My guides all say that I work them harder than do any of their other patrons; nevertheless, they will nearly always go with me in preference to anyone else. This is probably due to the fact that it is both my custom and my nature to treat a guide not as a hired man, but as a companion and fellow sportsman. A guide who works for the dollars only, is not worth having. Unless he truly enjoys his share of the sport, he is not worthy to be a sportsman's guide.

These two Mexicans of mine are themselves sportsmen to the core. When I miss a shot it really disappoints them more than it does me. I wish, though, that I could speak in the same strain of the Mexicans who row me for tarpon fishing; but, unfortunately, they are of a different breed. It is the dollars that they are interested in, and not the sport. Some of them, however, that I am training, begin to show some interest in handling and securing the fish. But enough of dissertation, so let us return to the narrative.

By starting the next morning at 5:30, and riding about nine miles, we reached at 7 o'clock the place on the edge of the marsh which had been designated for meeting our man with the horse and boat. The latter only was there, so we had to send back for our motor, thus losing some time.

How well I remember my first experience, three years ago, with this method of boat propulsion! Rosalio had made all arrangements the day before for a boat to meet us at a certain place and hour, but when

we got there no boat was to be seen; and, moreover, I did not see how it could reach us, as there appeared to be no water—nothing but a mass of green weeds forming a solid looking mat with a small island of firm ground a quarter of a mile away, containing a hut of the most primitive type of construction.

When I asked Rosalio where the boat was he replied, "It will be here presently," and very soon pointing with his finger he remarked, "It is coming," and sure enough it was; for I saw approaching us a horse with an absolutely naked rider, and having a boat tied to his tail. At first the animal was immersed only to his knees, but presently down he went into a hole with little more than his ears above water. And how the rider did urge the poor brute till he reached a more substantial footing. When I had realized the situation and had grasped the idea of the method of propulsion, I laughed till I had to lie down. It was the funniest sight I had ever beheld. At the same time I pitied the poor devil of a horse, condemned to such labor. And how he did detest it! At every deep spot he stopped and refused to budge; but his relentless rider kept urging him on, so in he had to go and scramble through. It took me quite a while to become accustomed to such a method of travel, for I could neither conquer my tendency to laugh, nor cease pitying the poor brute.

On this morning, though, it was all an old story. Rosalio and I loaded the boat with the paraphernalia, stepped in, and pushed off from the shore, then the motor was attached in the customary manner, and we set forth, Savas (Rosalio's brother) following on foot in a state of nature, having placed his clothes in the boat.

After three-quarters of an hour's ride, we reached a very small island on which was an old blind that I proceeded to take possession of, Rosalio taking the boat and propelling it with a pole through the comparatively open reaches of water, in order to stir up the brant. The location did not prove satisfactory, for after I had knocked down seven brant they all deserted that end of the swamp; but the duck flight which ensued was great. Seeing that there was to be no more brant shooting, I began on the ducks and soon brought down some twenty-five or thirty. Unfortunately, the surrounding swamp was in many places impassable, consequently the guides succeeded in retrieving only six brant and eight ducks. Had either of them been with me when I shot the ducks, we would have bagged more; but I failed to locate them properly.

At 11 o'clock we took lunch and then proceeded further into the interior of the marsh, perhaps as much as two miles, choosing a place for the boat, with comparatively clear surroundings for the retrieving of fallen birds. We partially covered the boat with swamp grass, and thus made a fairly good blind. It was not as effective as it might have been, for the brant seldom came within sixty yards, so nearly all the shooting had to be done at very long range. This day I used an old Lefevre gun of my brother's that is a killer; but it has no ejector, as has my Smith gun. Early in the day I had exhausted my limited supply of fours and had to fall back on sixes. With the latter I managed to score pretty well; but toward 4 o'clock it was necessary to begin using eights; and these were too light, although with them I managed to bag four or five brant.

At 4:30 we quit shooting and started for the shore, reaching there a few minutes before 6, consequently, by the time the horses were loaded it was quite dark. Our bag consisted of thirty-five brant and ten ducks. Besides these, I must have killed seven or eight brant and at least twenty ducks that were not retrieved. This day I failed to keep count of the cartridges expended; but, considering all the conditions, the shooting was not bad.

Next day Rosalio and I procured permission to shoot over some ground where my son, Leonard, and I two years before had found excellent sport, and took a ride of twelve miles and a walk of two or three more to reach it, only to find that the conditions had changed, and that there were no birds there. After picking up six straggling jacksnipe, we returned to the hotel tired and disgusted—my birthday, too, and I had counted on such fine sport to celebrate it; so I had to confine my celebration to opening a bottle of champagne and inviting the old landlady and her pretty daughter to share it with me.

Next morning we returned to the snipe marsh, but found the birds comparatively scarce and rather wild. In two rounds of the lake we picked up thirty-eight snipe and a dozen ducks, then Rosalio advised me to wait an hour for the evening flight of ducks, which he said would come to the marsh from the westward; and, sure enough, it did! I had no blind, so lay on some low, dry ground near a ditch and shot until my gun got hot, dropping a dozen, then moving further south some 200 yards and dropping twice as many more; then the shells gave out, so I had to quit and start back to town. All this duck shooting was done with No. 8 shot. The bag this day amounted to thirty-eight jacksnipe and forty ducks, but we failed to retrieve a number of ducks that fell at long distance.

I had taken the precaution several days before to wire a friend in Mexico City, asking him to send me 300 more shells, 100 being for brant; and these came to hand that night.

The next day (Sunday), which was to be the last day of my outing, was devoted entirely to brant shooting. All arrangements had been made for a 9 o'clock start in the boat; and we were there ahead of time, but the man with the horse did not put in an appearance. We lost an hour in finding another man, most of the inhabitants of the district having gone to town to enjoy the fiesta that was being held there. After obtaining a man, the next thing was to obtain a horse. Certainly there were plenty of them near by, but Rosalio informed me that only a very few had been trained or boat towing. These few apparently knew for what they were wanted, and struggled hard to escape from the half dozen lassos that were in pursuit of them, loubing and twisting with great skill and malice. I could not blame the brutes for their unwillingness to serve, and in a way I sympathized with them and re-

joiced when they dodged the rope, although my day's sport was being materially shortened by the delay.

After the loss of nearly another hour a trained horse was secured and hitched to the boat, and a little before 11 o'clock we started for the place where we had spent the previous afternoon, arriving there about noon.

We had brought with us some canes, cut into lengths of about six feet, and an ample supply of strong cord and old tarpon line for building a blind. This we constructed by driving the stakes firmly into the bottom all around the boat, swaying them with the cord to masses of weeds at all four corners, running another cord so as to connect continuously the tops of all the stakes, and hanging from this bunches of long swamp grass. A half hour's work made a good blind; but, unfortunately, it was too good—at least the brant thought so later on, as they dodged it almost without exception. A less elaborate construction would have served the purpose better. The insecure one we used the other day was much more effective.

Although the brant were as plentiful as ever, the flight did not begin until quite late in the afternoon, but occasionally a few birds would come within long range. At first I thought I was going to make a killing because I bagged three with the first four shots; but I soon failed to keep up such a record. All the shooting was from sixty to eighty yards; and the cartridges bought in Mexico City did not seem to have the force of those I had brought from home. Of the latter there remained only two boxes, and these were sixes, but they seemed to do better execution than the Mexican fours.

At about 4:30 the real flight began, and soon the bottom of the boat was strewn thickly with empty shells. By reason of the weak powder and the long range, and perhaps because I was somewhat rattled, the misses became more and more numerous. Occasionally a bird would fall dead near by in good shape; but often a cripple, or even a dead bird, would drop a quarter of a mile away. Perhaps I did not lead enough to allow for the very long range and the comparatively weak shells, or I may have simply shot badly. Be this as it may, when the approaching sunset called a halt, I found I had expended one hundred 4s, fifty 6s, and a portion of a box of 8s, while we were able to recover only thirty birds. We must have left, though, fully ten dead birds besides a lot of cripples that distance and lack of daylight prevented our searching for. Both guides worked well and hard, and even the motor-man picked up a bird occasionally. Although the bag was smaller than it ought to have been, the saddle horses found it quite large enough on the home journey, as the thirty birds weighed fully 180 pounds.

Thus ended one of the most successful wildfowl shoots of my life. In practically four days' shooting (for on the 12th and the 17th I shot only in the afternoon, and the 15th resulted almost in a water-haul) I bagged 65 brant, 67 ducks, 220 jacksnipe, and several other birds, about 360 in all.

Next forenoon I spent in cleaning the guns, packing my belongings, and preparing to start for the Isthmus of Tehuantepec to attend to professional duties, and incidentally to put in nine days of as hard work and disagreeable traveling as have fallen to my lot in many years.

J. A. S. WADDELL.

## The Folly of Bear Protection.

Editor Forest and Stream:

The statements Mr. George L. Brown makes about Adirondack bears in your issue of February 27, where he mentions how few bears are ever shot, agree with the state of things in Maine. Very few bears are ever shot by fair shooting in Maine, except in summer and early fall, when they are picking berries and the skins are worthless. I have certainly bought the skins of more than five thousand well furred bears, and I do not believe that fifty were shot, unless in traps or when taken from dens, unless one counts small cubs shot when the mother was in a trap. And the larger part of those shot were killed almost by accident by men hunting other game.

There has been some movement here about protecting bears in order to furnish sport for visiting hunters. The man who indulges in the fancy that he can go into the woods in Maine and shoot bears, unless he should have dogs trained to the business, will be wiser after he tries it. A bear is far harder to hunt than a deer or moose, and if a man should kill one in hunting ten falls he would be more fortunate than most men I ever knew. It seems strange that when it can be proved beyond a doubt that bears not only kill a great many calf moose, but also old bulls when in their full strength, anyone can be found who cares anything for the protection of large game who would propose to protect bears. While bears eat a great variety of food, they also destroy a large amount of large game—moose, caribou, and deer. The reason more deer are not charged to the account of bears, is that they can do with a deer as they do with a sheep—drag or carry it off to some secluded spot and eat it, and after they have done with it, so little remains that if ever found no one can prove it was done by bears. I have followed where a bear dragged a large buck a long way to find a place which suited him to eat it in. I have known one to carry off a deer which a hunter had shot, while the man had gone for help to get it to camp, and leave so little trace of it that it was never found. In this case he probably carried it in his arms, walking on his hind legs, as I have had one carry a heavy clog to a trap.

I do not blame Mr. Brown for protesting against bears being protected. If the Game Commissioners wish to protect the large game in any State where a bear is found, they should put a bounty on bears. If they do not care for the farmer's sheep, they ought, at least, to help protect the game.

BREWER, Me.

ELIZABETHTOWN, N. Y., Feb. 29.—*Editor Forest and Stream:* Ransacker wrote for fun in the FOREST AND STREAM of February 20, 1904, about our bears. However, I couldn't be humorous if I would, and wouldn't if I could, when writing upon a subject of so much consequence to those immediately concerned—i. e., the people residing in Essex county. Here in Essex county black

bears still exist in numbers sufficient to supply local needs and a little to spare without State aid. The fact that 36 bears, on an average, have been killed in Essex county during the past quarter of a century is pretty good evidence that bruin has been here in the recent past, and in large numbers, too. That his work of destruction continues is evidenced by the sheep killing and pig stealing which continues unabated. Less than a year ago two men drove up to my office with three cub bears, two of which I bought (a male and a female) for John E. Milholland for his ranch—Meadowmount Farms—in the town of Lewis, the next town north of Elizabethtown. I paid only \$15 apiece for the cubs. The cubs were worth \$10 apiece bounty, so it will readily be seen that the men who had captured the cubs over in the town of Jay didn't value them much beyond the bounty. The person who implies residence by the sundown sea needn't have any fears about the black bears of the Adirondacks running out, as they (the bears) are not only holding their own, but everybody else's. Our sheep are worth \$5 apiece during July, August, and September, and if we didn't raise sheep here, what would Ransacker's bears feed upon? Three generations of Essex county people have toiled unceasingly to hew this country out, to bring it up to its present state of civilization. We who have borne the burden and heat of the day do not propose to be run over with bears, have our sheep, pigs, cattle and horses, our crops and fruit trees totally destroyed just for the sake of giving bruin entertainment. The consensus of opinion here seems to be that bruin is a beast of prey, and that he should be shot on sight any time between January 1 and December 31, both inclusive.

GEORGE L. BROWN,  
Editor and Manager Post and Gazette.

## New York Spring Shooting.

MUCH interest is being taken by sportsmen generally over the Hubbs bill (Assembly 85), introduced in the New York Legislature to repeal the law forbidding the shooting of ducks and geese in the spring of the year. Many gunners on Long Island, as well as a smaller number in central New York, are anxious that this prohibition should be removed and that the State should repeal the bill passed last year, and should restore the permission to shoot in the State.

Letters written on paper on which is printed in large letters, "Association for the Protection and Preservation of Wild Ducks" are being sent in all directions, with view to arousing an influence in favor of the Hubbs bill, but no one knows who constitutes this association, for its members and officers do not appear willing to have their names known, and the only information evident about the society is the signature to the letters, "W. E. Hookway, Secretary." A. Mr. A. H. Hollenbeck, referred to in the Syracuse paper as "A prominent duck hunter of this city," is quoted as making a carefully prepared argument in favor of a change in the existing laws, but his argument is disconnected and lacks logic. Mr. Hollenbeck acknowledges the necessity of protection for wild game, but declares that in the case of wild water fowl comparatively few come to New York State, and that therefore this State is not at all responsible for their welfare, when compared with States where they congregate in vastly greater numbers. He declares that if protection is to be applied to water fowl, it should be in the States where they are numerous, and not here where a small number of ducks, and those mostly of an inferior quality, furnish recreation for a large number of busy men. He then—without any definite purpose—goes on to enumerate different places in the United States where ducks are abundant. He acknowledges that some species breed here, but, declaring that many others do not, says that it is a blunder to protect these last. If the report given of this argument is correct, it shows that its author has very little idea of close reasoning.

On the other hand, the Audubon Society of New York has put forward a strong plea for the retention of the existing law, which was published in FOREST AND STREAM last week. The Boone and Crockett Club, at a meeting held last week, expressed its views in no uncertain terms by a letter sent to the chairman of the Fish and Game Committee of the State Senate, which reads as follows: *Hon. Elon R. Brown, chairman, Senate Chamber, Albany, N. Y.:* Dear Sir—It is an accepted principle of game protection that all wild creatures should be protected during their mating and breeding season, and this has been generally recognized by the Legislatures of all the Provinces of Canada, of several of the New England States, and many of the Western States, which have adopted laws forbidding the spring shooting of wildfowl.

The destruction of wildfowl over our whole country, which in the South is going on for eight or nine months of the year, is far greater than the annual increase, and from economic motives alone it is highly desirable to shorten the period during which they may be killed.

Recognizing these principles, the Boone and Crockett Club recently adopted the following resolution:

*Resolved,* That the Boone and Crockett Club condemns Assembly Bill No. 85, introduced by Mr. Hubbs, repealing the prohibition of spring shooting, and earnestly advocates the retention on our statute books of the law prohibiting the shooting of all wildfowl in the spring of the year.

Yours truly,

MADISON GRANT, Secretary.

The general feeling seems to be strong that the law as it stands on the statute book should remain in force.

It is hardly to be imagined that the Legislature will repeal the existing law, and it is hoped that nothing will be done, unless it should be to amend the present law by making the prohibition against spring shooting absolute, and so removing the permission to shoot brant.

Major Powell Cotton, who recently returned from a trip in Uganda, reports that there are, on the upper Nile, special cemeteries for elephants, which the natives are not allowed to enter. In one of them he saw hundreds of bleaching skeletons.

*All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.*

### Arefar's 18-Pound Trout.

DURING the early summer of 1902 I had the pleasure of meeting your correspondent Arefar, and a friendship was formed between us which I treasure most highly, and which I trust will always endure.

After being accorded the privilege of looking over the doctor's fly-books, rods, reels, etc., which for safe keeping and protection against the dry California climate were carefully stored in his cellar, he showed me a 10½-pound rainbow trout preserved in a large jar occupying a place of honor in his office. He had taken that beauty with an 8-ounce rod and on a No. 1 royal coachman fly in Crystal Creek, Pelican, Oregon. To look at this fish was a treat, as I had never seen a true trout of that size. The doctor then told me of a close fishing co-partnership which for the past twenty years had existed between his "pard Jimmy" and himself. During that period they had never missed spending their month's vacation at either Echo Lake, Cal., or Pelican Bay, Ore.

During my frequent visits to his office, the Doctor, with set purpose, would recount some of his experiences; sometimes he would be engaged in trying the six-foot leaders—which he made from carefully selected Spanish gut—in preparation for his departure for Oregon on his annual vacation with Jimmy. Each day as I left his office the Doctor would say, "Better come along, son." I stood the pressure as long as I could, but at last, driven to the verge of insanity, one morning I told the Doctor that I was with him.

Having but a few days in which to make my preparations, I secured a list from him and started for "Frisco to rig out." The Doctor's parting words were: "Be sure it is good and strong; don't bring cheap tackle to Pelican." I was fortunate in securing a great bargain an 8-ounce Bchabara rod in addition to my other tackle, so that I felt prepared for any emergency.

Three days later I arrived in Ashland, and the next evening, after a fifty-mile stage drive, landed at Pelican Loop, the Doctor and Jimmy having arrived two days before. They reported the fishing as only fair; but when I saw on the grass a dozen fish taken that day that would run from two to eight pounds, I determined that if during my ten days' stay hard work would do it, I should kill a few of the big boys or die in the attempt. Hansen being the only available boatman, was engaged by the partners from year to year, but the Doctor was kind enough to send him out with me the following morning, in order to give me some idea as to the fishing grounds. There being absolutely no ripple on the bay, I was told that I could not expect the fish to rise; but every few seconds the boat would disturb one of the monsters, which, with a swish of his tail, showed as he dashed away his resentment at being disturbed in his siesta. Hansen kept saying, "Don't get excited, there are lots of them."

There is an unwritten law among the legitimate anglers who fish from the lodge that no fish under two pounds shall be kept, unless too badly hooked. The following morning I went out alone and during a "ripple" which lasted about twenty minutes took six, only one of which was "over count," he weighing 3½ pounds. During the following week I had varied luck. My best day was in Crystal Creek, which empties into the bay near the lake, and about two miles from the Loop. On that day I brought home nineteen fish, weighing between 2 and 4½ pounds each.

I found royal-coachman, marsh-brown, brown-hackle, klamath, rooney-bug, and black-gnat to be the most killing. Two days before I had to leave, I went out determined to kill a few large ones to take out with me, but a dead calm destroyed my plans. The next day found the same conditions, so the Doctor kindly suggested that I join them, and try for a big one with a spinner out in the lake.

That morning I passed about thirty minutes in a fisherman's ecstasy. I was in the bow, next came Jimmy, then Hansen the boatman, the Doctor in the stern. The latter was using his 9-ounce Leonard, Kentucky reel, and large spinner. We had picked up two or three fish, the largest weighing about 6 pounds, when suddenly the Doctor struck, and then began a battle royal such as very few have had the happiness to witness. The Doctor had out about 75 feet of line when the fish struck, and before he could settle down to work and give him the butt, his highness had taken out another hundred feet. At the first check we saw a flash of silver about 200 feet astern, and out he came, three feet out of water if an inch, and with a vicious shake of his noble head he tried to rid himself of his bonds. The Doctor—cool as the proverbial cucumber—quietly puffed at his cigar, never for a second losing command of his prize. The moment the fish returned to his element, he made another 75-foot dash that nothing could have stopped. Then out again in his noble fight against that 9 ounces of tried bamboo in the hands of a prince of fishermen. Six times within ten minutes did he leap more than his length out of water, the last one seeming to me as furious as the first. Then the butt began to tell. Slowly but surely we saw the beginning of the end, and the gamest fish that ever swam was gradually forced to submit to the will of as perfect a legitimate fisherman as ever cast a fly. Carefully, inch by inch, the Doctor gained on him, the boatman always keeping him properly placed. Inch by inch did that grand

fish fight for liberty. Sulking, tugging, but never gaining a bit of slack. Suddenly, when we thought him about gone, and when within a few feet of us, he saw the boat, and as we were preparing net and gaff he suddenly made another fifty-foot dash, bringing from the Doctor the only words he had spoken, an exclamation of surprise.

There must be an end to everything, and we then saw that the last run was like the breaking of a noble heart, and again the fish was headed for the waiting net, and at a word from the Doctor we landed eighteen pounds of rainbow, after one of the gamest battles I ever witnessed.

After taking a gill hold and giving him his quietus with the "medicine stick," we gazed, lost in admiration, at the king of all fish—a rainbow trout fresh from his native waters. The Doctor told me afterward that during the battle I acted like a fool; but experience having taught me how dearly a fisherman loves to be told how to handle his fish, I was most careful not to offer any suggestions, even if I did show excitement. The Doctor was by far the coolest man in the boat. I weighed the prize and he went 18 pounds strong.

The next morning I was obliged to leave for Ashland, taking the big fellow with me, after having spent ten absolutely happy days.

C. MEREDITH.

### Fish and Fishing.

#### "Maskinongé" is its Name.

Following up the agitation which the undersigned, in company with several other friends of FOREST AND STREAM has conducted in the columns of this paper, in support of the uniform use of the original Indian name "maskinongé," it will doubtless be satisfactory to the angling fraternity, which is so often confronted with a perplexing assortment of etymological forms of this fish's name, to learn that the newspaper press and the governments of the various States and Provinces in which this fish is found are now being asked, in accordance with a resolution to that effect, passed by the North American Fish and Game Protective Association, to assist in bringing about the desired uniformity. The resolution bearing upon the subject was moved by Mr. L. O. Armstrong, of Montreal, the well-known dramatizer of "Hiawatha," and was adopted, after reference to the executive of the association, as follows: "That all governments in their statutes, as well as the press, be requested to assist in establishing the name of the fish which is sometimes called muskellunge, maskelonge, and muskinonge, to be always and everywhere maskinongé, which has been fixed upon as the right name in the Dominion of Canada statutes, and the pronunciation of which is practically the same as that of the Ojibway word maskenozha, as found in Longfellow's "Hiawatha," which is a classic in schools on both sides of the boundary line."

Maskinongy or maskinonjy is a much nearer representation of the correct pronunciation of maskinongé than Longfellow's form of the word, but due allowance must be made for poetic license, and for the fact that the name is not supposed to have originated with the special people of whom the poet of the affections sung in this particular epic. Longfellow's vocabulary of the Indian names employed in Hiawatha tends to show that it was not the maskinongé but the pike that he referred to by the title of maskenozha. In the body of the poem he causes Hiawatha to address the pike both as kenozha and maskenozha, while the former is given in the vocabulary as the equivalent of the pickerel, and the pike is made to answer to maskenozha.

I have already pointed out in the course of a paper prepared for the Royal Society of Canada, that kinongé in the Algonquin language signifies a pike, and mask or maskh "something differing from," as an ugly or deformed specimen. Jordan and Evermann quote Mr. W. H. Henshaw as giving mask, ugly; and kinongé, a fish; and Mgr. Laféche, late Bishop of Three Rivers, and for many years a missionary to the Northwest, asserts that in the dialect of the Saulteaux, maskinongé is the name applied to *Lucius masquinongy*, and means, literally, a pike differing in some respects from the ordinary type of the fish, or an ugly or deformed pike. When we consider how many American anglers and others have mistaken large pike for maskinongé, it is not very surprising that the Indians who had been accustomed to the pike before seeing the maskinongé should have considered it to have been simply an exceptionally large pike, and to have named it accordingly.

Dr. James A. Henshall credits Mr. Fred Mather with having investigated the origin and etymology of the word to a greater extent than anyone else up to his time, and with having, as a consequence, deliberately favored the Chippewa form of the name—maskinonje, as opposed to the French derivation—Masque allonge, and its variations. Yet in spite of this fact, and of the priority of the Indian over the French nomenclature, Dr. Henshall clings to the supposition that "common consent and custom have decreed among the majority of anglers that it is maskelonge, and maskelonge it will be for generations to come," notwithstanding which, Jordan and Evermann do not even recognize the existence of such a name at all, giving only masquinongy, muskallunge, maskinongy, muscalonge, maskinongé, maskenozha, and mask-kinonge.

There is fortunately a complete agreement among scientists and writers on angling subjects as to the scientific name of the fish. Dr. Mitchell, according to De Kay, and Kirtland, as early as 1838, used the form *masquinongy*, and although it had later become almost universal custom to class the fish scientifically as *Esox nobilior*, all the authorities, nowadays agree that in accordance with the inflexible law of priority, *nobilior* must now stand aside and give place to *masquinongy*, and that the scientific name of the fish must hereafter remain *Lucius masquinongy*. Now, there is no difference whatever between the pronunciation of the specific name *masquinongy*, the Chippewa form maskinonje given by Mather, and the orthography maskinongé, contended for by the North American Fish and Game Protective Association. None of the Indian tribes whose nomenclature has been appealed to in this connection, had ever, of course, reduced their name of the fish to writing prior to the advent of Europeans in America. The early French settlers in those parts of Canada in which the fish was found, reduced to writing the names *kinongé*, a pike, and *maskinongé*, an unusual or extraordinary pike, employing their own French system of orthography to represent, as closely as written characters could do so, the Indian pronunciation of the names. How carefully and how correctly this was done is shown by the practical identity of maskinongé with both Mitchell's masquinongy and Mather's maskinonje. Their pronunciation, as already shown, is identical, while the difference in their form is to be accounted for by the fact that the first mentioned is in strict accord with the orthographical rules of the language of those who first represented by written signs the sound of the name as pronounced by those who conferred it. While maskinongé follows the strict rules of French orthography, the construction of both masquinongy and maskinonje bears evidence of the best possible efforts to arrive at the same result of pronunciation with an Anglicized spelling of the Indian name and of its previous French form.

The Government of the Dominion of Canada, in which the names originated, which possesses exceptional advantages for investigating matters of this kind, owing to the common use of the two languages, has recognized the priority of the French form of the written word, and has incorporated it into its statutes. The river of the same name that flows into Lake St. Peter, which name has been extended to the town built at its mouth, and the county of which it is the *chef lieu*, was doubtless so called from the number of these fish taken in or near its estuary, and after their Indian name.

It is not very often that the scientific specific name of a fish is so easily available for common use as in the case of *Lucius masquinongy*. Fortunate, indeed, would it be were it otherwise, for endless confusion might then be avoided in speaking or writing of fish and fishing. Here, then, is another reason why we should welcome the opportunity of an uniform employment of the name maskinongé, which differs but very slightly, indeed, in its written form from the scientific name of the fish, and is identical with it in the matter of pronunciation.

E. T. D. CHAMBERS.

### Some Piedmont Fish.

A SIX-POUND jack or pike netted on the 21st of February from the fine fish preserve of Herbert Lutterloh, Esq., of this city, has attracted comment among anglers by its unusual depth of body in proportion to its length, and by the entire absence of bar marks or spots, its complexion being of a solid greenish cast precisely like that of a small-mouth black bass. A difference was also noted in the shape of the head and opercles, and tail fins (caudal), and some suggested that it was a hybrid—jack and trout (local for black bass), being together in the creek in equal proportion. This opinion, however, was modified by the discovery that its chunky proportion was due to the presence of two recently swallowed half-pound red horse, or golden suckers, in its maw, a fact interesting in itself as indicating that so long as there may be an abundance of this class of food, the trout and bass are likely to live in amity, and not prey upon each other; also because large quantities of the red horse were gill-netted, indicating that they were running in schools, and that the jack fish were following them. Those caught averaged two pounds apiece, and if intended to be swallowed, the predatory fish must be large in proportion.

This Lutterloh preserve is the finest in Cumberland county, and is laid out on Beaver Creek, a tributary of Rockfish Creek, which empties into the Cape Fear River, which is noted for its fine shad, the waters of all the streams being exceedingly bright and clear. There are no less than seventeen ponds in the vicinity of Fayetteville, of which several are mill ponds, five are private waters belonging to wealthy residents, and one to the Lakeview Club. These latter are all fine properties with all modern accessories. There is also a wealthy fishing and shooting club on Rockfish Creek, twenty miles below here, which includes several Fayetteville members. Duck shooting and striped bass fishing (*Roccus lineatus*) are quite above par there, as ex-President Cleveland discovered some time ago.

All the Cumberland county streams come from the Ap-

palaeohian foothills (the Piedmont), and are hard to beat for purity. Mr. Y. C. Ravenel, of the Smithsonian Institution, sent a earload of small-mouth bass and rainbow trout down here four or five years ago, for distribution as stock fish, at my suggestion, and they thrive remarkably, the trout attaining several pounds weight in two or three years; but an untimely flood carried out nearly every dam, and they have been *non inventus*.

Mr. Lutterloh deprecates the absence of many fine southern food fish like the jaek, the black perch, and blue bream from the National Aquarium, and proposes to see that they are represented there at an early day.

CHARLES HALLOCK.

FETTERVILLE, N. C., Feb. 22.

### Thirty Years Ago To-day.

From FOREST AND STREAM, March 12, 1874.

DR. FLETCHER has lately procured 265,000 salmon eggs and placed them in Robinson's Fish Nursery in Meredith village, N. H. When hatched they are to be placed in the Connecticut River.

Having made inquiries of Mr. W. E. Newton in regard to the success he had met with in introducing prairie chickens on Long Island, he informed us that about two years ago he turned out about thirty brace of good lively birds, coming from Iowa, and that they are breeding and doing quite well. Several packs of young birds were seen last summer, and their peculiar tracks were very often noticed on the snow this winter. As far as possible they have been most carefully preserved, and will not be disturbed until 1877. This is quite an interesting fact. There is no doubt but that fifty years ago prairie chickens were found on Long Island. Should the birds be found even in moderate quantity at the expiration of their time of rest, Mr. Newton's effort to bring back the pinnated grouse to our neighborhood will no doubt be repeated in other sections of the country.

### Death of "Adirondack" Murray.

REV. WILLIAM HENRY HARRISON MURRAY, popularly known as "Adirondack" Murray, died at his home in Guilford, Conn., March 3, aged sixty-four. Mr. Murray won his sobriquet by the publication in 1868 of his well known book, "Camp Life in the Adirondack Mountains." It was a fresh, breezy, and enticing description of adventures and open air life in the wilderness. Others had written of the North Woods, but no one before had so caught their spirit, nor had any pen been gifted with the charm of Murray's to attract such attention and awaken such interest in the woods life he pictured. There had been writers before him, but for all practical purposes Murray was the discoverer of the Adirondacks, and it was the impulse of his book that sent the people to the North Woods in multitudes which have grown with the years.

### Kipling's Pacific Salmon.

Editor Forest and Stream:

Will you grant me space to ask that some of your Pacific Slope readers will advise me, naming volume and page, where I can find the statement by Mr. Rudyard Kipling that the Pacific salmon rose to his flies? H.

### On a River Bank So Green.

I sorter look away off,  
Where the sky is all serene,  
An' I want to take a day off  
On a river bank so green.

Fish, fish, fish,  
An' the line a-goin' "Swish!"  
(O the perch is sich a beauty  
When he's fried an' in the dish!)

The trees, like big umbrellas,  
Hide the hot sun from yer view—  
Dip their green leaves in the river,  
Till they drip with crystal dew!

Fish, fish, fish,  
An' the line a-goin' "Swish!"  
(O the perch just fits the palate,  
When he's fried an' in the dish!)

So, I sorter look away off,  
Where the river bank I see;  
An' the Wind says: "Take a day off,  
An' go loafin' roun' with me!"

Fish, fish, fish,  
An' the line a-goin' "Swish!"  
(O the perch—he's just so purty  
When he's fried an' in the dish!)

—Frank L. Stanton in Atlanta Constitution.

### Legislation at Albany.

ALBANY, March 5.—Bills amending the game law have been introduced in the Legislature the past week, as follows:

Senator Malby's (Int. No. 538), amending Section 86 so as to provide that fish, excepting suckers and billfish or garpikes, shall not be taken in Black Lake or in the Oswegatchie River from the boundaries of the city of Ogdensburg to the village of Heuvelton, excepting from May 1 to Nov. 15, both inclusive.

Senator Ambler's (Int. No. 603), amending Section 16, providing that a violation of Section 13b (close season for hares and rabbits in Dutchess county) shall be punishable by a fine of \$25, and for each hare or rabbit sold in violation of such section an additional penalty of \$10 shall be imposed.

Senator Ambler's (Int. No. 600), adding a new section, to be known as Section 22b, and providing that the close season for quail and woodcock in Dutchess county shall be from Dec. 1 to Oct. 15, both inclusive.

Senator Ambler's (Int. No. 606), adding a new section, to be known as Section 13b, providing that the close season for hares and rabbits in Dutchess county shall be from Dec. 1 to Oct. 15, and that such hares and rabbits shall not be sold during the close season.

Senator Ambler's (Int. No. 604), adding a new section, to be known as Section 62a, and prohibiting fishing through the ice in Dutchess county, and forbidding the use of tip-ups and nets except that minnows may be taken.

Senator Ambler's (Int. No. 601), adding a new section, to be known as Section 27c, providing that there shall be no open season for grouse in Dutchess county prior to 1907.

Senator Ambler's (Int. No. 602), adding a new section, to be known as Section 12c, providing that the close season for gray squirrels in Dutchess county shall be from Dec. 1 to Oct. 15, both inclusive.

Senator Ambler's (Int. No. 605), adding a new section, to be known as Section 176a, providing that special game protectors appointed by the Forest, Fish and Game Commission for Dutchess county shall have the same powers as game protectors without exception, provided they are employees and paid by a society or corporation within the county for the protection of fish and game.

Assemblyman Chanler's (Int. No. 870), amending Section 86 so as to allow the taking of suckers with nets through the ice in Crumelbow, Dutchess county.

The Senate Committee on Forest, Fish and Game has introduced a bill defining the boundaries of the Adirondack Park.

The Senate Forest, Fish and Game Committee has also introduced a bill creating the Catskill Park and defining its boundaries.

The Senate Game Committee has reported the bill of Senator Townsend (Int. No. 12), for the protection of wild black bears, amended so as to except Essex county, and striking out the additional penalty of \$150 provided for taking or possessing a bear.

The Senate Game Committee reported two of Assemblyman Reeves' bills as follows:

Int. No. 376, Pr. 623: Providing that deer shall not be taken at any other time than between one-half hour before sunrise and one-half hour after sunset on the first two Wednesdays and first two Fridays after the first Tuesday of November, and further providing that possession of wild deer or venison between Aug. 31 and the first Wednesday after the first Tuesday in November, and between the second Friday after the first Tuesday and Nov. 20, shall be conclusive evidence of a violation of this section, unless it appear that the same was lawfully killed within the State, or was killed without the State.

Int. No. 438, Pr. No. 477: Amending Section 158, relative to the renewal of leases of oyster lands.

The Assembly Game Committee has reported the following bills:

Assemblyman Stevens' (Int. No. 769, Pr. No. 833), making the close season for trout in White Creek in the towns of Hoosick and White Creek, Rensselaer and Washington counties, from Sept. 1 to April 30, both inclusive.

Assemblyman Whitney's (Int. No. 741, Pr. No. 876), prohibiting perch fishing in Saratoga county between Feb. 1 and May 1, both inclusive.

Assemblyman Whitney's (Int. No. 552, Pr. No. 613), making the close season in Saratoga county for black and gray squirrels from Dec. 1 to Oct. 31; for hares and rabbits, from Jan. 1 to Sept. 30; for mink, skunk, muskrat and foxes, from May 1 to Sept. 30; and for grouse, woodcock and quail, from Nov. 1 to Sept. 15, all inclusive.

Assemblyman Patton's (Int. No. 611, Pr. No. 692), amending Section 20 so as to provide that wild ducks shall not be taken in the counties of Niagara and Erie from March 15 to Oct. 15, both inclusive; nor shall ducks, geese, brant and swan be taken in the night from an hour after sunset until an hour before sunrise.

Assemblyman Nichols' (Int. No. 284, Pr. No. 294), amending Section 26, making the close season for woodcock in Sullivan and Greene counties from Dec. 1 to Sept. 30, both inclusive, and in Orange county, from Dec. 1 to Oct. 15, both inclusive.

A bill has been introduced by Assemblyman Prentice (Int. No. 847) amending Section 141 so as to prohibit the possession of game out of season, which comes from out of the State.

The Assembly has advanced to third reading Assemblyman Hanford's bill (Int. No. 608, Pr. No. 907), amending Section 59 so as to provide that bullheads, catfish, eels, perch and sunfish, and except during the months of March and April, pickerel may be taken through the ice with hook and line or tip-ups, in Cayuta Creek and its tributaries, and the Susquehanna River and its tributaries in Tioga county.

The Assembly has passed the following bills:

Assemblyman Harvey's (Int. No. 482, Pr. No. 848), providing that the close season for black bass in Seneca Lake shall be from Jan. 1 to Sept. 15, both inclusive.

Assemblyman Wolf's (Int. No. 383, Pr. No. 886), providing that fish shall be taken only by angling in Sheepshead Bay and Rockaway Inlet.

Assemblyman Dickinson's (Int. No. 160, Pr. No. 883), fixing the close season for hares, rabbits, mink, skunk and trout in Cortland county.

### Fly-Casting at New York.

THE completed scores of the fly-casting tournament at Madison Square Garden, for the events not recorded in our last issue are as follows. For the conditions and rules governing the contests see FOREST AND STREAM of Feb. 13.

Class R—Dry fly-casting for accuracy; open to all:

Total.	Total.
R. B. Lawrence..... 93 3-5	H. G. Henderson, Sr..... 95 1-5
R. C. Leonard..... 96	C. G. Levison..... 93 4-5
D. Brandreth..... 96 2-5	D. T. Abercrombie..... 95 3-5

Class S—Trout fly-casting contest; right and left-hand event; distance only; weight of rod and length of leader unrestricted; open to all:

Av. Distance.	Av. Distance.
H. G. Henderson..... 66ft. 5in.	R. C. Leonard..... 92ft.
D. T. Abercrombie..... 65ft. 9in.	L. S. Darling..... 77ft. 9in.

Class T—Single-handed bait-casting contest for distance and accuracy; open to all:

Score.	Score.
D. T. Abercrombie..... 105.10	C. M. Luckey..... 145.9
G. C. Levison..... 152.7	E. T. Mills..... 133.6
M. H. Smith..... 128.9	H. De Raasloff..... Withdrew.
L. S. Darling..... 121.10	R. C. Leonard..... 174.5
H. G. Henderson, Sr..... 125.5	R. B. Lawrence..... Withdrew.
H. W. Hawes..... 143.5	

Class U—Light trout fly-rod contest; distance only; open to all:

Distance.	Distance.
L. S. Darling..... 84ft. 6in.	D. T. Abercrombie..... 69ft.
H. G. Henderson, Sr..... 68ft.	R. C. Leonard..... 94ft.

Class V—Trout fly-casting contest; distance only:

Distance.	Distance.
J. G. Knowlton..... 75ft. 4in.	L. S. Darling..... 79ft. 9in.
E. J. Mills..... 75ft.	D. Brandreth..... 78ft.
D. T. Abercrombie..... 74ft.	R. F. Cruikshank..... 82ft.

Class W—Single-handed bait-casting; for distance only; open to all:

Distance.	Distance.
R. C. Leonard..... 94ft.	C. G. Levison..... 72ft. 5in.
H. W. Hawes..... 100ft. 2in.	(Withdrew after four casts.)
E. J. Mills..... 106ft. 10in.	M. H. Smith..... 36ft. 6in.

Class X—Single-handed trout fly-casting contest; distance only; open to all:

Distance.	Distance.
W. R. Pryor..... 76ft.	L. S. Darling..... 86ft. 6in.
D. T. Kennedy..... 69ft.	J. G. Knowlton..... Withdrew.
E. J. Mills..... 91ft. 6in.	D. T. Abercrombie..... 74ft.

Class Y—Black bass fly-casting contest; distance only; open to all:

Distance.	Distance.
D. T. Abercrombie..... 69ft.	L. S. Darling..... 90ft.
H. W. Hawes..... 93ft. 4in.	E. J. Mills..... 94ft.
R. C. Leonard..... 102ft. 1in.	

Class Z—Single-handed bait-casting contest; distance only; open to all:

Distance.	Distance.
E. J. Mills..... 114ft.	R. C. Leonard..... 123ft. 4in.
C. M. Luckey..... 69ft.	D. T. Abercrombie..... 88ft.
M. H. Smith..... 101ft.	H. W. Hawes..... 109ft. 4in.

Class ZZ—Single-handed trout fly-casting contest; distance only; open to all:

Distance.	Distance.
R. C. Leonard..... 106ft.	H. W. Hawes..... 104ft. 2in.
E. J. Mills..... 96ft.	L. S. Darling..... 84ft.

## The Kennel.

### Legal Status of Barking Dogs.

NEW ORLEANS, La., Feb. 24.—A short time ago I sent you a clipping from the Times-Democrat concerning an injunction by an old and invalid gentleman against a neighbor for keeping a dog which barked all night and prevented sleep and rest. The dog was sent away, and is supposed to have died of a broken heart. You gave it editorial comment. The sequel appears in this morning's T.-D., which I inclose. J. H. SAMPEL, M.D.

"The Court of Appeals yesterday passed upon the case of Joseph H. Marks vs Geo. D. Luce, known as the dog case, sustaining the decision of the lower court. Judge King, before whom the case was heard originally, granted an injunction which compelled Mr. Luce to abate the nuisance complained of in the petition filed by Mr. Marks, which was the barking of a dog owned by the defendant. Mr. Luce appealed the case, but meanwhile the dog, which was the cause of the litigation, died of a broken heart. Notwithstanding this fact the court considered the issues put forth, and yesterday gave its opinion. The Court of Appeals also affirmed that part of the decision of the lower court awarding Mr. Marks damages in the sum of \$250.

"It will be recalled that Mr. Marks, who is an aged man, and a sufferer from chronic heart trouble, instituted this suit for the purpose of stopping the barking of a dog owned by Mr. Luce, who is a next door neighbor. He asked for damages as well as for an injunction. The syllabus of the opinion handed down is as follows:

"Any person whose rights are invaded may invoke the aid of the courts to prevent any act which, if done, would entitle him to damages. On the merits, the case is entirely with the plaintiff, and the judgment is affirmed."

### Fox Hunter Luck.

ENOSBURG FALLS, Vt.—When I have time I will tell you about one of your readers—Mr. Greenwood—riding out quietly and in a most comfortable manner and shooting from his sleigh a couple of foxes that Hartly and Hannibal were running their legs off trying to get even a glimpse of. Each of their hounds had a fox going, and they were racing back and forward from hill to hill trying to get a sight, if not a shot, at one or both of the foxes. The whole story is too funny for anything, and when I have time I'll tell it, though Hartly is walking around on his toes with blood in his eye, and it is dangerous business to mention that particular hunt. S.

## Camp-Fire Flickerings.

"That reminds me."

NILWOOD, Ill., Feb. 15.—We noted Mr. Cristadoro's seasonable stories in the February 13 number, and thought we had our champion cornered with the rabbit story. We read it when he was present, expecting him to quietly pull his freight to where a champion would be respected and looked up to. Not so, however. When we finished, he settled back, and, after spitting on the stove door knob, remarked: "Yes, that's a good way. I caught two four-horse wagonloads of geese that way out in Missouri."

Needless to say we did not spring the wolf story on him, but ordered him to leave the place, which he proceeded to do, and while on the way to the door, said: "Talk about catching game and hunting in general and queer experiences, I want to say I had one that is hard to beat. It was in the fall of '88; I went hunting chickens one afternoon, and fired at one chicken that started to fly straight up after the shot was fired. I watched him for a while until he got out of sight, and then went on hunting, thinking it was a queer thing for a chicken to fly straight up until it got out of sight. The next afternoon, about the same time as the day previous, I started out again and went over the same ground. When I came to the place I had stood when the chicken went out of sight, I stopped and was thinking of the circumstance when chuwhum! I heard something hit the ground by my side. Upon investigating I found it was a dead chicken. I don't say it was the one I shot at the day before, but if it wasn't, where did it come from?"

If you can't come to the front with something pretty stiff, we will not try again to get ahead of the "good old Deacon," who has a reputation to sustain, and comes near doing it. He was a soldier in the Civil War, and has had all the good times, bad times, queer times and experiences that could come to any one man, so if there is nothing that can beat the rabbit story, we won't read them to him.

I hope someone will come to the front with a good one that will make the "Deacon" go without a single remark. We are somewhat on the story ourselves, but have nothing to say when the "Deacon" is near. J. P. B.

## The Shenandoahs Cruise the Greenbrier.

BY F. R. WEBB ("COMMODORE"), OF STAUNTON, VIRGINIA.

The Story Which Won the Fourth Prize of \$10 in "Forest and Stream" Cruising Competition.

### II.—The Log.

(Continued from page 193.)

THURSDAY, JULY 2, 1903.

We remained here quietly and lazily in camp all day, reading, loafing, dozing, etc., and in the course of the day at least six or eight inches of water ran off ahead of us. After breakfast I took the tent off my canoe and all the camp plunder out of her, and launched her, and paddled back up the river half a mile and across, where I landed and walked back up the railroad another half mile to a farmhouse, high up on the hillside, where I procured some much needed supplies, returning laden with fresh eggs, butter, lard, and a loaf of "salt risin'" bread. We did a little fishing this afternoon and evening close around camp, but with only fair success; making enough of a catch, however, to provide ourselves with an ample fish supper, as well as a supply for the morrow's breakfast. We have been troubled more or less with a perfect pest of black gnats at night at our various camps. The first night out, at Durbin, they were specially obnoxious, and George produced a couple of boxes of some sort of villainous compound labeled "Lollicapop," with which we anointed our hands, wrists, and faces. It proved a tolerably efficient protection, as none but the hardest veteran of a gnat or mosquito had the nerve to face it; but after some two or three nights of it I preferred to take my chances with the bugs. Merely leaving the box open in the tent had the effect of driving out hundreds of the younger and more callow gnats, who were quite unable to stand the "sad green smell," as George termed it. They had my sympathy.

FRIDAY, JULY 3, 1903.

We had a five o'clock call this morning, and were packed and afloat by 7:30, with nearly a foot less water under us; which, while it still gave us a sufficiency of water for cruising purposes, greatly improved the fishing; and we went into camp at one o'clock with quite a cargo of fish in the hold of George's smack. He fished all through the morning's cruise, as usual, while I, as usual, contented myself with loafing along beside him, or astern, and enjoyed to the utmost the cruise and the exquisitely beautiful scenery. Although we got down to the bottom on more than one shallow rapid, we found the cruising preferable on this lower stage of water, as the river is in a more normal condition, and we see it as it really is. Our morning's cruise of fifteen miles was a most interesting one, and took us through the noted Droop Mountain gorge, considered to be the worst place on the river; and one much dreaded by the old-time loggers and rafters. At this place, twenty-five miles below Marlinton, the river breaks through the mountain chain, and continues its course down the next valley to the west, and we had been hearing of this Droop Mountain gorge pretty much all the way down the river, with warnings plentiful as to its dangers; and we approached it with considerable interest, albeit we did not anticipate any particular trouble in getting through. We found the place all right enough, and the rapids followed each other thick and fast, the Spice Run rapid coming first, followed by the Copperhead Rocks, Davy's Run, Glen Rocks, and McClure Rocks, with perhaps one or two others of lesser note. We found them but little different from the constant succession of rapids we had been running all the way down the river, and none of them gave as much trouble as the frequent sharp pitches to be found on the upper river between Cass and Durbin. The Spice Run rapid afforded us rare sport as its big waves smashed and rolled over our decks and closed hatches in true Shenandoah fashion, although the channel was perfectly clear of rocks—plenty of the latter, however, being strewn in promiscuous confusion up along under the railroad embankment in the concavity of the bend. After running the rapid I landed and climbed the railroad embankment and took a snap at George with the kodak as he came pitching and tossing down the tobaggan slide. The Copperhead Rocks we found much longer than usual, and quite rocky, particularly around the bend to the left, and much care was required to thread our way in and out among them, but the run was successfully made, and we reached the bottom without striking anything or anywhere. In fact, the entire gorge was run with perfect ease by the exercise of a little skill and care, and we found nothing to dread in this passage at all. The run is interesting and exciting, but presents no difficulties that the practiced canoeist cannot surmount by the exercise of ordinary care. It is but fair to state, however, that our information was entirely from the standpoint of the loggers and

raftsmen, and not from that of the canoeist. It is one thing to run a light, easily managed canoe down one of these rapids at low water, and quite another to come down over them aboard of a heavy, unwieldy roofed log raft on top of a head of water from 4 ft. to 8 ft. higher, or even more; a stage, in fact, on which the entire run of seventy miles from Marlinton to Ronceverte was made in one day, when the water rushes down these steep inclines with irresistible power and violence. The perils are much enhanced by the fact—indeed the entire risk is due to this fact—that the river is exceedingly tortuous in this gorge, and the water piles down the rapids and up against the rocks on the bank with such force, the river being, as a rule, quite narrow through here, that it is only with the utmost labor and skill that a raft can be swung around the bends without jamming the bow end into the bank or on to the rocks at the bottom of the concave shoots. Lives have been lost in here, and more than one of these rifts owes its name to some unfortunate who was shipwrecked and drowned, notably the Davy's Run rapids and the Glen Rocks rapid. In the latter a man named Glenn is said to have lost his life while taking down a raft of hewn timbers with which to build the bridge at Caldwell which was buried nearly forty years later during the war. This raft is supposed to have been one of the earliest rafts ever run down the river. It has been some years since any rafting has been done on the river, and now that the railroad parallels the river, it is not likely that any more rafting will be done, to say nothing of the numerous sawmill plants located in the valley along the line of the road, some of them of immense capacity, although while at Marlinton I heard rumors of one more rafting expedition to be fitted out in the spring; probably owing quite as much to the desire of the old raftsmen to once more run the river, with its attendant excitement, as to anything else.

We passed Droop station presently, which we knew to be below all of the worst water, immediately below which the river made a sharp turn to the left and wound its sinuous way around a long projecting spur of the mountain, which the railroad cut off by the simple expedient of a tunnel, and for several miles the scenery was of the wildest, albeit the water was not worse than usual. This loop is known as the "big bend," although there is a much larger "big bend" further down the river, some miles below Alderson, on the main line of the Chesapeake and Ohio road, where the railroad cuts off 15 miles of river by a tunnel  $1\frac{1}{4}$  miles in length. The mountains hemmed the river closely in on either side and towered aloft so high that the head became dizzy in trying to locate the summits. Great masses of broken, stratified cliffs cropped out among the trees high up on the mountainsides, or towered high above the treetops and clear to the summits in fantastic, castle-like formations which were picturesque and interesting. We were in the densely shaded windings of this gorge for an hour or more, before, with a sharp twist to the left, the river emerged from the fastnesses of the mountains and the country became more open, while at the same time the railroad sprang out from the mountain wall through the end of the tunnel, and again ran high up along the bank of the river on our right. We began to look for an eligible camp-site, and in the course of an hour a beautiful turf bank, well shaded by large trees, appeared on our right, the railroad obligingly retiring a quarter of a mile inland along the foot of the mountain range, and on landing to prospect for a camp-site I poked the investigating nose of my canoe into a fine cold spring at the water's edge. We were not long in getting our plunder ashore and our camp in shape, after which a plenteous repast, consisting of a can of hot soup and succotash, with a pot of hot coffee, was stowed away, and the afternoon devoted to the interesting and pleasant occupation of loafing. A brisk little shower drove us to the shelter of our tents, but it did not last long, and was not severe enough to promise any effect on the river. We had a visit late in the afternoon from an ancient fisherman, who was pursuing his avocation on the opposite side of the river as we came down, and who poled across in his primitive boat after our tents became in evidence. I offered him a toddy, which he accepted with the remark that he took his liquor different from most men, which statement he proceeded to verify by putting a teaspoonful of sugar in the bottom of the glass I gave him, after which he filled the glass with five fingers of straight whiskey—no water—and after stirring the sugar well in, he proceeded to partake of the result, teaspoonful at a time, much as an old lady would sip her cup of tea. He expressed his appreciation of the brand of "licker" with which we were provided, and declined a second help, and shortly after got in his big wooden boat and poled himself back across the river, well laden with most of George's morning's catch, there being more than we could possibly use ourselves. We had a royal fish supper off a big three-pound bass taken by George in the course of the morning, and after a few trials with our fly tackle in the twilight, with no results, we passed the evening pleasantly around our little camp-fire, over our pipes. As the sun dropped behind the towering wall in the west, the full moon appeared over

the crest of the ridge to the east, and flooded the narrow valley with her silvery radiance, and the night was a beautiful one.

SATURDAY, JULY 4, 1903.

We got an early start this morning, and were afloat and under way by 7:30. I rigged up my fly-tackle and fished during this morning's cruise, with very good success, while George with his diabolical "sardine" had his usual luck, and his fish-bag was soon quite well loaded. He got rid of his morning catch later by giving the entire lot to a fisherman in the river a short distance below Falling Spring. Our run for the first few hours—until it got too blazing hot for comfort, for this was a hot day, and the first taste of real hot weather we had on the cruise—was an exquisitely lovely one. The beautiful river is nowhere more beautiful than in this section. After passing out of the Droop Mountain gorge the valley opens out considerably, and our morning's cruise was through country that, while it lost nothing in picturesqueness and beauty, was not so depressingly wild and primitive. The river also became broader and more open, and the water began to lose its trout-stream amber tint, and to take on more of the slaty blue tint so familiar to travelers on the main line of the Chesapeake and Ohio road who are accustomed to admire its beauties from the car windows as the trains speed along its banks between Ronceverte and Hinton. A few miles below our camp we skirted along under a frowning cliff with the railroad clinging to its face in a narrow little notch a few feet above the water. At this place there was formerly a most picturesque line of castle and chimney-like formations jutting out from the wall, but unfortunately the railroad right of way had destroyed every vestige of them. The scars on the face of the cliff where these formations had clung to the rocky wall behind were plainly apparent as we drifted smoothly and swiftly by. The water is still and deep along here, and the images of the cliffs, trees, etc., were faithfully reproduced in an inverted position, broken and distorted into wavy lines as the water rippled and swirled from our paddles and the bows of the gently moving canoes. We found the water getting down on us a little on this morning's run, and we had to get out and wade down two or three rapids that were broader and shallower than usual, with our lightened canoes drifting easily ahead of us at the length of the stern painters; but as a rule we found a sufficiency of water, and didn't mind these few exceptions. We reached the village of Falling Spring, nestled high up on the hill tops a little ways back from the river, and hung up here for an hour and more while I went up into the village for mail and supplies. There are two towns here—Renick, a product of the railroad, down on the river bank at the station, and Falling Spring, half a mile up the hill, and almost straight up, at that. Knowing nothing in advance of Renick, I had had our mail addressed to Falling Spring, and a hot, tedious climb up the long hill was the result. However, I was rewarded by a goodly package of mail for both myself and George.

To-day being the Glorious Fourth, the whole country seemed to be out in gala attire, and all work or business seemed to be suspended for the day. It was 10:30 when we got under way again, and turned our bows down stream. The river turns sharply to the left just below the picturesque old covered bridge at this place, and shoots swiftly along under the railroad embankment, which lies up along the bluff in the concavity of the bend. About half a mile below the village we had a rattling lively plunge down a steep, rocky, and very rough little fall of about 50 yards in length, where, although our decks and closed hatches were liberally dashed with the spray from the big wave crests, we made the run without touching a rock. Not far below this fall the river turns sharply to the right again, and just below the elbow we passed the remains of an old dam, built as an aid to raft navigation, as the rapid above, in the angle of the bend, had proved peculiarly disastrous to many a raft, owing to the difficulty in swinging around the sharp corner without poking the nose of the raft into the bank or among the rocks which plentifully line the shores on either side. The dam has long been out of commission, and is broken out so that it presents no obstacle to canoe navigation, while the old sluiceway through which the rafts made the passage is still quite in evidence, but now perfectly dry. Just below and across from the old dam we landed on a beautiful, rocky, well shaded bank for a drink of water from a cold spring that rippled brightly down over the rocks and among the huge boulders into the river. It was such a beautiful spot that we loafed here quite a little while, enjoying the charmingly beautiful surroundings, and taking a rest from the heat of the sun. If it had been an hour later we would have made camp here, and we afterward regretted very much that we did not do so anyhow, for our next two or three days' cruises developed the fact that there is a singular scarcity of eligible camp-sites between Falling Spring and Ronceverte, and we had several hot, tedious hours to pass through on this morning's run before we finally went into camp. However, we did not know this, and we finally re-embarked and pushed on down, and about noon be-

gan to look for a camp, our desire in this respect being sharply accentuated by the fact that the sun had become most unbearably hot, and cruising was anything but a pleasure. None offered, and finally, about 1 o'clock, we landed on a shaded sand bank at the foot of an island, whose only recommendation was that it was immediately in front of a little shambling farmhouse, where we would be likely to find a supply of drinking water. It was directly opposite the mouth of Spring Creek, and George was anxious to camp here, as the swift water just above, rippling down around the foot of the island, seemed to be an unusually promising fishing ground; and also because Spring Creek was coming in muddy and discolored from some unknown cause, and George did not want to get into the muddy water for his afternoon fishing. George's principal interest in a cruise lies in the fishing, and he is keenly sensitive to anything and everything that bears on his favorite sport, one way or the other. Inquiry at the

The Fisherman.

house developed the fact that their supply of drinking water was obtained from a small creek coming in a couple of hundred yards below, and on walking down to inspect it I found that the water was quite as warm as the river water, and quite unfit to drink. An inspection of the other side of the river revealed no more favorable camping facilities, to say nothing of the discolored water from the creek being on that side; so in disgust George exclaimed: "You go ahead and find a place that suits you; I'll camp wherever you say!" So I pushed on ahead, George leisurely following on the clear side of the river, working his "sardine" as he came. I had a most distressingly hot mile or two's paddle, looking in vain for an eligible location on either side of the river, until finally I dropped hopelessly and helplessly ashore, completely done up with the heat, at the mouth of a small, cool looking brook coming in from under a high bluff on the sunny side of the river. The water looked tempting, and I plunged in my hands and soused my face and head in it, and found it to be almost ice cold; and as we both thought it unwise to pass it (George having come up by this time), we went ashore here for the rest of the day, and after lunch put up the camp. It was beyond a doubt the meanest and most uncomfortable camp I have ever made. A barren, rocky beach extended from the water's edge to the foot of the bluff, which rose steeply behind

The Big Dam at Roncverte.

it; the place was absolutely without shade, and the undergrowth, which straggled down the face of the bluff behind us, was almost impenetrable, and even when penetrated for a few feet with much difficulty, it was so close and hot as to be more unbearable than the sun outside. We spent a most wretchedly uncomfortable afternoon, which seemed to be absolutely endless, in that oven of a place, our sufferings alleviated to some extent by the fact that the sun was under a cloud for a large part of the time. Also I put in about an hour in swimming in the refreshing waters of the river. George, who would fish in Tophet if he could find a place where the water wasn't boiling, fished most of the afternoon, but with only fair success, and he finally laid aside his fishing tackle and went swimming also. As we seem to have a "Camp Damnation" on all of our trips—the Greenbrier trip, the Shenandoah, etc.—it seemed to me not inappropriate to christen this place "Camp Damnation" also. We had hoped to find a nice comfortable place and lie by and loaf over Sunday, but we turned in with the mutual assurance that no Sunday would be spent here, but a short Sunday cruise would be the order of the day.

SUNDAY, JULY 5, 1903.

We got up leisurely this morning and had breakfast, and lazily packed and launched our canoes, and it was fully 9 o'clock before we were afloat. We were in no hurry, as our camp ground was shady enough during the morning hours, and we only had in view a short Sabbath day's cruise, with an early camp and plenty of loafing; but, as it proved, we had our customary luck in finding a camp place, and we cruised not less than sixteen miles, and it was after 2 o'clock before we succeeded in locating a camp that was at all eligible. The day was cloudy and

overcast and the cruising quite comfortable, as well as full of interest. The mountains closed in on us again with wild, towering, tree-clothed walls close at hand on either side, with here and there gigantic rock masses looming up above the treetops on the mountain summits, or projecting in ragged masses out from the tree lines on the steep slopes, and the scenery was more like it was up above Cass. It presently began to rain, and for three hours we had a heavy thunderstorm, with furious driving rain; but, clad in our rubbers, we kept right on down the river. Running a rapid river in a heavy rain is ticklish business, particularly if the stream is unfamiliar; but we kept on going over short, still pools into which the rain beat fiercely, blistering the surface and spurting up in fierce little jets; and down rough, heavy rapids, where the surface indications were so obscured by the beating rain that it was decidedly ticklish business to keep off the rocks that did not show their heads above water. It was not difficult to diagnose the "set" of the water down the rapids, and we put our canoes in the likeliest looking water and took the rocks on trust; and got through rapid after rapid without mishap of any kind, including the really long and quite rough rapid just above the old covered bridge across the river a little above Anthony's Creek, known to the old-time raftsmen as the "bridge rapid," and about which we had been warned, and which we found quite as long and rough as the worst of those in the Droop Mountain gorge, and with the rocks strewn around thicker and in much more careless profusion. We got a few rather heavy knocks in here, but reached the bottom all right enough, right side up, and without injury to our canoes. Fortunately in this rainy morning's run, we found plenty of water, even in the broadest and shallowest rapids, and did not have to get out and do any wading in the rain. There were several earth-jarring thunder claps over among the mountain tops, but we felt secure, far down in the bottom of that abysmal gorge, as we felt certain that a lightning flash with any sense of discrimination whatever would much prefer picking out a tall, likely looking tree on some of the interminable mountain tops, rather than come nosing around in the

"We loafed here quite a while."

bottom of that trough in the mountains in search of a couple of very small and inconspicuous canoes; and the event proved that I was right. About noon the storm passed over, and the sun came out blazing hot, and made things interesting for us for the next two hours as we shot along down the swift river, scanning either bank closely in hopes of a camp-site that was at all favorable. Bend after bend was passed, and nothing appeared that was at all eligible. We had hoped to find a place at the mouth of Anthony's Creek, but the ground was densely overgrown with bushes, wet and bedraggled from the rain. Finally I landed on an open looking sand bank where a road dipped down into the river, and where the ground was sufficiently open to allow room for our tented canoes. Two or three fishing poles, cut from the nearest thicket, with lines attached, leaned against the bushes on one side of the road, indicating that human habitation was probably not far off, with promise of drinking water. Hanging on the hook attached to one of the lines was the dried and shriveled remains of one of those curious reptiles found only in the tributaries of the Mississippi known as "hellbender." The hook was still fast in the skeleton jaw, telling a mute, pathetic story of man's needless cruelty to the helpless lower orders. The roof of an old mill showed up through the trees a short distance up the road. We had easily shot the old, broken out dam half a mile above, and I walked back up along the road toward it, hoping to find water for drinking and cooking purposes. The old mill was found to be in ruins. The roof was tumbling in, the floor had dropped down below the underpinning in places, the doors and windows were all gone, and the place had the air of being decidedly out of commission. At the further end there appeared signs of occupation. A stovepipe was sticking out of a windowless hole in the wall; a few rude pieces of furniture were scattered around outside, and as I passed I caught sight of a frowzy, unkempt female head back of a sightless window, evidently watching me with some curiosity. Through another window opening a still frowzier and more unkempt male head was thrust. I looked no further for water, but returned to George with the news of my find, and we agreed that perhaps we might do better further down; so I re-embarked and we pushed on, hotter, hungrier, and thirstier than ever. A couple of miles below we hailed with delight the appearance of a bright little thread of water slipping noiselessly down the sandy bank, deep down in a little notch worn in the soft, sandy soil, and losing itself in the river. An old wooden boat lay half sunken in the water alongside of the little rivulet at a bit of a landing among the bushes. With one accord we rushed our canoes ashore alongside the old boat, and were rewarded by the discovery of a cold spring with an excellent vein of water welling out from under the roots of a huge sycamore, and with a really comfortable bank on which to place the canoes, well screened from the sun both morning and afternoon by a heavy growth of trees, without undergrowth enough to make things uncomfortable, and it did not take us long

to get our camp plunder ashore. The river bank across from us, and for a mile or more each way up and down the river, was a thousand feet high and almost straight up and down, tree-clothed to the summit, with here and there jagged cliff masses projecting their bulks in fantastic shapes far out beyond the tree line. The railroad lay along a narrow little shelf scratched into the face of the mountain some twenty or thirty feet above the river, which was piled full of broken rock masses along the water's edge at the foot of the embankment, and which were strongly suggestive of bass. On our side of the river a strip of level land a couple of hundred yards in width lay up and down the river, back of which Wallow-Hole Mountain lifted its crest fifteen hundred feet up into the sky. Along this narrow little strip of bottom land old man Blankenship had a little farm and lived in an humble little cabin a short distance from our camp with his grandchildren. While we were making camp the old man came along with a couple of neighbors—a

The Copperhead Rock Rapids—Mount George in Distance.

man and a woman—whom he was preparing to set across the river. While evidently surprised to find squatters on his land, he was cordial and pleasant, and assured us that we were perfectly welcome. The neighbors proved to be our passing acquaintances of the old mill above, and turned out to be agreeable and pleasant in spite of their unprepossessing abiding place. A good hot fish dinner was served at 4 o'clock, which did duty for supper, also, after which the canoes were drawn ashore and the tents erected over them, and the camp leisurely put in shape, including the fly, as the weather was by no means above suspicion. I settled down to my correspondence, while George improved the opportunity to go a-fishing. He made quite a nice catch, which, as we were pretty well surfeited with fish, we took to the old man's cabin and presented to him.

MONDAY, JULY 6, 1903.

As this place looked favorable for fishing, and as we had but a few days more for the cruise, George suggested that we lie by here a day and try the water; so after breakfast we took our tackle and sallied forth; but although we used first flies and afterward helgramites, neither of us scored a rise. The river was discovered to be rising, as a result of Sunday's heavy storm, which probably accounts for the bass refusing to strike; so, after

A Landing for Water.

an hour's fruitless exertion, we gave it up and returned to camp, and after George had set me across the river in the old man's boat I had a hot walk of a mile and a half up the railroad to a bit of a country store, where I had the expeditionary coal oil can filled. On my return I found the river was coming up quite rapidly, and by the middle of the afternoon there was a foot and a half of discolored, muddy water coming down, which of course knocks out the fishing, and will end the cruise tomorrow at Roncverte. It does not take these mountain streams more than two or three days to run clear after a rain, but, as I had only about that much time remaining for this outing, it did not seem worth while to wait any longer on the water. The afternoon was spent lazily in camp, reading, dozing, etc. The old man was down in camp a couple of hours during the afternoon. He has been a mighty hunter, and is now a mighty talker. George likes to hear him talk, and tell of his numerous hunting exploits and adventures, but I found him boring.

TUESDAY, JULY 7, 1903.

We got an early start this morning, and were afloat by 7:30, with a couple of feet more muddy water under us than we had when we arrived here. The old man was down while we were cleaning up the kitchen utensils and putting things to rights, and we turned over to him what few supplies, in the way of coffee, sugar, etc., that we had left over, which he thankfully accepted. We lingered lazily down along this last stretch of the river, loth to leave the beautiful stream at the last, albeit the flush water carried us along at a lively rate, and we had a quick and easy cruise of fifteen miles to Roncverte, arriving there at about 11 o'clock. The day's cruise reminded us in more ways than one of our elegant day's cruise between Cass and Marlinton. We found the rapids

about as they had been all along—occurring constantly, but not specially rough; in fact, we found this section of the river the easiest in that respect of any section that we had as yet cruised over. My chart gives a couple of 100 feet contour lines across the river at a distance of less than four miles between our camp and Caldwell, and we had expected to have rather a strenuous time of it this morning, but we found no indications of any unusual fall. We passed under the picturesque old covered bridge at Caldwell—curious how much alike all of these old bridges are!—and found a 3-foot dam below it, the first we have encountered on the cruise since portaging the dam at Cass, but with the present water we went right over it, after standing up in our canoes to diagnose the situation. Presently the main line of the Chesapeake and Ohio Railway appeared on the left bank, and we skirted along it for a couple of miles or so, until it crossed over our heads to the right bank on a fine iron bridge, immediately below which our little Greenbrier road, which has been keeping us company for the entire cruise, loses its identity in the main line. Long lines of old disused and decaying log booms, relics of the rafting days before the construction of the Greenbrier road, and indicating our approach to Roncverte, began to appear, and it was a nice question to choose the proper side at the head of a boom. We got on the wrong side of one of them once, and had to make a portage, fortunately an easy one, by stepping out on one of the links of the massive log chain and sliding our canoes over and through a little gap between the ends of the log links. The immense lumber mills of the St. Lawrence Company at Roncverte next appeared, past which we slowly paddled, arousing no little interest and curiosity in the minds of the numerous men at work on the river front, and the end of our cruise was close at hand, for in a few minutes more we beached our canoes on a grassy, well shaded bank immediately above the immense 20-foot dam at Roncverte, which to us was the foot of navigation, and our delightful and interesting cruise of two weeks and 110 miles was at an end.

We had plenty of time, as we had all day before us, so we took things leisurely. We unpacked the canoes and drew them up out of the water, and sorted out the

camp plunder—something of a task with George, as his canoe and part of his stuff was to return to Staunton, while a considerable part of it was to be returned by express to his home in Frostburg, Maryland, and still a third installment was to be made up and placed in his clothes bag and taken with him, for it was his plan to return up the Greenbrier road to Durbin, and thence go back to Arbogast's on the upper waters of the "Near Prong" (the location of Camp Cooke), and have a few July days with the trout (George loves to fish), after which he would get home as he came, by working his way back up through the mountain on the various log roads until he reached the main road at Elkins, whence he could read his title clear to an orthodox and quick trip home. We had lunch on the bank under the trees, after which a wagon was procured from the village and the canoes and camp duffle hauled to the freight station, where all of the camp outfit was boxed and shipped separately. We find that it pays to box everything separately that will go in a box, and send the canoes as absolutely light and empty as possible, for we never escape paying four times first-class rates, actual weight, on the canoes, and it is poor economy to leave a couple of hundred pounds or so of camp duffle in a canoe to make it weigh that much more, when the same stuff can be sent at one-fourth the rate when boxed separately.

Roncverte is essentially a railroad and lumber town, and although quite an important business point from a railroad standpoint, we did not find much in it to interest us, as we idled around the little place for the rest of the afternoon and evening, after we had secured a room at the hotel and indulged in the luxury of a shave, a clean flannel outing shirt, and respectable garments. Polk Miller, the delineator of negro characters, with his inimitable quartette of plantation darkey singers, chanced to be there that evening, and helped us to pass the evening in a pleasant and entertaining manner, and the next morning found us on our respective trains, each homeward bound in his own way.

### III.—EPILOGUE.

As a cruising stream, the Greenbrier is a distinct and pronounced success, combining all the good qualities a

cruising stream should have—good swift water, plenty of rapids, which, while sufficiently rough to be exciting, are not dangerous; beautiful and picturesque mountain scenery; a genial, healthful climate, free from malaria and mosquitoes, and good bass fishing withal. We were delighted with the success of our experiment, and our only regret was that I did not have a week more at my disposal, so that we could lie by a couple of days for the bad water to run off, and then continue the cruise to Hinton, where the Greenbrier unites with the New River. There is some rough water scattered around in the recesses of the "big bend," not far above Hinton, and the bass fishing is said to be unusually good in this remote region. These points will make it attractive to both me and George, and it is quite likely that next year will find us again gliding over its mirror-like reaches, slipping over its glassy shallows, and shooting swiftly down its rock-strewn rapids in our canoes.

## CANOEING NEWS NOTES.

### Shattemuc Yacht and Canoe Club.

The annual meeting of the Shattemuc Yacht and Canoe Club was held at the club house on March 3, Vice-Commodore Gilbert M. Todd presiding. The following officers were elected: Com., Franklin Brandreth; Vice-Com., Gilbert M. Todd; Rear-Com., Edward B. Sherwood; Sec'y, William E. Barlow; Treas., William M. Carpenter; Meas., Roger M. Haddock; Trustees, three years, Edward B. Sherwood, Edwin L. Todd. Governing Committee—J. Herbert Carpenter, chairman; Gilbert M. Todd, William I. Townsend, T. Henry Calam, Albert R. Genet. Committee on Admission—Franklin Brandreth, chairman; William I. Townsend, Edwin L. Todd, T. Henry Calam, Remsen W. Nourse. House Committee—James Bedell, chairman; Roger M. Haddock, S. Olin Washburne, A. Fred Carpenter, J. E. Huber. Regatta Committee—William M. Carpenter, chairman; William E. Barlow, Robert T. Dennis. Auditing Committee—William C. Kipp, chairman; T. Henry Calam, Milton C. Palmer.

## The Indra Log.

The Story of a Cruise from Marblehead, Mass., to Sydney, N. B.

BY HENRY G. PICKERING, BOSTON, MASS.

To the yachtsman pure and simple, to the tired brain worker who has never even guessed its stimulating and recuperative power, and to the mere sentimental idler, be he yachtsman or no, a cruise on summer seas offers alike and in turn the eager sport, the rest and the lazy indulgence so welcome to their several desires and so essential to their individual needs.

There is enough of active responsibility and delightful freedom to satisfy the sailor's keenest longings, and enough of absolute do-nothingness, if he so elects, with an enforced separation from life's more insistent demands, to force the thoughts of the over-tired into new and restful channels; and for each and all the three, there is the strange and stirring companionship of the sea, so compelling and absorbing that the voyager is by turns and despite himself sailor, idler, philosopher, and dreamer as the changing moods of sea and wind and sky shall determine, and all to his lasting contentment and well being. This, by way of philosophic prologue to the reader, whether he shall be on sport or health or simple pleasure bent, or even none of these, but only one who loves to hear of ventures by land and sea, albeit he shares them only in the spirit that makes all good and happy things our own.

The coast of Maine has long and deservedly been the favorite sailing domain of Atlantic yachtsmen. In itself an unusually beautiful and interesting shore, and with safe and easy harbors at convenient intervals, it offers perhaps greater inducements for the short cruise than can be found in any other of our eastern waters. For while the summer resorts in almost every cove and inlet invite to pleasant idling, the uncertainty of its weather conditions supplies that element of excitement and not infrequent danger which makes, in large part, the charm of yachting life.

Beyond Bar Harbor, however, or at farthest Campobello Island, it is unusual to find the New York or New England yacht. There seems to be a feeling of vague apprehension, or it may be a lack of the sailor's imagination, in regard to the coast east and north of these points. To show, if possible, that this apprehension is unfounded, and to stimulate without quite satisfying a healthy curiosity, this story of a sailing cruise to the farther East has been written, with natural hesitation and some misgiving. It is told in the form of the yacht's log, as actually kept from day to day; and if the incidents seem trivial and scarcely worthy the recording, it must be remembered that the life at sea is one of but slightly varied routine, and the shore experiences brief and devoted, for the most part, to

our single pursuit of fishing. But with all its sameness—and there is a certain charm perhaps in all pleasant routine—it has been to us who shared it a record of delightful days to be long remembered and, if it may be, shared with others who shall read the simple story.

It is a far cry—700 miles by the coast, as we made it, from Marblehead to Sydney, Cape Breton. We were fifty-four days from anchorage to anchorage; but yachts do not sail as the crow flies, and tides and weather, though we had our share of good luck, are not always propitious.

The Indra, Eastern Y. C., is a schooner yacht, built in 1901, by George Lawley & Son, of South Boston, painted white, measuring 46ft. on the waterline, and 72ft. over all, 15ft. beam, with 16 tons of lead outside on the keel, and drawing 10½ft. of water. Capable of eleven knots an hour in fair wind, of quick action in answering the helm, with a flush deck and ample standing room, she is easily handled in any weather and is an unusually dry boat, standing well up to her work and holding her own without trouble in the heavy tide-rips of the lower Maine and Nova Scotia coasts. Below, she is roomy and thoroughly comfortable, having a large galley with men's quarters forward, good cabin with plenty of headroom and wide transoms, owner's stateroom at the foot of the companionway amidships, and guests' stateroom with two bunks aft; convenient cupboards and lockers, set bowls for washing in staterooms and lavatory, good sanitary equipment, and the entire boat well ventilated, clean, and wholesome. The sail plan comprises the usual equipment of a schooner-rigged yacht, with a storm trysail for emergencies; the two boats are the "dinghy" and the "gig," both bright boats, that is, of the natural wood varnish. The finish of the yacht is mahogany, and the fittings of brass, kept brightly polished at all times, weather permitting. The ship's company were the owner and three guests aft, with a crew of three and a steward forward; so we were full handed for the voyage.

It is a Sunday morning, June 28, bright and clear when we leave our anchorage opposite the Eastern Y. C. in Marblehead Harbor; wind light from southwest; with all sails set and drawing well; down the Beverly and Manchester coast, past Eastern Point, where we dip the ensign to the American and Canadian flags, flying at our good friend K's, on the shore, and Thatcher's twin lights are in line at 11:45. We take in the jib topsail and set the spinnaker, the breeze freshens, and at 4 o'clock we make Portsmouth Harbor and come to anchor behind Kittery Point. A day of fine sailing, clear skies, and sparkling water, most favorable of send-offs for the long voyage before us.

It is an early start next morning, 4:30; and laggards must be astir! The wind is light and little of it before noon; but the tide is with us and the breeze freshens later, giving a fair run to Wood Island, where we ground lightly on the muddy bottom as we come to

anchor, but swinging clear during the evening with the turn of the tide.

Tuesday, the 30th, and another early start at 5. A strenuous beginning, do you say? Well, try it some day, good reader, whether yachtsman or no, and draw the fine crisp air from over the water into your lungs and the sparkle and pure delight of the morning into your heart. To-day the wind is shifting from northeast to southwest, and at noon we set the spinnaker, most helpful of sails before the wind, off Cape Elizabeth, Portland Harbor, and carry it the rest of the day. We make Port Clyde (Herring Gut), at 6:15, and come to anchor for the night.

The morning brings our first fog and very light wind, but growing stronger from the southwest about noon. A good run to Madochawando Bay, opposite Castine, at 4:45. Here is a cozy harbor and good shelter, with a warm welcome from the household of our shipmate H., at his summer home. At the landing stage lies an old schooner, a peaceful "Temeraire" tugged here to its last moorings, the sea-moss deep on its weather-beaten sides, and vines and flowers running riot over its crumbling deck. Across this and climb the steep bank and everywhere are fine reaches of sea and shore, and our host's piazza and hospitality so inviting that we are fain to stay over a day, despite fair winds for eastward sailing.

But July 3 we are off again at 8 A. M., with a fine, strong breeze from the northwest, and makes the North Haven anchorage in Fox Island Thoroughfare, at 10:50. Here is more cordial hospitality from friends ashore, and Independence Day, to-morrow, to be duly celebrated on American soil. Surely we must stay over, as in patriotic duty bound, even though we lose our last fair wind thereby. Then there are sundry and various things to be done; we have determined to leave behind us our spinnaker and fore topmast, making a snug rigging for unknown conditions on a new coast; mail must be got and sent; and water and supplies taken on board.

July 4, the morning breaks fine. All are up bright and early and dress ship, in honor of the day. The "Thoroughfare" is wide awake this morning, flags are out everywhere, and there is much bustle and preparation for the regatta—two races for the knockabouts and small cats being in order, and great rivalry among the young owners and skippers thereof. All this we watch comfortably with our guests from our own deck, and therefore return visits with tea drinking and hearty welcome ashore.

Another fine morning on the 5th, but wind light from the east. The Columbia, Commodore L., of Yarmouth, N. S., anchored near by, is off before us, bound for St. John, to the races. A busy forenoon, lightening fresh water for our three tanks from the shore in one of our own boats, filled as deep as she will float, taking down the fore topmast and storing it with

the spinnaker boom anent our return to these waters with our god friend R., whose house is always open to wayfarers and "Thoroughfarers," and at 1 are under way again with a fair west wind headed east. At 4 o'clock we are at the westerly entrance to Casco Passage. Watch the buoys and keep the red ones to port! "Aye, aye," from the writer at the wheel. "Shoaling ahead, sir," comes from forward. "Helm hard over." "Too late! we are fast, grounding on the Long Ledge," and Uncle Sam to blame for it. A black buoy after all, but defaced beyond recognition and of rusty red at the waterline. Memo.—See the Department about this and urge their copying our Dominion neighbors in distinguishing port from starboard buoys by the shape and not by the color only; this applying to spar buoys alone, the "cans" being already so marked. Luckily we have touched lightly, and we get out an anchor and

A Fisherman.

haul off, the tide helping us, within the hour; and at 6:15 are safely anchored in Bass Harbor.

A 5:30 start in the morning, but the light wind fails, and we drop anchor again to avoid going ashore with the tide. A fresh start in light rain and almost no wind, so we run in between Cranberry and Sutton Island and lunched. At 1, we get a fair breeze, which lasts us to Schoodic, but it falls again and the fog sets in as we pass Petit Manan. Such are the vagaries of sailing, and we are yet to see more of them in the near future. Cape Split anchorage is fortunately comfortable enough in any weather, and we run in here for the night.

With the morning the fog is driving heavily in before a southeast wind, and neither this day nor next do we tempt adverse fortune. There is rain, too, and continued fog in the offing, rising a little from time to time, but settling again, and what wind there is is against us; so we go ashore to the little town of South Addison, where we meet Mr. C., late first mate of the W. B. Thomas, a fine five master lost on her first voy-

"Dress-ship in honor of the day."

age, and hear the distressing story of the wreck. We had sighted the vessel on the rocks the day before. Again on board, we turn to rainy day occupations, labeling charts and doing odds and ends about ship. Then another trip ashore for newspapers and whatever may fall in our way to lighten a dull day.

There is rain again in the early morning and fog outside, as before, but clearing weather later and hope for a marked change with the full moon to-night. But the next morning comes with no wind, and the ebb tide running westwardly through the "Reach" against us. It is late before we get under way with a light breeze, and at 10 in the evening run into Jonesport. Here the yacht is to be docked for inspection of the hull, and next morning she is brought alongside the wharf, tackle from the upper masts made fast ashore to hold her upright when the tide goes out, and at low water, about 5 o'clock, a careful examination is made. No injury is found, and at 10 in the evening we warp and tow her out again to the anchorage. We have beguiled the hours while waiting for the ebb, by visiting the great sardine-packing factory, an admirable plant, with a capacity of handling and preparing some seven tons a day.

July 11, fog again, an old friend by this time, clearing inside to blue sky later, but the same heavy curtain further out, and no sign of lifting. The Captain and I go ashore with vast preparation for a reputed trout stream in the interior, returning in the evening wet to the skin from a smart shower, but having depopulated Indian River to the extent of half a dozen fingerlings, and a couple of their unwary brethren of large growth, pronounced by admiring natives a "more than average"

catch, especially as taken with the fly. The arrival of the Frank Jones in the evening, Jonesport being now her eastern terminus, is a pretty sight, as she threads her way in picking up buoys and vessels at anchor with her sweeping searchlight. These daily steamers run on schedule time, making no allowance for fog or darkness, but reckoning distances by revolutions of the propeller and using the searchlight with effect in difficult places or in making port. The derided trout look larger in the pan at breakfast, and are of excellent flavor, so we retract our comments of the day before.

We are off next morning at 9 o'clock with a light southwest wind, and shortly after pick up a derelict ship's boat, floating bottom upward, but in good condition. She is righted, bailed, and towing astern inside of twenty minutes, and is awarded as "lawful prize" to the salvors, who promptly sell her to a fisherman at the next port. Seal Harbor, Grand Manan, at 4:15, the anchorage an exposed one from the south, but the wind which has increased during the day falls again at sundown, and we have a quiet night.

Next day, no wind. We go ashore and drive twelve miles to North Head, on a fine, broad cove with Swallowtail light at its easterly end. The great cliffs to the north, which we see from Whale Cove, are particularly fine, but are best seen, of course, in rounding the island from the other side. The fog is dense on our return and continuing with no wind through the following day.

[TO BE CONTINUED.]

## White Bear Y. C.

IN the early part of February Messrs. Lucius P. Ordway and Homer P. Clark, of the White Bear Y. C., met in New York to consider the designs submitted for trial boats for the Seawanhaka cup, and decide which of the boats should be built. Plans had been submitted by the following:

Mr. B. B. Crowninshield, Boston, Mass.

A Topsail Schooner.

Mr. F. D. Lawley, South Boston, Mass.  
Messrs. Burgess & Packard, Boston, Mass.  
Mr. Charles D. Mower, New York City.  
Mr. Gus Amundson, St. Paul, Minn.  
Mr. Andrew Peterson, Minnetonka, Minn.  
Messrs. Jones & LaBorde, Oshkosh, Minn.  
Mr. C. M. Palmer, Highland Park, Ill.

Out of the eight designs submitted four were selected. Mr. C. D. Mower sent in a design for a sharp-bowed boat of the Duggan type that impressed the committee favorably, and this boat will be built by Amundson.

Messrs. Jones & LaBorde's design showed an improved Tecumseh, and she will be built by themselves.

Mr. Gus Amundson sent in a design that was similar to his successful Minnesota, and a boat will be built by himself from these plans.

Mr. J. Johnson, of White Bear Lake, will build the fourth boat. She will be similar to Massasoit.

All the above boats will be built at once, and will be put overboard as soon as the weather permits. After fully trying out the boats at White Bear Lake, the most successful will be taken to Oshkosh, and they will race there on Lake Winnebago.

We publish in full the matter sent out by Mr. Ordway, as it contains much of interest and value:

The Royal St. Lawrence Y. C., of Montreal, Canada, having accepted the challenge of the White Bear Y. C., of St. Paul, Minn., for the Seawanhaka international challenge cup for small yachts, and the conditions governing the match having been arranged, the White Bear Y. C. can now announce both these conditions and the plan which it proposes to follow in its effort to wrest the cup from its present holders.

The White Bear Y. C. realizes the responsibility of its position and the difficulty of lifting this cup, which seems to be a fixture at Montreal. This country has attempted to bring back the cup on various theories, and four different yacht clubs have handled the problem, only to be successively beaten. Our experience and study of the problem show us that a wide-open, loose policy cannot win the cup as long as either Mr. Duggan or Mr. Shearwood manages the defense. We know that, in order to win, we must concentrate our efforts along certain lines, and put the management into competent hands, following methods so successfully used by the defenders. Our opponents in this race are wonderfully expert, not only in designing, but in building, rigging, and tuning up their boats, their committee having absolute control of the selection and sailing of same, and the solid backing of their club and country.

In view of the above conditions, a plan of concentration has been decided upon, and the entire management of all matters pertaining to the selection of the challenger and the races at Montreal have been placed in the hands of a special racing committee of seven, of which ex-Com. L. P. Ordway is chairman. This committee has secured and is studying the designs of a number of the best small boat builders in this country, and will build for the members of the White Bear Y. C. as a syndicate four boats, thus concentrating the problems of designing and construction, including sail plan, rigging, etc. When the time comes for tuning up the boats, the committee hopes to place from two to four crews in the field, whose experience is sufficient to stand the most severe test of seamanship. Both crews and yachts will be under the supervision and management of a sub-committee of two—probably the chairman and ex-Com. C. M. Griggs.

In order to avoid any misunderstanding, we have decided to expose our method of attack, as above stated, that our sister

clubs of this country may know just how we view the situation. We want the help of your club, if you have confidence enough in us to sail under our colors and in accordance with the above plan of management. If your loyalty to country is sufficient to prompt you to lend us your aid and warrant your building and sending to our committee a boat to be tried out against local and outside boats which may be entered in such preliminary races as our committee may order (you guaranteeing to us possession of the boat from the beginning of the preliminary trial races, until after the races for the cup at Montreal, providing the committee wishes to keep it that long) then we will be glad to accept your aid, and will guarantee to take reasonable care of your boat and to give her a fair and thorough test. The same conditions are imposed upon members of our club entering boats as are imposed upon members of other clubs, and the members of the special racing committee are prohibited from owning an interest in any individual competing boat.

We cannot proceed with any confidence along other lines than the above. Three years ago we made the attempt to hold an

Indra.

open regatta, with the result that not a single outside boat was sent to the trial races.

### METHOD OF PROCEDURE FOR SELECTION OF THE CHALLENGER.

The committee will race in pairs, by such crews as it may select, the boats which are presented to it for trial. It will probably sail several series of races on the Bagnall-Wyld system of drawing—racing down to a single winner. This is a process of elimination, the loser dropping out, and the winners only continuing. The above method has the advantage of reducing to a minimum the chances of fouls and the chance of a boat's losing races by flukes; and if continued long enough to embrace all kinds of weather, will, we firmly believe, result in demonstrating which is the best all-around boat. A suitable trophy will be presented to the winner of each series.

The preliminary trial races will commence on Monday, June 13, and any outside boat entered can be sailed during that week by such crew as the owner may present, with the understanding and agreement that if desired by the committee, the boat shall be

Yarmouth.

left in their charge and possession for further trials and use at Montreal—if selected for such honor.

Instructions as to contestants, courses, marks, signals, starting, numbers, and all matters pertaining to the race for the day, will be posted by the committee in charge on the bulletin board at the White Bear Y. C. house at 9 A. M. each morning during the week commencing June 13, 1904.

In the event that any outside boat is retained by the committee for further trial races at White Bear Lake, or to go to Montreal, the White Bear Y. C. guarantees to pay the transportation charges to Montreal and from thence to the home waters of such boat.

At the request and upon the responsibility of any club entering a yacht with the committee for the trial races, the privileges of the club house of the White Bear Y. C. will be extended to the owner and amateur crew of the yacht so entered during the period occupied by such races, and upon the same terms as to members of the club.

Entries and correspondence may be addressed to the chairman of the committee, Lucius P. Ordway, at 248 E. Fourth street, St. Paul, Minn.

Conditions governing race between the Royal St. Lawrence Y. C., of Montreal, and the White Bear Y. C., of St. Paul, Minn., for the Seawanhaka International challenge cup, to be sailed beginning Aug. 4, 1904.

### AGREEMENT

Covering the special conditions of the match for the Seawanhaka international challenge cup for small yachts, to be sailed by the representative yachts of the Royal St. Lawrence Y. C., Montreal, Canada, and the White Bear Y. C., of St. Paul, Minn., U. S. A., during the yachting season of 1904.

In pursuance of the provisions of Article XI. of the Declaration of Trust, executed by the Seawanhaka Corinthian Y. C., dated the 1st day of June, 1896, and containing the terms and conditions governing the tenure of the Seawanhaka challenge cup, it is hereby agreed between the Royal St. Lawrence Y. C. and the White Bear Y. C., of St. Paul, Minn., that the following special terms and conditions shall govern the match to be sailed on the waters of Lake St. Louis during the yachting season of 1904.

### EXPLANATION OF TERMS.

Article 1.—The following expressions have the meanings assigned to them in this section unless the context requires otherwise:

(a) "The Match" means the races to be sailed for the cup.

- (b) "The Trust" means the Declaration of Trust.  
 (c) "The challenged yacht," "the challenging yacht," "the yachts," "the competitors," "competitor," mean the yachts representing the Royal St. Lawrence Y. C. and the White Bear Y. C., respectively.  
 (d) "Centerboard" includes plates and sliding keels as mentioned in Article VI. of the Trust, and permits of the use of more than one on either side.  
 (e) "The crew" includes the helmsman.  
 (f) "The mark" means a mark used to indicate the course, as provided for in Article 25.

#### THE MATCH.

Article 2.—The match shall be awarded to the yacht winning three of five races. Each race shall be of a total length of twelve nautical miles, as measured by the log.

#### NOMINATION OF YACHTS.

Article 3.—Each club shall name its representative yacht at least five days before the first race. Any protest as to the eligibility of either competitor must be made at least three days before the first race.

#### THE JUDGES.

Article 4.—The challenging and challenged clubs shall each nominate a person and secure his consent to act as a judge. Notice of such nomination and consent shall be given by each club to the other on or before the first day of June, 1904. This notice shall be forthwith communicated by such other club to its nominee.

Article 5.—The two judges so appointed shall elect a third judge on or before the first day of July, 1904.  
 Article 6.—The third judge shall act as convener and chairman of the judges and shall forthwith notify the two clubs of his own appointment.

Article 7.—In the event of the judges so nominated by the clubs, or either of them, subsequently refusing, or being for any cause unable to act, the nominating club shall immediately make a new nomination and give notice thereof.

For like reason and in like manner a new selection of a third judge shall be made and notified to the clubs.

Article 8.—Subject to the provisions of the Trust and of this Agreement, the judges shall—

- Verify and decide whether the competitors come in all respects within the prescribed conditions.
- Lay out the courses.
- Order in what direction the course for the day shall be sailed.
- Postpone a start in the event of a fog or calm; or of a competitor becoming injured or disabled, as provided in Articles 26 and 27.
- Generally manage the races and decide all questions and disputes in relation thereto.
- Act as timekeepers and declare the results.
- The decision of the judges shall be final.

#### THE YACHTS—RACING LENGTH OR SIZE—MEASUREMENTS.

Article 9.—Competitors must not exceed 500 feet sail area, and must not exceed 25 feet limit of racing length under the following rules:

Load waterline plus square root of sail area divided by 2, equals racing length.

Article 10.—The factor of load waterline used in determining racing length shall be ascertained, with 450 pounds dead weight placed substantially amidships in lieu of crew when the yachts are in racing trim.

The factor of sail area used in determining racing length shall be ascertained by adding to the actual area of the mainsail the area of the fore triangle.

The hoist and outer points of the mainsail, when measured, shall be marked respectively on the mast, boom, and gaff, or other spars used to set the sail.

The factor of fore triangle, used in determining sail area, shall be ascertained from the perpendicular distance between the deck and the point on the forestay where the line of the leach of the jib intersects the forestay, and the base distance between the forward side of the mast, and the point of intersection of the forestay or line of jib luff with the bowsprit or hull.

The said point of intersection of the forestay shall be marked thereon.

#### THE YACHTS—DRAFT.

Article 11.—Draft shall be determined when the competitors are in trim for measurement.

Article 12.—A competitor's draft of hull or fixed keel shall not exceed 5 feet, and with the centerboards down shall not exceed 6 feet.

Article 13.—Yachts shall be constructed in accordance with the following restrictions:

- On a cross section taken at any point no part of the hull shall be appreciably below the center part of the hull exclusive of the false keel or skeg.
- The area of the cockpit shall not exceed 30 per cent. of the total area of the deck.
- The planking of hull shall not be less than  $\frac{1}{2}$  inch thick at any point.
- The frames or ribs shall be of oak, elm or other hard wood, and shall not be less than  $1\frac{1}{4}$  square inches per lineal foot of length; they may, however, be spaced as desired.  
 Example frames may be  $1\frac{1}{4}$  by 1 inch, spaced 12 inches c. to c., or  $\frac{5}{8}$  by 1 inch, spaced 6 inches c. to c., or  $\frac{3}{4}$  by  $\frac{3}{4}$  inch, spaced  $2\frac{1}{4}$  inches c. to c. Internal bracing, floors, knees, or other stiffening members shall not be included in the area of the frames or deck beams.
- The deck planks shall not be less than  $\frac{1}{2}$  inch thick, if without covering; but where covered with canvas may be  $\frac{3}{8}$  inch thick. The deck beams shall not be less than  $1\frac{1}{4}$  square inches per lineal foot of length. Example: deck beams may be  $1\frac{1}{2}$  by 1 inch, spaced 12 inches c. to c., or  $1\frac{1}{2}$  by  $\frac{1}{2}$  inch, spaced 6 inches c. to c.

Article 14.—Centerboards shall be so constructed that they can be wholly housed without leaving any protection below the keel or hull.

They shall not be loaded except to overcome flotation; but metal plates may be used under the following restrictions:

If of steel or iron plate, they shall be of practically uniform thickness, and shall not weigh, either singly or collectively, over 350 pounds.

No hollow boards shall be allowed.

If of bronze, brass, or any metal other than steel or iron, they shall be of practically uniform thickness, and not weigh, either singly or collectively, over 300 pounds.

(For draft of centerboards, see Article 12.)

#### THE YACHTS—SAILS.

Article 15.—Sails shall be limited to mainsails, jibs and spinnakers.

All jibs and spinnakers must be triangular sails, but each may have a small club on the head not exceeding 5 per cent. of the base of the fore triangle.

The total area of the mainsail and fore triangle shall not exceed 500 square feet.

The total area of the spinnaker, measured as a triangle, the base of which is the length of the spinnaker boom measured from its outer end, when set to the center of the mast, and whose perpendicular is the distance from the deck at the foreside of the mast to the spinnaker halliard block, shall not exceed twice the area of the fore triangle.

Article 16.—The mainsail, when set, must not be set beyond the hoist and outer points marked on the mast, boom, gaff or other spars, as directed by Article 10.

Any jib, when set, shall not extend beyond the upper and forward points defined in Article 10.

The spinnaker boom, when used in carrying sail, shall not be lashed to prevent its lifting, neither shall any cleats, rests or other devices be fixed on deck to aid in any manner the carrying of this sail; the after guy shall be the only guy used, and this may not be connected in any way to the hull at a point forward of the main shrouds.

#### THE YACHTS—BALLAST.

Article 17.—Shifting ballast shall not be allowed. Centerboards shall be considered as fixed ballast.

Article 18.—No outrigger or other mechanical device for carrying live ballast outboard shall be allowed.

Article 19.—Yachts must sail throughout the match with the same amount of fixed ballast, and with centerboards of practically the same weight as carried in the first race.

#### LIFE PRESERVERS AND ANCHORS.

Article 20.—Two life-preservers shall be carried, and anchors, chains, etc., may or may not be carried, at the option of the contestants. The option must be declared before measurement and for the purposes thereof, and shall be adhered to throughout the races.

#### THE CREW.

Article 21.—The crew shall be amateurs and members of the respective clubs.

Article 22.—The provision of the Trust, Article X., requiring helmsmen to be nominated in writing twenty-four hours before the day appointed for the first race, is waived. In lieu thereof the challenging and challenged clubs shall furnish, each to the other, or to their respective representatives, a certificate in a form of the following tenor:

"It is hereby certified that who are nominated to sail on the representative yacht of this club are amateurs in the spirit of the word, and are members of this club."

Article 23.—The total actual weight of the crew, including all clothes, personal apparel, and belongings, worn by them or carried on board during the race, shall not exceed 650 pounds.

#### THE COURSES.

Article 24.—The courses shall consist of a triangular course and a course to windward and return.

Each leg of the triangular course shall be one and one-third nautical miles in length. The course shall be sailed over three times.

Each leg of the course to windward and return shall, if possible, be two nautical miles, and in any event, not less than one nautical mile.

The course shall be sailed over a sufficient number of times to make a total of twelve nautical miles.

Article 25.—The marks to indicate the courses shall consist of staffs, bearing red and white flags for the triangular course, and black and white for the windward and return course, and they shall be capped with bright tin cones.

Article 26.—A race may be suspended or postponed for such time as the judges deem reasonable to permit of repairs to a competitor disabled or injured before the second signal.

Article 27.—A start may be suspended or postponed to a later hour of the same day, or to the next following day (excluding Sunday), in the event of a fog or a calm.

#### ORDER OF COURSES.

Article 28.—The races shall be sailed alternately over the triangular and the windward and return courses.

The first race to be triangular or windward and return, as the winner of the toss may elect.

#### REGULATIONS FOR START AND FINISH.

Article 29.—The start and finish shall be, respectively, across a line between, and designated by, a mark and a stake boat flying the burgee of the Royal St. Lawrence Y. C.

Article 30.—(a) Windward and return course: For the start and during the race the stakeboat shall be anchored at right angles to the course, so that the competitors shall leave the starting buoy to starboard.  
 (b) Triangular course: For the start and during the race the stakeboat shall be moored outside and at right angles to the first leg.

Article 31.—For the finish the stakeboat shall be moored to a similar position on the other side of the buoy, at right angles to the last leg.

Article 32.—To determine the start and finish, the judges' steamer shall be anchored beyond the stakeboat, with its signal staff, as nearly as practicable, in range with the mast of the stakeboat and the mark, but the true line shall be held to be the prolongation of the range of the signal staff of the judges' steamer and of the flag mast of the stakeboat.

Article 33.—Unless otherwise ordered, marks shall be left to starboard.

Article 34.—If the judges in their discretion order the triangular course to be sailed in the reverse direction, leaving marks to port, the reverse positions of the stakeboats and judges' steamer shall be a notice of such reversal.

#### THE RACES.

Article 35.—The start shall be made, as nearly as practicable, at a quarter past one in the afternoon. The race shall be deemed to have begun when the second signal has been given, except for the calculation of the time limit, under Article 39.

Article 36.—The start shall be a flying start, and the signals therefor shall be as follows:

(a) First Signal—Preliminary.—The blue peter shall be hoisted on the signal staff of the judges' steamer, accompanied by a whistle fifteen seconds long.

There shall be an interval of five minutes between the first and second signals.

(b) Second Signal—Preparatory.—The blue peter on the judges' steamer shall be lowered and a red ball hoisted, accompanied by a whistle fifteen seconds long.

There shall be an interval of five minutes between the second and third signals.

(c) Third Signal—Start.—The red ball shall be lowered, accompanied by the firing of a gun and a whistle fifteen seconds long.

Article 37.—The races shall be sailed without time allowance.

Article 38.—In case it shall be necessary to recall either or both of the competitors, the following signals shall be used:

(a) For the recall of the challenging yacht, a United States ensign shall be hoisted on the signal staff of the judges' steamer, accompanied by two sharp whistles.

(b) For the recall of the challenged yacht, a British ensign shall be hoisted, accompanied by three sharp whistles.

(c) For the recall of both competitors, the burgee of both clubs shall be so hoisted, accompanied by four sharp whistles.

Article 39.—The competitors shall be called off—

(a) If any triangular race is not concluded within three and one-quarter hours after the third or start signal has been given.

(b) If any windward and return race is not concluded within three and one-half hours after the third or start signal has been given.

Article 40.—For calling off a race, the red ball shall be half-masted on the signal staff of the judges' steamer, accompanied by the firing of a gun and a whistle fifteen seconds long.

Article 41.—The match shall be sailed under the rules of the Royal St. Lawrence Y. C., except as modified by this Instrument.

Article 42.—The provisions of the Trust, in so far as the same are inconsistent with the foregoing articles, are hereby waived.

At a meeting of the White Bear Y. C. a special race committee of seven was appointed to have complete charge of the selection of the challenger and the conducting of the race for the Seawanhaka cup.

## Boston Letter.

BOSTON, March 7.—Boston yachtsmen will no doubt become greatly interested in the proposed ocean race for small boats from Boston to New York as the details of the race become more perfected. The spirit of ocean racing has entered into the owners of yachts in the 22ft. class, and there is no doubt that some of these boats may be entered for the event, for which Sir Thomas Lipton has agreed to subscribe a cup. In the regulations drawn up by Mr. Thomas Fleming Day, who has the race in hand, it is specified that the yachts will be limited to 40 feet over all. Only a short time ago the owner of a 35ft. cruiser spoke to me of the race suggested from New York to Boston, and expressed himself as being very desirous of entering such a contest. As his yacht is over 52ft. over all, however, she would be ineligible. The new Massachusetts 30-footers, the Buzzard's Bay 30-footers, and the Bar Harbor 30-footers would also be barred on account of their over all length; and it is quite likely that some of the owners of these yachts would like to enter the contest. It is understood, however, that Mr. Day's regulations are, to a great extent, provisional, and will be changed at the suggestion of those yachtsmen who might desire to enter. If there should be sufficient guarantee of entries there is no doubt that Mr. Day will find some way in which the boats can race. At the

present time it is a little early for complete details, and the opinions of yacht owners will largely govern the contest, if they will only come forward and express their views. In this manner all hands, or a majority of those desiring to race, may be suited.

At the annual meeting of the New Bedford Y. C. the following officers were elected: Com., William F. Williams; Vice-Com., Charles R. Allen; Rear-Com., Joseph C. Nowell; Sec'y, Seth J. Besse; Treas., Horace Wood; Directors—Robert A. Terry, Alfred S. James, Edgar B. Hammond, Benjamin H. Anthony, John I. Paulding, A. R. Pierce, Fred R. Fish, William P. Covell, F. W. Reynolds, Frank B. Sistar, Charles A. Morrison.

Messrs. Murray & Tregurtha are building a high speed launch for a Boston yachtsman who wishes his name withheld for the present. She will be of the torpedo boat type, 35ft. long and 5ft. 3in. beam. Her planking will be  $\frac{3}{8}$ in. cedar, and she will have a turtle-back pine deck 3-16in. thick, covered with canvas. The power will be a Murray & Tregurtha four-cylinder engine of about 15 horse-power. This firm has also sold the 42ft. cabin gasoline launch, Victorine, owned by M. Victor Belanger, to Mr. Albert H. Waitt, of Newton, who will use her in Buzzard's Bay.

At the annual meeting of the Taunton Y. C. the following officers and committees were elected: Com., C. V. Sanders; Vice-Com., Daniel L. Brownell; Rear-Com., Louis J. Schmidt; Sec'y, E. P. Washburn; Treas., E. A. Tetlow; Directors—C. V. Sanders, D. L. Brownell, George E. Wilbur, E. Everett Evans, L. J. Schmidt, Edwin A. Darey, and W. W. Arnold; Regatta Committee—John H. Church, John H. Eldridge, B. Huber, Dr. W. Y. Fox, and Max Boewe; Hose Committee—F. B. Fox, Roland H. Babbitt, and B. F. Morse; Admission Committee—C. E. Godfrey, E. L. Sturgis, William Reed, J. R. Tallman, A. H. Tetlow, and W. K. Hodgman.

At the annual meeting of the Rhode Island Y. C. the following officers and committees were elected: Com., Dr. F. T. Rogers; Vice-Com., Dr. William P. Church; Rear-Com., W. O. Todd; Sec'y and Treas., George E. Darling; Meas., Scott C. Burlingame and H. A. Capron; Directors—Frank P. Eddy, Arthur E. Austin, and John M. Richmond; Race Committee—Frederick S. Nock, Bradbury L. Barnes, Dr. Henry B. Potter, William F. Boone, and Charles H. Mathewson; Committee on Admissions—E. L. Fuller, E. M. Clark, Gustavus Taylor, H. A. Munroe, N. B. Horton, H. B. Wright, G. R. Alexander, Percy A. Harden, and A. T. Vigneron; House Committee, W. W. Bloomer, A. L. Young, and H. B. Wright; Potters Cove Committee—F. L. Davenport, George E. Darling, and John Schleicher; Social Committee—S. C. Burlingame, F. A. Barnes, Charles G. Easton, Miles A. Carter, and Percy A. Harden; Delegates to Narragansett Bay Y. R. A.—B. L. Barnes, F. S. Nock, and S. C. Burlingame.

Fitting out time will soon be here, and it is not expected that many more new boats will be ordered, especially in the racing classes. At Lawley's the 18-footer designed by Mr. E. A. Boardman for the one-design class for Mr. C. H. W. Foster, has been finished. The 22-footer designed by Mr. Fred D. Lawley for Mr. S. C. Winsor is planked.

Mr. W. J. J. Young, who drew the lines for the steam yacht Pantooet, has designed a 34ft. waterline schooner for Dr. L. R. G. Crandon, of the Boston Y. C. She will be built by Edwards, of City Point.

JOHN B. KILLEEN.

## Interlake Yachting Letter.

CLEVELAND, Ohio, March 6.—Another boat has been located for the 21ft. restricted class, formerly known as the 21ft. class of the Country Club, of Detroit, but more recently the 21ft. restricted special class of the Interlake Y. A. She will be built for Mr. H. T. Schmidt, of the Detroit Y. C., and in design is similar to Little Shamrock, of Chicago. While Little Shamrock was never very much admired on fresh water, the general type has been closely followed in the new class of the Country Club. Mr. Schmidt's boat was designed by Mr. Parker, of Marine City, Michigan, and has the earmarks of a good all round boat. While I should not say that she is a machine, as there is nothing of the freak about her, she has the appearance of a speedy little craft, that will do good work in most kinds of weather. The contract calls for her delivery April 15, which will give her owner an abundance of time to get her in shape for the season's racing. The latest 21-footer is designed right up to the limit of the class, so far as general dimensions are concerned, and she also has the limit of sail area. Dimensions are: Over all, 36ft.; waterline, 21ft.; breadth, 10ft. 4in.; with a sail area of 949 sq. ft. Mr. Schmidt has great confidence in his designer, and hopes to land the Walker trophy. If the boat makes a creditable showing in her trials, she will be shipped to Chicago to compete for the Lipton trophy.

Rear-Commodore Lloyd, of the Detroit Boat Club Yachtsmen, is having a boat built for the 16ft. restricted class, which was recently adopted by the aforementioned club. More than the ordinary amount of confidence is being placed in this class, and it is probable that by the close of another season it will be one of the most popular. There seems to be a strong tendency toward the small boat on fresh water just at present. What the cause is, cannot be determined just at present, unless it is that the sailors have become infatuated with the broad, shallow type of boat. Heretofore, keel boats have predominated, and few, if any, wanted anything other than large craft. But since the advent of the 21ft. class, yachtsmen have been drifting into smaller classes.

At a recent meeting of the Inter Lake Y. A., the 21ft. class was formally adopted by the association. At this meeting the question of professionalism was thoroughly discussed, and it was decided to reinstate professionals to the ranks of the Corinthianism, after a period of two years, provided sufficient proof could be given that no races had been sailed for any recompense whatsoever during the interim. There are a number of yachtsmen on Lake Erie, at present, under the ban of professionalism, who are more Corinthians than those who have not been afflicted with a like restriction. The date of the annual regatta of the association was de-

37-FOOT SPEED LAUNCH—DESIGNED BY STEARNS & MCKAY FOR LAWRENCE PERCIVAL AND BUILT BY THE MARBLEHEAD YACHT YARD.

### 37ft. Foot Speed Launch.

THE design for a high speed launch that appears in this issue was made by Mr. W. B. Stearns, of Messrs. Stearns & McKay, Marblehead, Mass., and is building at the Marblehead Yacht Yard. The boat is for Mr. Lawrence Percival, the well known Boston yachtsman.

Her dimensions are as follows:

Length—	
Over all .....	37ft. 3in.
L.W.L. ....	34ft. 5in.
Overhang—	
Forward .....	1ft. 5in.
Aft .....	1ft. 5in.
Breadth—	
Extreme .....	4ft. 8in.
L.W.L. ....	4ft. 4in.
Draft—	
Extreme .....	1ft. 9in.
Freeboard—	
Forward .....	2ft. 10in.
Aft .....	1ft. 8in.

The design is along the lines of the Dolphin type, but with such modifications as it is hoped will result in making the boat sufficiently seaworthy to stand the weather which an ordinary launch of this size ought to be able to go through. In place of the square bilges and sharp corners at the waterline, we have materially softened the bilges and introduced as much flare as possible. The stern has been cut off diagonally, after the French practice. The construction is rather novel, but it is hoped will result in absolute water tightness, great strength, and a degree of lightness which is seldom attained in substantial construction.

The engine is a four-cylinder machine which will develop 25 horse-power on 1,000 revolutions. In ordinary work a reversible propeller will be used to save the weight of the reversing gear, and also to secure the stiffness of shaft given by the reversing sleeve. If this arrangement proves satisfactory, it will be used on all occasions; but if, after trial, it is found that a solid propeller gives better results, the reversible one will not be used for racing.

It is against the policy of the designers to give out what speed they expect the boat to attain, but from what we have learned we are confident that she ought to beat any power boat of her size in Eastern waters.

### Gas Engines and Launches.

BY F. K. GRAIN.

(Continued from page 195.)

#### Cylinder Head.

WE now come to the cylinder head. There is not so very much we can say about this part of the engine, excepting that the usual practice, and, in fact, the only correct method, is to make this part of the engine hollow for a water jacket. We then keep the head perfectly cool, preventing heating of the electrode if placed through the head, and eliminate entirely the old defects of the solid head which was to become so over-heated that it would ignite the gas. The water should circulate from the cylin-

der jacket to these heads through a number of small narrow passages; by this means the packing in the cylinder head is not cut away to excess, and if at least six bolts of proper dimension are used in fastening on the head there will be very little chance of leakage in the packing.

#### Exhaust and Inlet Ports.

The exhaust and inlet ports of the cylinder should be very carefully proportioned; and, in fact, there is a rule now universally adopted which does away with all element of guess work and uncertainty in their design and construction. The lower we can place the exhaust port the more we benefit from the expansion of gas. But it is a safe rule to insist that the exhaust port should be uncovered three-fourths on the down stroke before the opening of the inlet ports.

This timing will produce good clear impulses, thoroughly discharge the old gases before the new gas enters, and on this basis it will be very seldom that the in-rushing gas will be ignited, causing back-firing, which we will speak of later on. Personally we are great believers in making the ports amply large—larger even than the rules call for, as we know we are then on the safe side. The inlet port should, if possible, be so situated that the gas entering from it will be deflected directly into the electrode and sparking mechanism, as this tends to keep the latter cool and clean. In some engines the exhaust is relatively to the inlet port on the quarter. We think, however, this is bad practice, and that the latter should be directly opposite; in other words, as far away as possible.

#### Water Jackets.

Water jackets surrounding the cylinder are universally employed on all successful engines, excepting the very small engines for bicycle use. The object of the water jacket is to maintain the cylinder at an even temperature without over-heating. If the cylinder was run perfectly hot the expansion of the metals would be such that the engine would soon stick, or freeze, as it is termed; not only this, but the high temperature would consume the lubricating oils. To get the best results the temperature of the water in the jacket should be as near 180 degrees as possible, but in the marine engine little attention is ever given to this. As long as the engine keeps reasonably cool and continues to work well, the average owner is willing to let things alone. A number of engines have been failures owing to insufficient water jacketing, and there are others which have had too much water jacketing. The first means that the engines do not work at all; the latter that we do not get the full expansion and are wasting gasoline; naturally, therefore, we lean to the excess rather than to the reverse on this question.

#### Bearings.

WE will now go back to the bottom of the engine, and we come to the bearings of the crank shaft. These, in the two-cycle engine, are, with but very few exceptions, made of either bronze or cast iron. The bronze bearing is that most universally used, although a cast iron bearing is used on many of the prominent engines. The cast iron bearing should, however, be carefully looked after while

cided and set for July 17 to 23. Minx, one of the largest sailing yachts on fresh water, will be partially rebuilt by Mr. Joe Poulliot, at Detroit. She will also have new decks and an entire new suit of canvas. Minx is owned by Mr. William Murray, of Detroit, and has a ketch rig.

A new class of one-design catboats are being built for the Monroe Y. C., of Monroe, Michigan. Six boats are to be built in time for use next season. The club experimented with two of these little craft last season, and were so well pleased with them, that it was decided to have a later design made, and build from six to a dozen boats, and at the last meeting of the club, the six above mentioned were ordered.

The Detroit Boat Club Yachtsmen have also decided to add two more boats to their one-design class, and they have been ordered.

Mr. Frank Donahue, of Sandusky, is having a new boat built. Mr. Donahue formerly owned Eva, one of the fastest 30-footers ever built. Eva was famous over the entire chain of lakes, as the greatest windward boat afloat. She was also a marvel of speed in light airs, and while Mr. Donahue is very reticent about his new boat, yachtsmen are taking it for granted that when she makes her appearance, she will indeed be a flyer.

Cleveland is moving lively now, with a number of new boats building, and several nearly completed. The 18-footer, building for Messrs. Watterson and Hershing, at Maltby's, is just about completed, and will be in the water with the breaking of the ice. Dr. N. W. Brown's new yawl is ready for launching. Result, one of the largest of the L. Y. C., will have new spars, rigging and canvas before being placed in commission, and will be raced again next summer. Restless is being rebuilt preparatory to a season's racing. While apparently in good shape, her owners would take no chances till after rebuilding. Mona will be lengthened. The work will necessitate great care, and is a difficult piece of work. The idea is to cut her through amidships, and to build from the center. The owners are of the opinion that the craft has too much beam for her over all length. Orinda will have new canvas, which will be made by Messrs. Carpenter & Co., of Chicago. Mischief, one of the trimmest little boats of the fleet, which was rebuilt some two years ago, and was at the time fitted with a jib and mainsail in place of the cutter rig which she formerly carried, is to return to the cutter rig. Her owner stated a few days ago that the two-piece rig had never been successful, and that he was going to have an entire new suit of sails made. Sweetheart, the big schooner yacht, formerly owned by Mr. W. R. White, has been sold to Mr. Jontzen, who will convert her into an auxiliary. Whim will be given new covering boards, and a suit of canvas. Meteor is another of the fleet that has recently changed hands, and will be used by a club of boys, under the guidance of Rev. W. A. Dietrick. Mr. Ralph Cobb, who formerly owned Vinco, has purchased Delight, from Dr. Lambert, of Wyandotte, Michigan.

C. W. SCHMIDT, JR.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

the engine is new, as it is more liable to cut than the bronze bearing. Once the surface of a cast iron bearing has by careful use become glazed—that is, highly polished—it makes an almost indestructible bearing. We are sorry to note that a great many of the builders do not proportion the bearings on several sizes of engines, and for this reason we often hear complaints that engines of a certain size and of a certain make always give trouble in these parts; the fault, of course, is apparent.

#### Crank Shafts, Connecting Rods.

Drop-forged crank shafts are now almost universally used by all the larger concerns. They make a very strong and cheap crank shaft, and, as the metal in being drop-forged is first bent to the shape of the crank shaft, it goes without saying that they must be necessarily much stronger than a crank cut out of the solid stock, part of which will be cross-grained. Connected to the crank shaft we have the connecting, or what is sometimes called the Pitman rod. In some engines this is made of iron or steel, but in the great majority the usual practice now is to make the whole rod of bronze, as this does away with the necessity of adding the usual bronze boxes for the crank shaft connection. While on this subject, we would caution you against purchasing or building an engine that is what we call short connected; the connecting rod should be not less than twice the length of the stroke—and, in fact, two and a quarter times the length is much better. A great many builders are making their connecting rods only one and a half times the length in order to bring the center of gravity of their engines as low as possible.

[TO BE CONTINUED.]

### YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

#### Designing Competition.

We have reason to congratulate ourselves on the outcome of the third designing competition given under the auspices of FOREST AND STREAM. Twenty-seven designs were received and they have been turned over to the judge, Mr. Clinton H. Crane. Mr. Theodore C. Zerega will collaborate with Mr. Crane in judging the cabin plans. Owing to the large number of drawings submitted the task of passing on the drawings and awarding the prizes will be a difficult one, and will occupy considerable time. The judges' report will be published in FOREST AND STREAM as soon as decisions are rendered.

#### Royal Canadian Y. C. Fixtures.

Royal Canadian Y. C. racing fixtures, season 1904:  
May 24, Tuesday.—Second class; 16ft., ballasted class; 16ft. skiff class; 12 and 14ft. dinghy class.  
June 4, Saturday.—Cruising race. Fleet in two divisions: First division, 35ft. and over; second, all under 35ft.  
June 11, Saturday.—Fleet maneuvers; 16ft. skiff class; 12 and 14ft. dinghy class.  
June 18, Saturday.—First class cruising race.  
June 25, Saturday.—Second class; 16ft. ballasted class.  
July 1, Friday.—Queen's Cup.  
July 2, Saturday.—Handicap cruising race, entire fleet.  
July 9, Saturday.—16ft. skiff class; 12 and 14ft. dinghy class.  
July 16 and 23, Saturday.—L. Y. R. A.  
July 30 to August 1, Saturday to Monday.—Cruising race. Fleet in two divisions: 16ft. skiff class; 12 and 14ft. dinghy class.  
August 6, Saturday.—Second class; 16ft. ballasted class.  
August 13, Saturday.—First class cruising race.  
August 20, Saturday.—16ft. skiff class; 12 and 14ft. dinghy class.  
August 27, Saturday.—First class (15 mile triangle).  
September 3 to 5, Saturday and Monday.—Handicap cruising race, entire fleet.  
September 10, Saturday.—"Prince of Wales" cup race, all classes.  
September 17, Saturday.—16ft. skiff class; 12 and 14ft. dinghy class.  
September 24, Saturday.—Handicap cruising race, entire fleet.  
N. B.—First class comprises yachts of 35ft. and over; second class comprises yachts of 30ft., 25ft., and 20ft.

#### Rhode Island Y. C.

The annual meeting of the Rhode Island Y. C. was held in Providence, on the evening of Feb. 28. Vice-Commodore Church presided until the election of officers, after which Dr. F. T. Rogers assumed the duties of commodore. The following officers were elected: Com., Dr. F. T. Rogers; Vice-Com., Dr. William P. Church; Rear-Com., W. O. Todd; Sec'y and Treas., George E. Darling; Measurers, Scott C. Burlingame, H. A. Capron; Directors-at-large, Frank P. Eddy, Arthur E. Austin, John M. Richmond; Race Committee, Frederic S. Nock, Bradbury L. Barnes, Dr. H. B. Potter, William F. Boone, Charles H. Mathewson; Committee on Admission, E. L. Fuller, E. M. Clark, Gustavus Taylor, H. A. Munroe, N. B. Horton, H. B. Wright, G. R. Alexander, Percy A. Harden, A. T. Vigneron; House Committee, W. W. Bloomer, A. L. Young, H. B. Wright; Potter's Cove Committee, F. L. Davenport, George E. Darling, John Schleicher; Social Committee, Scott C. Burlingame, Fred A. Barnes, Chas. G. Easton, Miles A. Carter, Percy A. Harden. Bradbury L. Barnes, Frederic S. Nock, and Scott C. Burlingame were appointed delegates to the Narragansett Bay Y. R. A.

#### Boat Building at City Island.

At Robert Jacobs' yard, City Island, there are three power boats building, all from designs by Mr. Jacobs. The largest of the trio is for Mr. W. Gould Brokaw. She is 65ft. over all and 7ft. breadth. Her power will be furnished by a French automobile engine of 200 horse-power.

The second boat is for Mr. W. K. Vanderbilt, and is 40ft. over all, 35ft. waterline, and 6in. draft. She will be fitted with a 60 horse-power Mors motor, and it is expected that she will develop a speed of about 20 miles.

Mr. James E. Martin is the owner of the third boat. She is 40ft. over all, 35ft. waterline, and 6ft. breadth. A 35 horse-power Smith & Mabley engine will drive her at about 18 miles.

Mr. Jacobs has also closed contract with Messrs. Tams, Lemoine & Crane for a large cruising launch, which boat will be driven by a Smith & Mabley engine. She is 57ft. over all and 50ft. waterline.

The schooner Amorita, Mr. Richard Mansfield, owner, is to receive a new deck, and she will also have a new suit of Ratsey & Laphorne sails.

The schooner Sea Fox, Mr. Anson Phelps Stokes, owner, has received extensive alterations. Her interior has been changed and refitted, and her centerboard has been cut down so that the top of the trunk is now flush with the cabin floor. The work on both of the latter boats was done at the Jacobs yard.

At Frank Wood's yard, which has been greatly enlarged and improved by the addition of new machinery, several boats are building. The largest is a good sized steel steam yacht from Messrs. Gardiner & Cox's designs. The 30ft. waterline cruising yawl from Messrs. A. Cary Smith & Ferris' designs is completed. Two speed launches are being built from designs by Messrs. Tams, Lemoine & Crane.

#### Tragic End of Yachting Cruise.

Australian advices bring details of a tragic conclusion to an attempt to cruise round the world in a two and a half ton yacht named the Kia Oro. In high spirits Mr. Horace Buckridge, who saw active service in South Africa with Thomeycroft's Horse and the Imperial Mounted Infantry, and Mr. G. H. Sowden set out on their adventurous voyage from Gisborne, in New Zealand. London was their first great objective, and until the seventh day of the voyage they were confident of reaching it. On that day their troubles began. First Mr. Sowden was struck on the head by the boom and had to give in, and a few hours later Mr. Buckridge, while taking in the sail and clearing away the gear, fell from aloft. It was not a great fall, but his injuries terminated fatally on the following night. For three days Mr. Sowden kept the body of his companion on board, but at the end of that time he had to consign it to the deep. To do so—Mr. Buckridge weighing 192 pounds—he had to rig up a tackle, and hoist him by that means over the side, attaching pieces of iron to the body to weigh it down. Mr. Sowden decided to return after that, but the weather was so bad that he almost gave up hope of ever reaching land. For eighteen days and nights he had no sleep, being continually at the tiller, and lived on biscuits, all the fresh food having gone bad owing to the stuffiness of the cabin. He ultimately reached Gisborne, more dead than alive.—Philadelphia Telegraph.

#### New Smith & Ferris Steam Yacht.

There is building at the yard of Messrs. J. M. Baylis & Son, Port Jefferson, L. I., a wooden steam yacht from designs by Messrs. A. Cary Smith & Ferris. The yacht is 87ft. 6in. over all, 78ft. waterline, 17ft. 4in. breadth, 5ft. 10 in. draft, and least freeboard, 3ft. 6in.

#### Erl King in Collision.

Mr. A. E. Tower's steam yacht, Erl King, put into Newport News, Va., on March 1 badly damaged, having been in collision with the steamship Orion during a thick fog. The yacht was on her way to Florida with her owner and several guests on board, but she will be repaired before proceeding.

#### Robert W. Rutherford Dead.

Robert Walter Rutherford died suddenly at his home in New York city on March 3. He was a member of the New York Y. C.

#### Steam Yacht Candida Sold.

The following transfers have been made through Manning's Yacht Agency: The British-built steam yacht Candida has been purchased by Mr. J. L. B. Mott, of New York city; the schooner yacht Meteor has been sold to Mr. Edward Rogers; the schooner yacht Triton has been sold, and will be used as a pilot boat at Apalachicola, Fla., and the 60ft. launch Sigma has been sold to a Philadelphia yachtsman.

#### New Launch for A. Stein.

There is building at the Greenwich yacht yard a 25ft. launch from designs made by Mr. Morgan Barney for Mr. Alexander Stein. She will be equipped with a 14 horse-power Buffalo engine.

#### Launch Pharamond Sold.

Mr. Frank Bowne Jones has sold the large gasoline launch Pharamond for Mr. W. T. Rainey, N. Y. Y. C., to Mr. William H. Briggs, vice-commodore of the Rochester Y. C.

#### Enchantress Purchased by an American.

The following sales have been made through the agency of Mr. A. J. McIntosh: British-built steam yacht Enchantress, purchased by Mr. N. L. McCready; sloop Louise, Mr. James Corrigan to Mr. H. W. Merrill; Launch Clara to Mr. H. E. Bemis; knockabout Wriggle, Mr. G. Searing Wilson to Mr. F. F. Catlin; sloop Outing, Mr. John Waterhouse to Mr. George W. Titcomb, and an electric launch to Mr. Charles G. Gates.

#### The Bailey Bill.

The Bailey bill provides for a channel between Jamaica Bay and Great South Bay, and appropriates \$200,000 to carry out the work. Delegations from many of the larger towns on the south side of Long Island have already appeared before the different committees having the bill in

charge urging its passage. In connection with the project Congressman Townsend Scudder has introduced a bill at Washington appropriating \$150,000 for a like purpose. This has the indorsement of the War Department as providing ways and means for transporting munitions and supplies.

#### Columbia Y. C.

The annual meeting of the Columbia Y. C. was held a short time ago at the club house, foot of West Eighty-sixth street, New York city, and the following officers were elected: Com., Charles A. Starbuck, steam yacht Carmen; Vice-Com., Charles G. Gates, steam yacht Charmery; Rear-Com., Whitney Lyon; Sec'y, George R. Branson; Treas., James Stewart; Meas., John H. McIntosh; Fleet Surgeon, Dr. M. O. Arnold; Trustees, A. Kroger and J. V. B. Clarkson. The first match for the American Power Boat Association's challenge cup will be started off the Columbia Y. C. clubhouse. The match is scheduled for June 23, 24, and 25.

#### Anglesea Yachtsmen Organize.

The yachtsmen of Anglesea, N. J., have organized an association with the following officers: President, Captain John Taylor; Secretary, Harry H. Hoffman; Treasurer, Harry McGinley.

#### Another Entry for Harmsworth Cup.

Mr. A. D. P. Smith, of Messrs. Smith & Mabley, is to have another entry in the race for the Harmsworth cup. The second boat will be built at once, and probably from designs made by Mr. Clinton H. Crane.

#### Yawl Veery Sold.

Mr. W. P. Allen, St. Paul, Minn., has purchased, through the agency of Stanley M. Seaman, the yawl Veery from Mr. Geo. A. Suter.

## Rifle Range and Gallery.

#### Fixtures.

June 12-20.—National Schuetzenbund Festival, Union Hill, Schuetzen Park, N. J.

#### The Annual Indoor Rifle Tournament.

THE annual gallery rifle tournament, which was first started by the New York Sportsmen's Association some years ago, and which is now carried on by the Zettler Rifle Club, of New York, was begun at 159 West Twenty-third street on Feb. 27, and was continued daily (Sunday, Feb. 28, excepted), until Saturday night, March 5.

The programme was much the same as that of last year, except that the donated prizes to the champion target were largely increased.

Like the annual Election Day match, the annual gallery tournament has become one of the rifle fixtures of the riflemen of New York. During the seven days of the gallery last week, there were riflemen entered in the champion match from five States, viz.: Massachusetts, Connecticut, New York, New Jersey and Pennsylvania. The men who were present and took part in this year's contest were the best and most expert marksmen that these States can produce, either in gallery shooting or on the outdoor range, 200yds.

At the tournament of last year, L. P. Ittel, of Allegheny City, Pa., carried away the honors, as champion, with the score of 2457, 100 shots. Ittel was again on hand last week looking for the honors, but the fates were against him, for when the tournament was closed, Ittel was only a good second. The honors went to Louis C. Buss, of Brooklyn. Buss is one of the younger group of riflemen in and about New York, who are coming to the front. While the winning score, 2456, is below the record of these tournaments, the averages of the men engaged in this year's contest were better. Of the forty entries in the champion match, twenty-six had an average of 240 or better. This speaks well for the individual as well as for his rifle and ammunition. The contest on the ring target and the bullseye targets was of the dog-eat-dog order. Three men finished tied for first place on the bullseye target, and there were also three ties for first place on the ring target.

L. P. Ittel succeeded in carrying away the Zimmermann trophy after a sharp contest with L. C. Buss.

Harry Fenwirth, of New York, won the Zettler trophy. The fine Stevens rifle presented by the J. Stevens Arms & Tool Co., was won by Mr. Ittel.

The new champion, L. C. Buss, took the Peters Cartridge Co.'s gold trophy.

The Zettler Rifle Club, under the leadership of its vice-president, Henry D. Muller, after the close of the tournament, entertained the assembled marksmen to a lunch.

The scores which are appended give a good illustration of the high quality of the shooting during the week:

Champion match, 100 shots; possible 2500; 25-ring target; 75ft. distance; offhand:

Louis C. Buss, Brooklyn, N. Y., Bal.-Remington—245 249 247 246 244 244 248 245 243 245—2456

Louis P. Ittel, Allegheny City, Pa., Stevens-Pope—246 243 248 245 245 244 245 248 246 245—2455

E. Van Zandt, Bal.-Zettler—245 247 245 248 242 249 246 244 243 242—2451

W. A. Tewes, Jersey City, N. J., Bal.-Winchester—246 244 248 249 241 243 245 241 245 248—2450

R. Gute, Middle Village, L. I., Stevens-Pope—242 246 246 245 247 240 246 245 244 249—2450

Dr. W. G. Hudson, New York City, New Remington, Schuetzen model—248 246 244 248 243 242 243 242 245 245—2446

Harry M. Pope, Springfield, Mass., Stevens-Pope—246 241 243 244 244 246 242 247 245 246—2445

Theo. R. Geisel, Springfield, Mass., Winchester-Pope—241 246 245 241 245 245 244 246 246 244—2443

Louis P. Hansen, Jersey City, N. J., Bal.-Pope—247 244 247 240 241 242 247 244 244 243—2439

Geo. Schlicht, Guttenberg, N. J., Stevens-Pope—241 241 247 247 245 244 245 239 245—2436

A. J. Huebner, Pittsburg, Pa., Stevens-Pope—246 238 243 244 244 246 247 241 243 244—2436

M. Dorrlor, Jersey City, N. J., Bal.-Pope—246 246 242 241 239 239 247 247 245 240—2432

E. C. Reed, Pittsburg, Pa., Stevens-Pope—244 244 245 242 244 237 243 242 247 243—2431

R Gute.....	75 75 74 74 74
E Van Zandt.....	75 75 75 74 73

Bullseye target, twenty-five prizes: T. H. Keller 15½, T. R. Geisel 15½, L. P. Ittel 15½, E. C. Reid 16½, L. Reali 16½, S. N. Murphy 17½, Mahlenbrock 19, H. D. Muller 20, W. A. Lemcke 21, J. H. Taylor 21½, C. Zettler, Jr., 21½, O. Schwanermann 21½, F. Kost 22½, S. Buzzini 22½, G. H. Wiegman 23½, H. M. Pope 23½, Wm. Koch 24, I. Martin 24, H. Purkess 25, H. C. Zettler 25½, R. Gute 26, A. Kronsberg 26, M. Dorrier 26, W. Rosenbaum 27½, F. T. Conti 28, C. D. Felici 28.

Most bullseyes, three prizes: S. N. Murphy 180, T. H. Keller 162, S. Buzzini 159.

Zimmermann trophy, three-shot scores, two best to count, possible 78: Won by L. P. Ittel, of Allegheny City, Pa.; scores 38, 37. L. C. Buss, New York, second; scores 37, 37.

### The National Bund.

A MEETING of the delegates of the affiliated societies of the National Schuetzen Bund was held at headquarters of the Bund, No. 12 St. Mark's Place, New York city, Feb. 26.

Nearly all of the local societies in and about New York and eastern New Jersey were present. The president, Henry Kroeger, presided. A letter from W. Milton Farrow, of Washington, D. C., was read. He stated that President Roosevelt would probably present the Bund with a silver cup (Becher) for the target of honor. A number of societies reported through their delegates the amount of their donations to the target of honor as follows: The Rod and Gun Club, Springfield, Mass., \$25; German-American Shooting Society, New York, \$50; Hudson Rifle Club, Jersey City, N. J., \$25; New York Schuetzen Bund No. 1, \$150 (in six prizes); Officers' Casino, N. Y. S. B. No. 1, \$50 (in two prizes); Williamsburg Shooting Society, \$50; Union Hill Schuetzen Corps, \$50; Miller Rifle and Pistol Club, Hoboken, N. J., \$25.

A resolution was adopted to present invitations to the governors of New York and New Jersey to be present on some one of the days of the festival.

Letters of invitation were ordered to be presented to the mayors of New York city, Jersey City, Hoboken, West Hoboken, North Bergen, town of Union, and the Sheriff of Hudson county, John Zeller. Resolved, that no shooting society would be admitted to the Bund for the coming festival after May 1, 1904.

### New York City Corps.

At the New York Schuetzen Corps' bi-monthly shoot, Feb. 26, seventy-two members participated. In the competition on the ring target, R. Gute was again high. Geo. Ludwig was second.

In the competition on the bullseye target, Henry Meyer came to the front with a good center shot, which measured 31 degrees. J. N. F. Siebs was second with 33 degrees.

Ten-shot scores, 25-ring target, distance 75ft., two scores to count: R. Gute 242, 243; Geo. Ludwig 243, 239; B. Zettler 234, 240; J. N. F. Siebs 234, 233; O. Schwanermann 234, 236; Geo. Offermann 232, 232; H. Haase, 233, 227; F. Facompre 229, 231; J. C. Bonn 230, 232; H. Beckmann 228, 233; J. Facklam 225, 237; P. Heidelberger 224, 226; H. D. Meyer 232, 229; H. Nordbruch 227, 226; C. Schmitz 223, 224; W. Schultz 223, 225; C. Brinckama 217, 234; C. Wahmann 225, 225; J. G. Voss 227, 217; C. Konig 227, 216; A. W. Lemcke 220, 227; D. Pepper 226, 217; H. Rottger 216, 227; J. G. Tholker 213, 225; G. Thomas 227, 218; C. Mann 211, 230; J. H. Hainhorst 219, 225; F. Feldhusen 223, 215; J. Jantzen 231, 216; J. C. Kruse 227, 206; H. Koster 223, 215; H. Leopold 210, 219; J. H. Grote 215, 209; M. J. Then 215, 212; C. Roffmann 202, 222; J. Paradies 214, 215; H. Meyn 222, 212; J. H. Meyer 223, 210; E. F. Lankenau 216, 204; N. G. L. Beversten 206, 230; H. Decker 226, 205; F. Dierks 211, 213; J. H. Doscher 219, 213; W. Dahl 211, 227; H. R. Coplan 213, 206; H. Winter 215, 210; H. Lohden 216, 212; H. Koster 206, 203; G. Junge 209, 203; A. Giebelhaus 210, 212; H. Konig 207, 204; H. Quinten 218, 195; Max Von Dwingelo 202, 203; H. C. Hainhorst 210, 204; N. Jantzen 193, 197; D. von der Lieth 199, 200;

L. L. Goldstein 181, 193; H. Horenberger 185, 205; H. D. Von Hein 191, 195; Aug. Beckmann 198, 195; J. C. Brinckmann 169, 213; H. Haaren 172, 191; N. W. Haaren 188, 175; J. Gobber 189, 183; D. Von Glahn 176, 181; D. Fieken 164, 201; D. Dede 172, 197; F. Schultz 193, 203; W. Schaefer 195, 209; H. Offermann 198, 198; J. May 174, 198; A. Lederhaus 174, 167.

Bullseye target, 4in. carton, the best center to count by measurement: Henry Meyn 31 degrees; J. N. F. Siebs 33, C. Schmetz 41, D. Pepper 50, W. Schultz 64½, H. Offermann 67, C. Konig 70½, F. Feldhusen 72, G. Ludwig 81, C. Wahman 82½, Max Von Dwingelo 83½, R. Gute 84, J. G. Tholke 85½, H. Winter 97½, O. Schwanermann 98½, C. Brinckmann 103; N. C. Beversten 103, J. Jantzen 108, F. Facompre 108, G. Junge 108½, D. von der Lieth 114, H. Lohden 115, G. Thomas 115½, H. Konig 133½, H. D. Meyer 141, W. Dohl 146.

### Rifle at Shell Mound.

SAN FRANCISCO, Cal., Feb. 22.—An indoor range for rifle, pistol and revolver has just been established in this city. This style of range has not been popular heretofore, as open air shooting at standard distances is feasible here the year around. It remains to be seen whether this new departure will prove successful.

At the last shoot at Shell Mound the following scores were made:

Germania Schuetzen Club, monthly medal shoot: First champion class, F. P. Schuster 229; second champion class, W. F. Blasse 211; first class, H. Stelling, 209; second class, M. Kolander 204; third class, H. Meyer 195; best first shot, F. P. Schuster 23; best last shot, A. Gehret 25.

University of California, Junior Class: J. C. Whitman 45, R. J. Turner 41, R. S. Daniels 42, A. R. Whitman 40, R. O. Hoedel 41, W. Sperry 39, W. N. Gabriel 38, J. S. Fry 36, F. Adler 37, J. M. Nightingale 38, R. A. Maddox 37, W. S. Robertson 36, J. S. Dobbins 36, T. Williamson 43, S. E. Montgomery 42, J. A. Pierce 44.

The Golden Gate Rifle and Pistol Club monthly medal shoot: Fifty-shot match: A. Gehret 1117, M. Kolander 1027.

Re-entry match: A. Gehret 232, 223, 222, 221, 219; M. Blasse 222, 216; W. F. Blasse 226; M. Kolander 213, 208, 207, 206, 205; H. P. Nelson 209.

Gold medals: A. Gehret 220, O. A. Bremer 211.

Silver medals: H. P. Nelson 209.

Bronze medals: G. Tammeyer 217, 210, 206, 204, 204; A. M. Poulsen 207, 175; E. Englander 179, 144; W. Greaves 173, 168.

Medal bars: G. Tammeyer 209.

Pistol competition.—Bronze medal: G. E. Frahm 91, 87, 86, 85; J. Kullmann, 84; E. C. Cordell, 79, 78, 67.

Re-entry match: W. F. Blasse 93, 93, 90, 88, 86, 80; J. Kullmann, 87; George E. Frahm, 85; E. C. Cordell, 79, 78; Charles Becker, 84, 84, 78, 78; H. P. Nelson, 80, 74, 75.

Military revolver.—Bronze medal: J. Kullmann 81.

Re-entry match: E. Somerville 75, Wm. Proll 91, 90, 89, 88, 88, 87, 87, 85, 86, 84, 82; Charles Cleveland 76, 69, 67.

ROEL.

### Rifle Notes.

The competitions of the Pinehurst, N. C., Pistol Club are growing in popular interest. Both ladies and gentlemen join in the contests. In a shoot recently, Mr. S. H. Ordway, of New York, won the men's cup, which was a prize for the best net score. Mr. Ordway scored 459. Mr. H. Nelson Burroughs, of Philadelphia, was again the winner of the gross score cup, with 398 gross, and an average of 79 3-5. M. C. Beebe, of Pittsburg, and Dr. Herbert J. Hall, of Marblehead, Mass., the other scratch men, scored 377 and 354, respectively, the gross averages being 75 2-5 and 70 4-5. Other competitors for this cup were G. N. McMillan, of Detroit; B. R. Smith and R. J. Barker, Jr., of New York, and E. I. Marvell, of Fall River.

Miss S. N. Cutler, of Newton, Mass., won the women's net score trophy with 294, a gross average of 45 2-5. Miss Augusta Endicott, of Boston, the winner of last week's event, who shot from scratch, made a pretty target of 269 gross, an average of 53 4-5.

Other lady contestants were Miss Fanny Heffelfinger, of Minneapolis; Mrs. S. H. Ordway, of New York; Mrs. M. C. Beebe, of Pittsburg; Mrs. St. John Smith, Portland, Me., and Miss Barnett, of New Haven.

Mrs. Nellie Bennett, of Denver, famous as one of America's most famous lady target shooters at the traps, is also eminently expert with the rifle. At the Sportsmen's show last week she broke glass balls, split cards and made other shots requiring marvelous precision with the rifle.

## Trapshooting.

If you want your shoot to be announced here send a notice like the following:

### Fixtures.

March 9.—Guttenburg, N. J.—Second annual three-man team championship; 10 birds per man; \$15 per team. Gus Greiff, Mgr., 255 W. 111th street, New York.

March 12.—Bay Ridge, L. I.—Yale Gun Club-Crescent Athletic Club.

March 12.—Bound Brook, N. J., Gun Club all-day merchandise shoot. Stanley Brampton, Sec'y.

March 22-25.—Crawfordsville, Ind., Gun Club's tournament.

March 19.—North Branch, N. J., merchandise target shoot.

March 23-24.—Allentown, Pa.—Two-day target tournament at Duck Farm Hotel. C. F. Kramlich, Mgr.

April 1.—Shingle House, Pa.—Oswago Valley Rod and Gun Club seventh tournament. U. S. Dodge, Sec'y, Millport, Pa.

April 1-2.—Newark, N. J.—Forester Gun Club tournament.

April 6.—Sheepshead Bay, L. I.—Eastern amateur target championship, on grounds of Sheepshead Bay, L. I., Gun Club.

April 6-7.—Bristol, Tenn.—The Interstate Association's tournament, under the auspices of the Bristol Gun Club. S. W. Rhea, Sec'y.

April 12-13.—Indianapolis, Ind.—Indiana League of Trapshooters' annual tournament.

April 18-22.—Kansas City, Mo.—J. F. Schmelzer & Son's Arms Co. fourth Interstate midwinter shooting tournament; targets and live birds.

April 19.—Springfield, Mass., Shooting Club Patriots' Day tournament. C. L. Kites, Sec'y.

April 19-21.—Paducah, Ky., Gun Club's spring tournament. W. B. Kennedy, Sec'y.

April 20-21.—Rensselaer (Ind.) Gun Club amateur tournament.

Everette Brown, Mgr., Pleasant Grove, Ind.

April 21.—Easton, Pa.—The Independent Gun, Rifle and Pistol Club's first annual target tournament. Edw. F. Markley, Sec'y.

April 26.—Greenville, O., Gun Club amateur tournament. H. A. McCaughey, Sec'y.

April 26-27.—Pittsburg, Pa.—Herron Hill Gun Club tournament. \$100 added. Louis Lautenslager, Mgr.

April 26-29.—Kansas City.—Spring target tournament, at Blue River Park. R. S. Elliott, Mgr.

April 27-28.—Americus, Ga.—The Interstate Association's tournament, under the auspices of the Americus Gun Club. H. S. McCleskey, Sec'y.

May 3-4.—Wabash, Ind., Gun Club tournament.

May 3-5.—Junction City, Kans.—Kansas State Sportsmen's Association annual tournament. E. L. Wetzig, Sec'y.

May 4-5.—Nashville, Tenn.—The Interstate Association's tournament, under the auspices of the Cumberland Park Driving Club. Charles Eastman, Sec'y.

May 11-12.—Springfield, O., Gun Club's target tournament. Geo. Morgan, Sec'y.

May 11-13.—Spirit Lake, Ia.—Iowa State Sportsmen's Association tournament. J. Burmister, Sec'y.

May 12-13.—Wilmington, Del.—Wawaset Gun Club annual spring tournament. W. W. Foord, Sec'y.

May 16-18.—Southern Trapshooters' Association's thirteenth tournament at targets, under auspices of Vicksburg, Miss., Gun Club; \$500 added. J. J. Bradfield, Sec'y.

May 16-21.—York, Pa.—Tournament of Pennsylvania State Sportsmen's Association, under auspices of York City Gun Club. N. M. McSherry, Sec'y.

May 17-18.—Dubuque, Ia., Gun Club's fifth annual amateur target tournament. A. F. Heeb, Cor. Sec'y.

May 17-18.—Dallas, Tex.—The Interstate Association's tournament, under the auspices of the Dallas Gun Club. E. A. Mosely, Sec'y.

May 17-19.—Davenport, Ia.—Cumberland Gun Club's annual amateur tournament. W. F. Kroy, Sec'y.

May 18.—Boston, Mass., Gnn Club annual team target shoot. H. Kirkwood, Sec'y, 23 Elm street, Boston.

May 18-20.—Columbus, Neb.—Nebraska State Sportsmen's Association's twenty-seventh annual tournament. G. A. Schroeder, Sec'y.

May 19-20.—Oklahoma City.—Territorial Sportsmen's Association fifth annual tournament; \$300 added money. J. C. Clark, Sec'y.

May 20.—Charlotte, N. C., Gun Club tournament.

May 23-25.—Houston, Tex.—Texas State Sportsmen's Association tournament.

May 24-25.—Marshalltown, Ia., Gun Club two-day target tournament.

May 24-25.—Mt. Sterling, Ky.—Kentucky Trapshooters' League tournament. Frank Pragoff, Sec'y, Louisville, Ky.

May 25-26.—Shamokin, Pa., Gun Club Spring shoot. S. C. Yocum, Sec'y.

May 31.—Dayton, O.—Rohrer Island Gun Club spring target tournament. W. E. Kette, Sec'y.

June 1-3.—Watertown, S. D.—South Dakota State Sportsmen's Association tournament. F. J. Cory, Sec'y.

June 7-9.—Sioux City, Ia.—Soo Gun Club's tenth annual amateur tournament; added money. W. F. Duncan, Sec'y.

June 8-10.—Huntington, W. Va.—West Virginia State shoot. F. H. Merrick, Sec'y.

June 13.—Middleton, Wis., Gun Club tournament. Frank L. Pierstorff, Mgr.

June 14-16.—Akron, O.—Ohio Trapshooters' League target tournament. G. E. Wagoner, Sec'y.

June 14-16.—New London, Ia., Gun Club midsummer tournament. Dr. C. E. Cook, Sec'y.

June 14-17.—Warm Springs, Ga.—Target and live-bird tournament. Chas. L. Davis, Mgr.

June 15-17.—Lincoln, Ill.—Illinois State Sportsmen's Association tournament. James Davis, Sec'y.

June 21-24.—Indianapolis, Ind.—The Interstate Association's fifth Grand American handicap at targets. One thousand dollars added to the purses. Elmer E. Shaner, Secretary-Manager, 219 Coltart Square, Pittsburg, Pa.

June 27-July 2.—French Lick Springs, Ind.—Tournament of the National Gun Club. \$500 added money. John M. Lilly, Pres., Indianapolis.

July 4.—Richmond, Va.—East End Gun Club annual merchandise shoot. J. A. Anderson, Sec'y.

July 4-6.—Winona, Minn.—The Interstate Association's tournament, under the auspices of the Winona Sportsmen's Club. Oswald Leicht, Sec'y.

July 8-9.—Wausau, Wis.—Wisconsin League of Gun Clubs' State tournament. H. G. McCrossen, Sec'y.

July 19-20.—Shamokin, Pa., Gun Club midsummer shoot. S. C. Yocum, Sec'y.

July 19-22.—Cincinnati, O., Gun Club annual handicap.

July 27-28.—Grand Forks, N. D.—The Interstate Association's tournament, under the auspices of the Grand Forks Gun Club. W. M. Ferguson, Sec'y.

Aug. 10-12.—Brantford, Ont.—Dominion of Canada Trapshoot- ing and Game Protective Association's fourth annual tournament. A. B. Cutcliffe, Sec'y.

Aug. 15-20.—Buffalo, N. Y.—New York State shoot.

Aug. 15-22.—Indian tournament; place determined later.

Aug. 24-25.—Hot Springs, S. D.—The Interstate Association's tournament, under the auspices of the Hot Springs Gun Club. H. A. Gayhart, Sec'y.

## DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

The Rochester Rod and Gun Club have fixed upon May 4 and 5 as dates for their spring tournament. Prizes to the amount of \$200 or more will be offered.

Last Saturday, on the grounds of the Boston, Mass., Athletic Association Gun Club, at Riverside, Dr. E. F. Gleason, a member of this organization, broke 50 targets straight, and further, broke 98 targets out of 100.

The efficient secretary, Mr. H. Kirkwood, 23 Elm street, informs us that the Boston, Mass., Gun Club will hold their annual team shoot on May 18. Every shooter is welcome. Programmes and information can be obtained of the secretary.

In the first contest for the Sauer trophy, by the Crescent Athletic Club trapshooters, Mr. O. C. Grinnell and Mr. H. Werle- man tied on 24 out of 25, at the club shoot at Bay Ridge, L. I., last Saturday. The conditions pertaining to the monthly cups govern it also.

Mr. Geo. C. Ingraham, of Naacogdoches, Tex., has challenged Mr. F. M. Faurote to contest for the title of champion of Texas. Conditions, 100 live birds, \$100 a side. Mr. Ingraham will name a Texan to contest against Mr. Faurote in the event that he does not do so himself.

Mr. A. F. Heeb writes us as follows: "The Dubuque, Ia., Gun Club has selected May 17 and 18 for their dates for their fifth annual amateur target tournament, and have made arrangements with Mr. Chas. Budd to manage, and Mr. F. C. Whitney to act as cashier at this shoot. We expect a large attendance, and have the assurance of at least fifty shooters to be with us at our shoot."

The 100-target event at Pinehurst, recently, was a closely contested finish between Mr. H. C. Bridges, of Tarboro, N. C., and Mr. A. E. Lard, of Washington, D. C. They were a tie on 61 at the end of the 75th round. Bridges gained a lead of two in the last 25, finishing

The spring had been a dry one, and the crops were somewhat backward, but at last a nice gentle rain was falling, which bid fair to mend matters considerably. Said Sandy McTavish to Alec McNab, when they foregathered outside the village inn: "Hech, mon, here's juist what we're wantin' the noo. Its a magnificent rain for bringin' things oot o' the graun'," Whist, mon, Sandy," said Alec, with a shudder. "Dinna forgit that I've twa wives there."—County Gentleman.

**Re Division of Purses.**

*Editor Forest and Stream:*

The coming season of trapshooting promises to be a record-breaker, and as any prosperous sport will attract new blood, the question arises how may these beginners be kept at it. Conceding that trapshooting is no fad and is alike attractive to the youth and sportsman of all ages, it is worth trying to keep it clean and interesting.

The tournament is the Mecca of all shooters who have—or think they have—learned to shoot, and the end of the first day's shooting leaves a large number of the faithful entirely discouraged, and it is in the interest of these that this article is written and the suggestions which follow are made.

Earlier the natural expert won the bulk of all the purses, which he had a perfect right to do, under prevailing conditions, but which made the persistent amateur look absolutely ridiculous in his inability to land in the money and soon forced him back to his local club, where things were on an equality. To remedy the trouble and bring all classes of shooters together, the management and promoters have devised several schemes to overcome unfair and unequal conditions; namely, by handicapping, the Rose system or adding targets to the actual score made by the shooter, etc.

The system of handicapping, as at present applied to any but the most consistent target shot, is manifestly unfair and will sooner or later have to be discontinued.

The Rose system is good as far as it goes, but it does not reach the majority who are not in sight of the money. As for the "added targets," it must indeed be a jolt to self-respecting shooters to see their scores published with "added targets" appended.

Granting that the above schemes to equalize things have been beneficial to a certain extent, let us consider a plan, which, so far as the writer knows, is novel and untried.

Supposing a tournament having been duly announced, one hundred shooters are found to be in attendance—all amateurs and confident of winning. The first day's programme of 100 targets is shot in events of 10, 15 and 20 targets, without handicap, all standing at the natural distance of 16yds., added money to each event, regardless of who wins it. At the end of the day the totals of each shooter are found to range from say 94 down to 70, and with these totals we can tell exactly what every shooter having made a total of not less than 80 must do the following day to participate in the second day's "added money," which is simply to beat his or her individual score of the previous day and receive a cash value for every target shown in excess of that score. The value of each point (target increase in total for day) to be arrived at in this way. Assuming that 82 shooters entered on the second day and \$100 was added money. It was found that 31 shooters improved their scores from one to seven points and 51 shooters fell short of their previous record, and therefore have no interest in the added money. The 31 shooters increase their scores a total of 75 points (targets), and we find the cash value of each point to be \$1.33, which would give two shooters with an increase of 7 points—as figured in this illustration—about \$9.31 each; one with 6 would draw nearly \$8; one with 5, \$6.65; one with 4, \$5.30; six with 3, \$4 each; eight with 2, \$2.66 each, and twelve with 1, \$1.33 each. Presuming that none of the 31 are purse winners, it should be gratifying to the management to be able to see nearly one-half of the participants able to become better acquainted with the cashier, who is generally a clever fellow, and would pay an 80 to 85 man for points as cheerfully as he would the winner of first money.

While the above scheme may not be regarded as a "get-rich-quick" affair, it would do this: The 90 per cent. shooters would continue to fight for the purses, without a handicap, and the 80 per cent. shooters, continually striving to better their scores (for every improvement pays something), there would soon develop a sport so healthy that the recollection of earlier discouragements on the part of the novice or beginner would be a thing of the past.

The above system of dividing added money will be used at the Missouri State shoot, held in St. Louis, May 23 to 28, inclusive.

SEPARATOR.

**Meadow Spring—Narberth.**

ON Feb. 27 the Meadow Spring Gun Club and Narberth, Pa., Gun Club, had a closely contested fifteen-man team race, Meadow Spring finishing in the lead by the narrow margin of one target. The scores were 223 to 222. The race was quite even well up to the finish. The scores:

Meadow Spring—Taney 13, G. Smith 19, Harvey 17, Roberts 17, Hansell 14, Garrett 14, Lee 16, Gothard 13, Jones 14, Parsons 16, Pepper 14, Mardin 13, Alexander 10, Gibson 19, Martin 10; total Narberth—Barker 21, Hatterstadt 14, Sharp 13, Fryer 17, Duffield 17, Meigs 17, H. Davis 15, Flake 14, Alker 9, Humphries 20, Preist 11, Heist 18, Sayre 11, Hammel 15, Foster 12; total 222.

Twenty-five targets: Harvey 19, Hynes 19, Hansell 14, Foster 15, E. Hansell 9, Moore 6.

Ten targets: Duffield 6, Gothard 7, Sharp 6, Barker 8, Davis 8, Parsons 5, Martin 8, Garrett 7, McGuigan 4, Davis 9.

Ten targets: Roberts 10, Lee 9, Buchman 7, Ford 6, Gibson 6, Taney 6, Farr 7, Jones 7, Hansell 2, Snyder 2.

Fifteen targets: Hatterstadt 10, Snyder 7, Hansell 7, Alker 6, Duffield 5.

Ten targets: Humphries 10, Fryer 9, Martin 6, Sharp 5, Gibson 5.

Twenty-five targets: Gothard 17, Ford 17, Brown 14, Moore 14, Alexander 15, Gruie 15, Snyder 13, Highley 13, Davis 13, Gibson 14, Phillips 11, Spense 11, Carrell 12, Davis 8.

Fifteen targets: Lee 12, Sharp 11, Roberts 11, Farr 10, McGuigan 8.

**Wawaset Gun Club.**

WILMINGTON, Del., Feb. 27.—The shoot of the Wawaset Gun Club, postponed on Feb. 22, was finished to-day. A total of 4,500 targets were thrown. The high average for the day was won by Mr. Luther J. Squier, with a score of 67 out of 75, shooting from 16 to 22yds. Second high average was won by Mr. W. M. Foord, of Wilmington, 63 out of 75 from 18 and 20yds. Mr. J. Mowell Hawkins was third, 62 out of 75, 18 and 22yds. The visiting shooters were Messrs. J. Mowell Hawkins, L. S. German, Aberdeen, Md.; A. B. Richardson, Dover; R. King and Mr. Edmundson, Newport; W. Budd, Claymont; John Evans, Wyoming; J. A. McKelvey, Hockessin.

A summary of the shooting shows as follows: Shooting at 75 targets, Hawkins broke 62, McKelvey 61, German 61, Foord 63, Squier 67, Townsend 58, Springer 51, Ryan 47, Martin 51, Graham 59, DuPont 47, Richardson 60, Mason 60, Lyman 50, Bird 48, Burroughs, 57, Evans 41, Roberson 40, W. S. Townsend 40.

Shooting at 50, Cornog broke 42, McColey 37, Tuchten 39, Hanley 31, Miller 42.

Shooting at 65, Dr. Buck broke 46, C. Buck 47, Kendall 44.

King broke 41 out of 60, Ball broke 35 out of 45, Melchior broke 26 out of 35, and Jefferson and Hendrix 22 each. W. Potter broke 33 out of 40, Simon 32, Holt 27, Young 29.

Shooting at 25, Massey broke 22, Garrett 13, Donaldson 16, McArdle 24, Godwin 14, C. Potter 18, Beady 20, Ogden 17, Edmundson 21, Sands 9.

The handicaps in the merchandise events were 16 to 22yds. The first six prizes were won by amateurs. There were forty-six entries. The winners and their scores follow: R. C. McArdle 24, Stanley Tuchten 24, F. Massey 22, E. E. Cornog 22, R. G. McColey 22, Ed. Mason 22, J. A. McKelvey 21, L. S. German 21, W. Potter 21, R. Miller 21, E. Melchior, Jr., 21, Edmundson 21, W. M. Foord 20, J. Graham 20, W. Ball 20, George Simon 20, Dr. Buck 20, C. Beady 20, W. Ryan 19, C. Buck 19, J. L. Hauley 18, Hendrix 18.

**Aquidneck Gun Club.**

NEWPORT, R. I.—The usual single squad appeared at the grounds on Wednesday, March 2, and essayed to do things to the elusive, elusive bluerock. Particularly was this true of Peckham, who celebrated his first attempt since Christmas by scoring 44, running his first 22 straight. Bowder tagged close after with 41, while Powell negotiated 37, he having but just returned from a Southern quail trip, showing the change from animate to the inanimate target.

A few of the boys will attend the shoot at Narragansett Pier next Saturday, of the Canardett Club, where a contest for the State championship and a cup will take place. The present holder, Mr. E. C. Griffith, was challenged by F. C. Screwson, secretary of the above club.

Targets:	10	10	10	10	10	Total.	
Peckham	10	10	10	7	9	8	44
Bowder	9	9	8	6	9	41	
Powell	8	8	10	5	6	37	
Dring	5	10	7	6	7	35	
Alexander	5	6	8	6	5	30	

The annual meeting of the Aquidneck Gun Club, Newport, R. I., was held on Tuesday evening, March 1, when the officers for the ensuing year were chosen, reports presented and other business of importance transacted. The year just closed was a most successful one for the club, financially and otherwise. Two well-attended tournaments were given, the second annual, on May 30, having forty-three shooters. The membership shows a net gain of six for the year, there being seven elections and one resignation. Over 50,000 targets were trapped during the year. No announcement of the third annual tournament has been made, owing to the uncertainty of the club's tenure of its present grounds. The executive committee is now looking up an available site.

The officers elected were as follows: President, Wm. A. Dring; Vice-President, Ed. P. Gosling; Secretary-Treasurer, J. S. Coggeshall; Executive Committee, P. H. Powel, Wm. A. Dring, Ed. P. Gosling, Wm. M. Hughes and H. A. Peckham.

**U. M. C. Southern Squad.**

MACON, Ga., Feb. 29.—The Log Cabin Gun Club entertained the U. M. C. Southern Squad in a most royal manner here to-day. A large crowd was out, including many of the lady friends of the gun club members. The ladies were carried away with interest; and after the regular events were finished, urged Capt. Marshall to have the Squad shoot an extra 25 targets to prolong the excitement. Of course this was done, Capt. Marshall modestly adding that the Squad always shoots better when under the influence of feminine approval. After the shoot a committee from the gun club invited the Squad and ladies to enjoy a 6 o'clock barbecue, which resulted in a fitting climax to the afternoon sport. The local shooters shot exceedingly well, as the following scores show, the first five names comprising the Squad, the others the local sportsmen:

Squad: Marshall 89, Heikes 99, Budd 93, Heer 96, Anthony 87; total 464.

Local Team—W. Huff 95, Waters 87, C. Jones 89, Etheridge 90, Mills 85; total 446.

Americus, Ga., March 2.—The U. M. C. Southern Squad arrived here to-day and gave an exhibition shoot, under the auspices of the local gun club. There were over 600 spectators, which speaks volumes for the popularity of the visiting shooters. It was announced beforehand that big scores were not to be the order of the day, but some of the Squad seems "couldn't miss 'em," so the following scores, though not exceptionally large, present a very fair average: Marshall 90, Heikes 90, Budd 90, Heer 94, Anthony 94.

**Poughkeepsie Gun Club.**

POUGHKEEPSIE, N. Y., Feb. 25.—What was absolutely the worst conditions possible for shooting prevailed to-day. All present—even Jack Fanning—declared it the worst in their experience. The wind, blowing a fierce gale from the north directly in the face of the shooters, and the mercury at the zero point, made it almost impossible for a man to stay on the platform long enough to shoot the events out. And the targets. Whew! They were corks. When they emerged from the trap house they would be carried by the wind up, up, up, until almost out of sight, and in going up they were not at all particular as to steadiness, often, just as the trigger was pulled, they would suddenly jump straight up for five or six feet, and a goose egg on the score sheet would follow.

Notwithstanding the unfavorable conditions, the shooting in the cup race was very even, and really good, all things considered. Capt. Travers' work being of a very high order, the "old post-hole-digger" is certainly a wicked gun in the Captain's hands, no matter what the conditions. Scores:

Events:	1	2	3	4	5	6	7
Targets:	10	15	10	10	15	10	15
Fanning	7	9	7	5	...	...	...
Traver	7	12	6	9	13	8	9
Claymark	4	9	4	6	10	6	...
Hans	5	10	...	7	8	...	...

Events:	1	2	3	4	5	6	7
Targets:	10	15	10	10	15	10	15
Winans	5	8	8	5	10	...	...
Marshall	...	...	...	5	3	10	3
Smith	...	...	...	8	6	8	...
Cheney	...	...	...	1	4	...	...

Traver cup—result of events 4 and 5 with handicaps added: Traver (3) 25, Claymark (6) 22, Smith (5) 19, Hans (4) 19, Marshall (4) 17, Winans (5) 20, Cheney (7) 12.

SNANIWEH.

**Indianapolis Gun Club.**

INDIANAPOLIS, Ind., Feb. 27.—Seven tied on a full score of 50 in the contest for the Julius C. Walk & Son cup, at the shoot of the Indianapolis Gun Club to-day. Mr. Irby Bennett was a visitor. The handicap allowance:

Targets:	25	25	at Brk.	Targets:	25	25	at Brk.		
W T Nash, 6....	25	19	57	50	J Michaelis, 5....	20	21	60	46

**Rochester Rod and Gun Club.**

ROCHESTER, N. Y., March 2.—On the club grounds at Cobb's Hill, a strong attendance of the Rochester Rod and Gun Club members were gathered to-day. The shoot was the fourth of the Spring handicap series. Adkin and Clark were high with 23 actually broken.

Some of the members shot up back scores, the figures in parentheses denoting which scores were so shot.

Broke. Al'ncc. Tot'l.	Broke. Al'ncc. Tot'l.

# FOREST AND STREAM.

## A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1904, BY FOREST AND STREAM PUBLISHING CO.

TERMS, \$4 A YEAR, 10 CTS. A COPY.  
SIX MONTHS, \$2.

NEW YORK, SATURDAY, MARCH 19, 1904.

VOL. LXII.—No. 12.  
No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

### SUNDAY FISHING.

NEW JERSEY is considering the adoption of a law to prevent Sunday fishing. The merits and demerits, claims and counter-claims, of such a statute, discussed from a Sabbatarian point of view, have been pretty thoroughly threshed out, and there would be no good purpose in going over them again. The three things to remember and consider in regard to a law against angling on Sunday are these:

First—Fishermen will fish on Sunday, law or no law.

Second—A law which is unenforced is demoralizing, in that its contempt breeds a spirit of contempt of all law.

Third—Experience has demonstrated that while a Sunday fishing law is as a rule a dead letter, it is on occasion resorted to for the collection of blackmail or for the indulgence of spite.

These are the principles which hold good elsewhere. They would hold good in New Jersey.

### THE BOY AND THE GUN.

SENATOR ARMSTRONG'S two measures in the New York Legislature, Senate Bills Int. 27 and 28, make it a misdemeanor to sell a gun or other firearm, or ammunition, to any person under eighteen years of age, or for any person under eighteen years of age to have any gun or other firearm in any public place; or for any person to have in his possession any firearm of any kind in any public place without a police certificate.

To state these two measures is to show their absurd and objectionable character.

There is no good reason why boys under eighteen years should be forbidden the possession and use of firearms. The proper age at which any given boy may have a gun is something to be determined by parental discretion. It is purely a matter of the individual judgment of father and mother. Some boys show themselves to be perfectly safe handlers of firearms before they are in their teens; others should never be trusted with a gun, not even if they lived to the age of Methuselah. But whether early or late, the gun age is something properly outside of the sphere of the State to determine, and something properly within the domestic regulation of the family.

Moreover, shooting is as good sport for boys under eighteen years of age as for those over eighteen. It is a healthy, sensible mode of outdoor recreation, essentially manly in its nature, and when taken up by boys is man-making. It is of benefit to the individual and of inestimable value to the aggregate of society.

Boyhood is the golden age when tastes are formed and fixed for life. The majority of shooters now gray-haired owe their life-through enjoyment of shooting to the taste for it formed in boyhood days. No recollections of youth are more vivid or more pleasurable than those of the days afield. No field companionship is more delightful than that of father and son in the game covers. To forbid the boy shooting, then, would be not only to deprive him and his elders of a wholesome pleasure while the boy is a boy, but it would prevent the formation of tastes whose indulgence would give him pleasure when he gets to be a man. Any such widespread deprivation as is contemplated by the Armstrong bill could be reckoned as nothing short of a public wrong. Forbid the boy shooting! Forsooth, whoever originated that notion could never have been a boy who knew for himself the innocent pleasures of the field.

As for those of us who have a vivid recollection of early days afield, who, now that we are old, find a new and different pleasure in inducting our youngsters into the art of shooting-flying, who believe that the opportunities we valued and enjoyed should be maintained for

the enjoying and valuing of the new generation, it behooves every such one, who is a citizen of New York, to enter his protest against the enactment of the Armstrong bill.

The further propositions incorporated in the Armstrong measures, to require every gunner to take out a police license before he can go shooting, is a fantastic scheme which should not be considered seriously by any legislative committee that has not taken leave of its senses.

### FISHING NOT PUBLIC USE.

THE New Jersey Court of Errors and Appeals has ruled that the right to fish in an inland lake "cannot be separated from the ownership of the lake and taken under the power of eminent domain, because, first, the natural supply of fish therein is so small as to be incapable of meeting a public demand; and, second, the object of acquiring such a right is not use, which implies utility, but mere sport or pastime."

This is the final outcome of the celebrated Swartswood Lake case, which was brought by Andrew Albright, the owner of the lake, against Joseph A. Cortwright, for fishing trespass. Mr. Albright's fight to establish his right to his own has been a long one. It began six years ago, when, having come into possession of the lake, he built a summer home on an island and settled down to enjoy the view and the quiet. The anticipated repose and seclusion were not realized. Swartswood had from time immemorial been the free fishing ground of the people round about; and the fishermen were now not in the least deterred by the new owner's trespass sign from continuing to enjoy their time-honored privilege. Mr. Albright tried polite persuasion, impolite threats, a license system which failed, and finally a lawsuit. He brought action against one of the trespassers, Joseph A. Cortwright, a farmer of the vicinity, and secured his conviction. This aroused popular indignation. Mass meetings were held. Free fishing was made a political issue, and the Assemblyman of the district secured the enactment of a law which declared public the fishing of any lake exceeding 100 acres in extent. Nothing daunted, the owner of Swartswood took the case before the Supreme Court for a determination of its constitutionality. Here the statute was upheld. Then Mr. Albright carried the case up to the court of last resort, where he has just obtained the decision reported in another column.

It is interesting to note that the view taken by the Court is substantially identical with the opinion expressed by Kenneth Fowler, Esq., of the Hudson County Bar, in our issue of June 6, 1903.

### THE SHIPMENT OF AMMUNITION.

THE transportation of dynamite and other high explosives is conducted under the close supervision of government inspectors, and is rightly regulated by a code of rigid rules governing its handling and shipment. Railroad companies make many restrictions as to the traffic and the rate classification is very high. Express companies are forbidden to handle high explosives. All this is as it should be.

In a bill introduced in the United States Senate by Mr. Elkins (S.4319), relating to the subject, the extraordinary mistake has been made of classing with high explosives, and so including in the scope of the bill, shotgun, revolver and rifle ammunition. This inclusion we term a mistake, because it is impossible to conceive that such a classification of ammunition with high explosives could have been made deliberately and with full information. This product is not of a nature to require any such restriction. Past experience and present practice demonstrate the perfect safety of the shipment of these low explosives by the ordinary channels of freight and express, along with other commodities. Ammunition is carried by railroads under a low freight classification; express companies handle it, fire departments and insurance companies have made exhaustive tests as to danger in case of fire, and have determined that there is absolutely none. No accidents have happened in transportation, either in original packages or in broken lots. Shotgun and rifle and revolver ammunition is shipped in numberless packages every day, and it is within the personal experience of tens of thousands of users that the shipment is perfectly safe.

There is absolutely no good reason for making any such change as that proposed by the Elkins bill with respect to the transportation of ammunition. To put the contemplated restriction in practice would mean measureless trouble to shippers and users, and vastly increased expense to the consumer. In view of the needlessness of the restriction and the hardship it would entail upon all concerned, the Elkins bill should be amended in committee by the elision of the clause "such cartridges as are ordinarily used in sporting or fowling pieces or in rifle or revolver practice."

This is a matter which may very properly be taken up by individuals, and concerning which letters of protest should be written to Senators.

### ROBIN REDBREAST.

THE plea which Assemblyman Scovel, of Camden, made on behalf of the robin in the New Jersey Assembly last week must be counted as one of the curiosities of legislative debate. There is in New Jersey some such prejudice against the robin on the part of fruit growers as Mr. W. B. Mershon tells us exists in Michigan; and a bill was before the Legislature legalizing the killing of robins as fruit destroyers. In opposition to the bill Mr. Scovel said:

"The robin was first a magpie and gray in color and unprepossessing in general appearance, but with a most sympathetic nature. He approached the Cross of Calvary at the time of the Crucifixion, timidly uttering cries of grief. With his wings he tried to wipe off the face of Jesus, and with his beak he tried to draw forth one of the thorns from the forehead. A single drop of blood fell on his breast, and from then until now he has been called 'red breast.' He is the bird of God, the herald of the glad tidings of spring, and I shall vote to protect him if every man in the House votes against him."

The press despatches say that the House was carried away by the eloquent plea, and straightway rejected the bill by a unanimous vote.

Now the fact is—though this is of slight consequence—that the robin, which the legend associates with the Cross, is the European robin, which is another bird, altogether distinct from the American species. The European bird is in classification nearer a warbler than a thrush, in size is half as large as the robin, in color is of a very different and brighter breast color, and in characteristics is, as Oliver Wendell Holmes once wrote, "a little domestic bird that fed at the table, instead of a great, fidgety, jerky, whooping thrush." There is a further contrast in song. "The songs of the two are as different as possible," wrote Mr. Francis Moonan, in his charming sketch of the English robin, in our issue of January 9.

So much for the European *Erythacus rubecula* and the American *Turdus migratorius*. They are two birds; yet as our species was so like the one they had known at home that the English settlers gave it the familiar name, it were just as well that it should share all the superstitions, legendary regard and protective sentimentalism unto the name appertaining. If New Jersey legislators be unconvinced by the statistical arguments of the economic ornithologists, may there always be a Scovel to beguile them with the legend of the robin breast dyed blood red at Calvary; or, as another superstition has it, scorched by the fires of hell, whither it flies daily, with one drop of water at a time, in the hope of quenching them. If the small boys of our enlightened age are not amenable to the Band of Hope humane teachings of to-day, instil in them the eighteenth century belief that gave immunity to the English robin:

I found a robin's nest within our shed,  
And in the barn a wren has young ones bred:  
I never take away their nest, nor try  
To catch the old ones, lest a friend should die.  
Dick took a wren's nest from the cottage side,  
And ere a twelvemonth pass'd his mother dy'd.

Among the contents of our next issue will be a continuation of "The Trails of the Pathfinders," and an illustrated paper descriptive of the strenuous life of the Gloucester fishermen.

The annual banquet of the Massachusetts Fish and Game Protective Association was held at the Hotel Brunswick, Boston, on Tuesday evening of this week.

# THE SPORTSMAN TOURIST

## Blowpipe Men of the Philippines.

MANILA, P. I., Jan. 15.—*Editor Forest and Stream:* There is a strange class of individuals in the Philippine Islands, who utilize the blowpipe of bamboo or other wood for hundreds of purposes in peaceful pursuits and in battle. The annexed illustrations are for the purpose of giving the reader an idea of the nature of these odd weapons. Figure 1 is the commonest description of blowpipe used by the natives for the purpose of shooting clay balls, darts, little arrows and the like. This crude affair is made from a section of wood about three feet long and from one to two inches in diameter, with the hollow portion about half the original exterior diameter. The exterior is usually rough and crude in the bamboo stock, but the interior is quite free and smooth, except the ridges at the partition walls, which ridges may be removed by using a scraping affair, leaving the interior channel very even and ready for passage of an object. But these tubes are not always for shooting darts and objects. They are used by the smiths and metal workers to blow the heat upon a piece of metal in the manufacture of metallic parts. Quite a good air-blast is possible with the device.

We next show the smooth surfaced bahooy wood, which is provided with a sappy interior, which is removed by means of pushing instruments through, resulting in effecting a very even channel through which darts and other objects may be blown. The native becomes quite expert with the tube. He can shoot straight and well. He can use great force with his wind, and manages to make the dart or clay ball reach its target. In figure 3 is another type of tube which is employed by the natives. I saw these in use by some of the Moro tribesmen of the island of Mindanao. A straight piece of the wood is chosen, and the bore made. Then a flanged piece is inserted to a rod A, as shown. The native inserts the object to be shot from the tube, in the head, and introduces the flange of the rod. A quick, sharp blow is made, and the object is sent out of the tube with speed to its destination. Of course, the natives make the ammunition more effective by applying poison to the points. They use poisons obtained from poisonous reptiles and woods.

The arrow tube gun is exhibited in figure 4. It consists of the stock of the piece being made of hard wood, with a boring burned through the barrel portion. A strong wood bow is adjusted to this stock as shown, and the native draws the cord with the arrow to be discharged placed as at B. As soon as released, the arrow shoots forward with considerable speed and force. Figure 5 is for the purpose of illustrating the wood plug ammunition sometimes used in the blowpipes. These plugs are loaded with a powder made of charcoal and saltpeter secured by the natives in the hills. The powder is placed inside the little piece C, and there is a fuse attached. The fuse is lighted and the projectile is blown forth by the native. It usually explodes far from its mark, and seldom does much damage, and is more of a Fourth of July display than anything else. Figure 6 shows one of the clay balls made by puddling clay and rolling in the palms of the hands to proper form, finally baking it. Some of the projectiles, made in the form of the one in figure 7, are shaped from clay, others from wood or metal. I saw some of these designed from stone. Figure 8 is a sketch of the dart plan. It is a hard wood piece, tipped with steel carrying poison. There are feathers arranged to guide the dart, as shown. Some darts are of the prick order only, as shown in figure 9, with a needle-like affair inserted. Many of the arrows used are fitted with heads of metal or stone, as in figure 10. The head sticks firmly in the flesh when imbedded. I saw some remarkably nicely decorated shooting tubes

in the possession of the sultans and chiefs of tribes on Mindanao Island. Figure 11 is an example. The tube is entwined with coils of wood, as shown, and these parts are all neatly smoothed and polished, with the result that an exceedingly good effect follows.

In figure 12 is a sample of one of the stocks of the tubes, showing engravings and gems placed thereon to the value of several hundred dollars. The natives of Jolo get oyster pearls, and a little silver is mined. These articles are utilized to decorate the tube head, as shown. The natives are very proud of these ornamented blowpipes. One of the most attractive blowpipes I saw is sketched in figure 13. When held up to blow through, the link at lower end drops down and the mouth can be adjusted closely to curved portion, where the bore is and the blast of air sent forth. The head is ornamented with a skull effect, the teeth of the jaws of which were said to be those of enemies who were slain by the poisoned darts blown from the tube. There were precious metal attachments, and fine polish, to add to the beauty of the pipe.

TRAVELER.

## Floating Down the Mississippi.

### VII.—A Cotton Town.

WHEN I reached Tiptonville I was fortunate in being directed to Mrs. Foster's, when I asked for a place to board for a few days. Mrs. Foster's house is a two-story one, with a front view to the north. A weedy field bounded on the far side by a many-strand wire fence, one post of which is a tall cypress tree, on which the last negro hung in town was lynched. Beyond is an old bend of the river—a place where the current used to come sweeping round sawing into the banks, but a few years ago a sand bar formed, and now green willows, and a streak of white sand are where the river flowed.

With the scenery different, and the weather strange, the tourist naturally expects to find another kind of people, and he is not disappointed. Likely enough he will find himself to be the oddest type of all, and his own land a curious combination of egotism, frailties, energies and versatility, such as he had never dreamed. A traveler who walks backwards, and keeps his glasses focussed on "home," is bound, sure pop, to see what he had never seen, and find what his dreams had never showed. It seems to me that the plainsman in the hills gets the best view of his own land possible, while an Adirondack stray in a cypress brake gets to know his own beech flats as never before.

As I was going over to Reelfoot Lake, bag and baggage sooner or later, I asked if there was a man in town who would carry my boat and duffle from the river to the lake. Mrs. Foster gave me the name, "Jim Miller," and over town I heard he had a gray horse in his team—last seen down by a cotton gin. I went that way, and found the gray-horse-team. But when I asked for Miller, a negro shunted me round the corner of the gin, asking as he walked, "Whar you gwin to carry Jim to?" Jim didn't show up at all, so far as I know, but one who "drives his team" took my stuff and volunteered the information that Jim was over at Reelfoot Lake.

I don't know at this writing that I have seen Miller since I got to town, but there can be no doubt that I was, for a time at least, a suspicious person from the view point of the darkies.

One is puzzled by the use of grease by southern cooks. They fry potatoes, and serve the dish, sometimes at least, so saturated that the bottom of the dish is half an inch deep with melted lard. So with meat and most other things. It was all I could do to keep Stevenson—with whom I came as far as Tiptonville from Kaskaskia—from putting lard on beefsteak "to soften it up." They fry bacon in lard sometimes.

I can account for the use of grease in such large quantities only by the fact that in the old days bears were very numerous throughout the Mississippi country. The bears were very fat, and this fat was tried or rendered out, and some of the hardier frontiersmen, at least, would drink a pint of the thin, sweetish grease at a draught. The grease and the meat of bears was one time exported from New Madrid in such quantities that the river at that point was called "Grease Bay," "L'Anse de la Grasse." And by similar historical antecedents, one may account for the use of knives in conveying food from the plate to the mouth, which for a long while has excited comment from travelers who came from regions with different or less pronounced traditions and customs. The men who opened up the cotton and corn lands of the Mississippi carried a big knife, with which they dressed their game and ate their meat. They had no forks, and complained that porcelain dulled the hunting blade. The test of friendship was to break one's knife in two when a comrade lost his. The fork is a comparatively recent table utensil, and its use as a shovel in northern communities is only less frequent than in southern.

One day I walked down to the lower landing at the river, and on my return was overtaken by a youngish, but weakened, withered little man in a buggy.

"I don't suppose up in your country you have such little, unhealthy kind of men like me, do you?" he asked in a tone of sickly dejection. Lake county chills and

tobacco from childhood had stunted him. One of the hardest sights I had seen, was a boy of eight or nine with a cigar as large round as my thumb in his lips, clutched with two fingers over the top, as he rode in a cotton wagon the sides of which came up to his shoulders, and I told the man it "seems like the tobacco gets used to young, don't it?"

"Shaw!" he exclaimed, more astonished than dissenting. Certain it is that there is a "right smart" of tobacco used in the region—in spite of mothers and their old buggy whips. To hear a boy of fourteen say "I can't stop it!" of smoking and chewing tobacco, is something to add a different feature to one's sensations. But the use of tobacco, and the features of chewing tobacco which fills so much space in books of travel written by foreigners before the war, is plainly not so bad now as then. But it is bad enough, especially as regards foolish and unfortunate little boys who, in their ambition to be men, do the things that usually prevent their becoming thoroughly manly, physically at least.

Type for type—clerk, merchant, politician, ex-soldier, the bearing of men in the South is on the average a bit more erect, and more direct in the gaze—seeming to indicate haughtiness in their natures, which more than anything else makes the tourist realize that he is in a part of the country different from his own.

A look beyond one's temporary residence quite verifies this difference. Tiptonville is a cotton town, and to one from a spruce bark camp in the Adirondacks it was a right interesting place.

One who approaches Tiptonville by way of any of the land routes—from up stream or down, or from Obion—is greeted by numerous advertisements nailed to trees and fences along the highways. As the place has no railroad, and the steamer landing is usually two miles from town—on account of the sand bar that has thrust itself across the town front—fortunately for the town's existence, one must see these insistent proclaimers of various wares. It is a surprise to see them—nowhere in New York State have I seen so many bill boards for a town of even 2,000 inhabitants, as this one which claims 1,000, as at Tiptonville. Advertising is said to indicate superior enterprise according as it wrecks the beauty of a scene—the more views a company spoils, the better its advertising department.

The big signs in the distance, too far to be read, quite hurt me, especially as they showed up against a cypress swamp of my dreams, and rendered some magnificent trees horrible around the trunks. I turned the other way as much as possible and passed them by unread so far as I could, but spite of me I came to know the names of the town stores in the order of their advertising insistence—which was the triumph of the advertiser, without doubt. And then, one day, I found myself walking a mile just for the sake of putting down in my note book "the readin' on some of the signs."

"So-and-So discounts all prices of any old house this side of New York!" "No mistakes in filling prescriptions—pure drugs!" "For good shoes go to —!" These are familiar enough in their form to a sign victim, except the first one, which shows a lack of economy in the use of space. Several words could be taken out, paint saved and the words rendered entirely commercial and uninteresting. But here is one without rhetoric which commands the attention of unaccustomed eyes:

"Buggies. At Walbell's Hardware and Furniture Company's. Stoves, Ranges, Coffins and Caskets!"

Someway or other, the advertisers no matter which the firm, always got the stoves and coffins in together. It's a novel sight to see coffins blazoned forth on a twenty by ten foot advertising sign, especially as it appears in connection with cotton fields, cypress trees, and the bottom lands of the Mississippi, where there is no horizon, but just the nearest line of trees for the distances, shutting a man in till he longs for a tall tree to climb, and a chance to see that blue which comes of forty miles of good air, not of six of miasmatic fogs.

The cost of living is very high—groceries must pay the steamboat lines which carry all the freight, "reasonable" fifty or seventy-five cents a hundred to bring them in, and profits, when the storekeepers are not at war, are high enough to be good livings for owners, even though stores are located every mile or two along the bottom roads. The negroes get fifty cents a hundred pounds for picking cotton, and pick from 200 to 700 (record) pounds a day—averaging two dollars or two-fifty a day. They work all the week and spend it all on Saturday "evening."

"A third of a cotton crop only," this year, has hurt the storekeepers proportionately. At intervals during the day steam whistles sound along the brick and wood shores there, and the stranger asking about the noise, is told it's a gin. In Tiptonville there are two gins, and in Lake county seventeen, two closed down. They pay 3 cents to 3.50 a pound for seed cotton. As the farmer comes in with 3,000 pound loads, and gets cash for his gin order at one or other of the two banks, it will be seen that "there's plenty of money 'round town." Most farmers are contented to leave their money in the bank, however, and do not take it out till necessary to pay the pickers on Saturdays, or their bills run up on credit during the planting season. It's easier to buy on credit—the cash is not seen in the actual process of going out till settling time comes, and not even then, for an

order serves as well—so people who have money are careless, and don't realize the value of it.

"They spend money here, they sure do!" Mrs. Foster used to say. One sees a store clerk with a hundred dollar diamond on his finger, throwing tobacco juice like a hoosier from the bottoms. The clerk can afford the stone, for he gets from \$30 to over \$100 a month right there in the Tiptonville stores. A boy of fifteen has received the \$30—the tobacco does not matter. In fact half a dozen or so of the young men in town had their photographs taken with large cigars between their teeth. This photograph excited some comment because it was "a right good picture."

The main street and the country roads were so hard when I saw them, that the cotton wagons—with big boxes drawn by mules, usually driven by a dark man who has a long leashed, short handled whip—rumbled along as though on macadam or on a bridge. They are ideal roads for wheelmen and pleasure riding, but in winter, "why, you just aint got no idea how deep that mud does get. People pays any price to have anything moved, and four mules on a light wagon gets stuck some days for hours at a time, not able to start it."

Winter is cold in Tiptonville—at intervals. The sleet storm two years ago left a coat of ice on the ground, trees, and everything, which lasted for six weeks, but mostly it's just mud. An old ex-parson said of last winter, that he didn't get off the sidewalks from middle November till late April, on account of mud. This is not so very unusual—any winter will have weeks and weeks of mud. And yet some of the moneyed people and all the others apparently in town, are reduced to the extremity of cutting down their shade trees—so necessary in summer heats—simply because they didn't have wood piles. When the roads are good no one thinks anything but cotton—and curiously enough, there is no regular coal dealer in town nor anyone to put a barge on the river to bring wood to town from the vast forests which line the banks of the Mississippi—and wood bringing \$1.50 an uncut, unsplit wagon load of swamp and drift pile pickings, and extra for putting the stuff into more or less regular lengths for the stoves.

Perhaps the thing that always strikes a northerner in such a cotton town—I have talked to many northerners who have come South and like its ways—is the simplicity of the life led by most people, rich or poor. They read the local paper, and perhaps a paper from the nearest city (Memphis, at Tiptonville), get cotton reports over the telephone—and get much of their enjoyment and sorrow just so—and perhaps take a long drive in a buggy behind lean, fast horses. One hears, "I'm often surprised at the immense amount of satisfaction that can be got out of a stick and a good jack knife." There are few signs of people being discontented, or given to wandering around, though having money enough to go as they please. Judge (that is his given name) Harris, with thousands of acres of cotton land out at rent, large banking interests, and a big estate to manage, and a young man, was the only one in Tiptonville who seemed entirely able to use all his time "doing something," as the expression is understood in the North. He takes photographs for recreation, and some of these are beautiful. Hobbies are rare in the valley.

The village is divided into two parts, one of which figures in the local papers as "Coon Town." The negroes furnish much of the local gossip, their doings being right interesting on occasion. The seven prisoners in the local jail are all colored, two being women. Two, a man and a woman, are waiting trial for murder—the man of his wife with a club, the woman her husband with an ax. One is a boot leg whiskey seller, one hit a man with a hoe, craps caused some fines, and the other woman was up for shooting a revolver for practice on a cane ridge.

The jail is a ramshackle wooden building with a right strong steel and iron cage within. Those fined with costs serve their sentences at the rate of forty cents a day, and the sheriff gets forty cents a day for caring for them. The food consists of seven biscuits, all beans he can eat, a piece of meat—hog, beef—molasses once, for each man daily.

Jailer Thorn is obliged to maintain discipline by such processes as buckets of water, holding back food and water, making a hot fire in the stove, and the like. About November 1, the jailer was awakened at 3 A. M. by the darkies singing and playing a French harp, or mouth organ. They wouldn't stop nor give up the harp. The jailer said either give up the harp or no water and grub. All day long the prisoners were riotous, but about six o'clock the jailer said he was going to take a little walk, and away he went. Two hours later he returned and heard one of those negroes on his knees praying:

"Oh Lord! Give me a little corn bread, and give me a little water which doesn't cost anything!"

"We got hungry, and we told him we'd do anything for him if he'd only give us something to eat," one of the negroes said.

"They are right witty," the jailer has to say of his men. It seems that they come to be riotous just because they want to break the monotony of days and weeks cooped in a space fifteen by fifteen feet. A prisoner who comes in without money or tobacco is tried by his fellows and whipped. Also if he does certain things which make it more uncomfortable for the others. Under compulsion they are obliged to keep the cell clean at Tiptonville, but in other jails this is not done. But personal cleanliness is not enforced—one yellow man had never bathed in his life—though cutting off food or water or both invariably fetches prisoners to terms. Three years ago a negro was taken from the jail and hanged by a mob, and two years ago another was taken from the court house by day, when a white jury disagreed. The jury was a "scrub jury," mostly strangers in the region, and of them one had been accused of the same crime, and another's son was similarly accused some time before, unknown to anyone in Lake county. When the facts regarding these two jurymen became known both left the country—under the impulse of notes delivered at night. A man was once killed in the jail by a shot in the night through a window as he went to bed.

Tiptonville has been burned out twice, and the houses are nearly all new and well painted—white. It is remarkably clean and neat, and shows that there is considerable money in town by the average standard of

clothes worn, and preponderance of the white collar contingent.

As Tiptonville is a river town, it has had its experiences with floods. Being on the same ridge that New Madrid is, water does not come to the houses, but, along the water front, the bank has been continually caving, and some of the houses have had to be moved back. A two hundred acre farm was once between Tiptonville and the river. The farm is gone, and one corner of the old warehouse at the very edge of the place is on the caving bank. Under the town flow streams of seep-water, and this causes a constant small wearing away of the water all the year around. The mail comes by stage 24 miles—by skiff in high water, for then the ridge is an island. They have their little shakers, and there are some things which lead to such expressions as "If I wasn't kept here by this or that I'd get away faster than you could talk." One time there was a negro hung at Tiptonville and he said his innocence would be proved by the town "sinking into the river." The caving banks, the rotten limestone under all, and the "little shakers" remind the old timers of various things. "We're living here," said Lockey Donaldson, one of the town's "big men" "but we don't know."

The river has brought a sand bar down before the town, a levee seems likely to lower permanently the height of Reelfoot Lake by stopping the influx of river water in high tides, and the earthquakes don't come so often as formerly. One can look at the sky, so to speak, and believe it isn't going to rain very hard anyhow—like Noah's neighbor, in the story they tell in the Mississippi Valley—where some parallel between local conditions and those of Noah's time is found.

To northern eyes, Tiptonville is interesting in every way. If one is a bit circumspect, and exercises some of his innate Sherlock Holmes ability, such things as the road crossings—beams with cross sticks nailed at stepable intervals—will indicate the mud to come if it is dry weather, the lean activity of the store keepers, their prosperity, the pretty eyes and taut carriage its romance, and the toot of the cotton gins its commerce. As a cotton town, perhaps Tiptonville is most remarkable of all. Lake county cotton is famous, and so I had a better chance to see a cotton town than I realized for some time after I reached Tiptonville. The gin brings the stores clustering around.

RAYMOND S. SPEARS.

## Twilight and Camp-Fire Clubs.

THE Twilight Club was founded in 1883, at the time of Herbert Spencer's visit to this country, when that great philosopher remarked at the dinner given in his honor at Delmonico's, that Americans "have had too much of the gospel of work, and need to cultivate the gospel of relaxation." The club was, therefore, organized to cultivate rational recreation, and the requirements for membership were to possess "a clean shirt and \$1 in pocket." The plan was certainly unique. There are no officers, no constitution, by-laws, rules, or regulations, but the club's affairs are managed by the perpetual secretary, Mr. Chas. F. Wingate, the sanitary engineer and founder of Twilight Park. Members come direct from their offices and sit down to dinner, usually at the St. Denis Hotel. The speaking begins promptly at 8, a different toastmaster presides on each occasion. The speeches are short and in the nature of shop talk. The following are some of the topics which have been discussed:

How did you earn your first dollar?

Should preaching be abolished by law?

What shall our boys do for a living?

How do the strikes strike you?

Have the Trusts helped or hurt you?

Why did you come to New York?

Have you lost faith in Democracy?

How would you spend a million for the public good?

Why don't people go to church?

How are you training your wives and daughters?

Should criminals be punished or reformed?

The club found many imitators, including the Sunset Club, of Chicago; Six O'clock Club, of Washington, D. C.; the Candlelight Club, of Denver, and the Present Day Club, of Dayton, Ohio.

On Thursday, March 10, the club held its 315th dinner, and a dozen members of the Camp-fire Club were invited to share in the discussion of the topic "Outdoor Life."

Among those present were Dr. Wm. T. Hornaday, President of the club, and Director of the N. Y. Zoological Park; Arthur F. Rice, the secretary; Dan C. Beard, the artist; David T. Abercrombie; Dr. C. C. Curtis, Professor of Botany at Columbia University; Capt. E. B. Rogers, Pay Inspector U. S. Navy Yard, Brooklyn; Dr. T. K. Tuthill, A. A. Anderson the artist and supervisor of the forest reserve at Yellowstone Park; E. W. Deming, the Indian painter; and T. E. Batten of FOREST AND STREAM.

Mr. Beard acted as toastmaster, and said that he had been brought up in Kentucky, "the dark and bloody ground" which was full of traditions of Daniel Boone, Simon Kenton, and Simon Girty, the famous hunters who preceded the trappers, and he had heard many stories in his childhood of their wonderful deeds. It was a common remark among the sturdy woodsmen of his day, that "the only thing on 'arth they feared was a painter and a rattlesnake." Doubtless in the primitive days of flint-locks and poor powder, an encounter with a full-grown panther was to be dreaded. He had always heard that even the grizzly is afraid of the mountain lion. He related several stories which he had heard from Yellowstone Kelley, about these "varmint." One of them carried off a good sized baby in his teeth, but could not climb the fence and so dropped the kid. Another one killed a hunter in a hand to hand contest, while a third followed a friend of Kelley for a mile and a half until the latter concluded that it was safe to shoot him. Mr. Beard himself met a woman out West, who was attacked by a panther while traveling with a dog. She had a rifle, but dared not shoot for fear of killing the dog, so she broke the lion's backbone with the butt of the gun.

Mr. Beard gave an amusing account of his experi-

ence in building a summer home in Pike county. The natives there had never seen a log house, and could not understand a builder's plan, so he had to whittle out a model with a jack-knife in order to show what he wanted. He left plenty of cracks for ventilation, and the house was quickly occupied by numerous families of flying squirrels. When he returned the second year his stovepipe was plugged solid for six feet with cotton tufts from the bed covers; the bed itself was full of nuts, and when his sisters started to clean house they found squirrel nests in his rubber boots, overcoat pockets, and even in his corduroy pantaloons. When the latter was shaken out the squirrels flew in all directions to the consternation of the house-cleaners. At another time he strewed pepper about in spots, thinking to rid himself of these pests, but was kept awake by their sneezing. He described his first encounter with a rattlesnake after sixteen years' failure to meet one of them. He also gave a vivid account of his travels in Yellowstone Park, and the delights of open air life in the far West, where the men are said to measure nine inches between the eyes, and smell like a wolf, but are genial and excellent company, men in short "with the bark on." He concluded by telling of the new lovers of nature who shoot game for food but not for mere love of butchery, and who regard the fad for collecting of deer heads and horns as but little better than the Indian collector of scalps.

In order to break the ice, Mr. Wingate led the speaking and told of some of his observations of animal life among the Catskills. He related a number of anecdotes regarding catamounts or "painters," black bears and porcupines in that section and in the Adirondacks. He referred especially to the wonderful leaps made by the catamounts, measuring as much as forty feet, as stated by Dr. Merriam. No wild creature was so feared by the Indians and early settler, or did such damage to colts, calves and sheep. Their mournful screams and stealthy mode of attack created universal terror. Bears are still common in the Catskills, and so are porcupines, though they do not strip the hemlocks bare as in other sections. He referred to the steady growth of appreciation of outdoor life, which began with Wordsworth and Thoreau, but has been mainly fostered in recent years by the writings of John Burroughs. Our methods of summering have entirely changed since 1870, and now camps, cottages, and parks are found throughout the length and breadth of the land.

Doctor Hornaday, managing director of the "Zoo" at Bronx Park, gave a delightful and breezy account of his observations as a naturalist and a traveler in South America and in the far West. He described an experience with a puma ("el Tigre," as the natives call them) in South America when he was hunting sloths. The panther was swimming across a river, and when they followed him in a leaky canoe, he deliberately tried to come on board. The situation was decidedly interesting, as Mr. Hornaday had no firearm, except a rifle loaded with bird shot. This wounded, but only enraged the beast, so he took to pounding him on the head with an ax, a difficult matter because his head sunk in the water each time he struck. They finally hauled the creature into the boat only half dead, and there despatched him. The speaker said he had always regarded the panther as not a dangerous animal. The attendants enter their cages at the "Zoo" without hesitation. The screams, despite Doctor Merriam, can be heard at all hours for the distance of a mile, and sound like the cry of a terrified woman, or like a magnified cat. Incidentally, he remarked that he had never seen anything so startling or so horrifying as the sudden attack of a male jaguar on a female which had been placed in the same cage. He leaped like a thunder bolt, and seizing her head in his powerful jaws, crushed it in a second.

Referring to the main subject of the evening, he said that outdoor life is the only antidote for our present automatic existence, when everything is done by machine methods. But to enjoy and benefit by such life one must have some object. A naturalist, as a matter of course, must love fine scenery, but a lifeless landscape has few attractions. He gave a graphic account of a trip to the Bad Lands and the Great Divide, where he rode hard, slept on the ground, climbed and hunted and fished continuously, and returned after a month's absence and a thousand mile journey, bringing back one pair of antlers as his spoils. But they were ample return for the time and trouble. The love of nature is steadily increasing, and outdoor life is a pleasure, as well as a necessity.

Mr. Arthur Rice, secretary of the Camp-fire Club, told of the first and only occasion when he had heard a panther scream, while night hunting in the Adirondacks. It sounded like the wail of a lost soul. His guide at once turned back to camp with the remark that it was no use going after deer that night, as they would all be hiding in terror. Emerson says every man contains a bit of savage as big as a woodchuck. We are wild men temporarily tamed; the instinct of flight and pursuit remains with many animals. The cow fears the dog, because her progenitor was afraid of the dog's wolfish ancestor. The dog turns around before lying down, and buries his bones from inherited habit. So sheep gather at night in a clump with their heads outside, and the buck rounds up the does and then carefully takes shelter in the midst of them. Hunting once meant life or death to the savage or the scout. The woods are our sane asylums. As soon as the first bluebird's notes are heard and the first robin, we are lured into the forest. Every boy wants to run wild at a certain time, and men are but children of a larger growth. The pleasures of outdoor life are threefold—anticipation, realization, and remembrance.

Captain Rogers, of the Navy, gave a detailed account of outdoor life in Japan, and described a delightful excursion with a party of pilgrims, dressed in Japanese costume, to the famous sacred shrine in the mountains of Niko, which are full of legends, beautiful buildings, and magnificent views. He gave interesting details of native customs and methods of trout fishing, and an account of the eclipse of the sun which he witnessed.

Mr. A. A. Anderson, who is in charge of the Forest Reserve at Yellowstone Park, told of the wonderful improvements which have been made in that locality. Mountain lions are so numerous and destructive there that it will be necessary to employ hounds to get rid of them, yet they are so stealthy, that the principal guide said he had not seen one of them in twenty years, though he was constantly coming across dead carcasses of animals which they had killed and partly eaten. Quite recently six colts and three young steers were thus made away with. The panthers usually leap upon their victim, and seize and hold it by the throat in their powerful jaws, and suck its blood until it dies. Referring to the forest reserve, he said that no spectacle is finer than to see the thousands of elk which roam at large with other game of all kinds. Some of them are wonderfully tame and remain close to habitations all the year round.

## Natural History.

### Eagle and Sturgeon.

WE had been camped for a few days at a point on the upper reaches of the Pic River, waiting for a few of the party who were running a side line. A source of amusement, was watching the descent of a large bald-headed eagle in the eddy back of the point.

He would strike the water with great force, coming down from an immense height. At times he would dive under the surface to reappear a moment or two later, generally with a fish clutched in his claws; when he would fly (freighted with his fish) to a very high mountain, on the overhanging crest of which the nest with his mate and young were quite visible to us with our field glass.

I had noticed his success and journeys to the nest for two mornings. On the third morning, a shadow coming across the sun's rays caused me to look up, and there was the great bird at his usual hunt to supply the young eagles with breakfast. With his keen eye piercing the river depths he poised over a particular spot for a few moments, and then shot down with the velocity of a cannon ball.

The waters parted and the eagle was lost to view. I watched and waited to see him emerge with his prey, but moments lengthened into minutes, and minutes into a quarter of an hour, but the surface of the water remained undisturbed.

What could it mean? Even if he had struck himself against some hidden rock and been killed, the body would have floated to the surface. It passed my reasoning powers to solve the result of that plunge. Then far down, fully a quarter of a mile off, I saw the great bird struggling, either to carry off a heavy burden or to free himself from one. The waters were lashed into foam, and the bird again disappeared, and all was still.

This lashing of the water and disappearing was repeated again and again, each time further down stream. A bend in the river prevented my seeing the final result. Calling one of our men from the tent, we embarked in a canoe and started down river to view the strange proceeding closer. When we had doubled the point below, I saw lodged against the beach in a small bay something that did not look natural to the place. We paddled down and found it was my eagle fast fixed to a sturgeon, fully six feet long. Both were motionless. The king of fish and the king of birds had met death.

MARTIN HUNTER.

### The Wonderful Chimpanzee.

From the London Field.

THE death of the wonderful chimpanzee Consul, which occurred in Berlin on the 20th inst., must be regarded as a misfortune from a purely scientific point of view. His intelligence, already far above that of most individuals of his species, was in full process of development, and, considering his age—only five—promised greater things had he been spared the fatal attack of bronchitis to which he succumbed after only three days' illness.

Those who have only seen Consul during his short performances at the Hippodrome cannot form an adequate idea of his intelligence. I took much interest in the ape on his arrival in London, and saw a great deal of him, on and off the stage, during the six weeks he spent here. He was extremely sensitive to kindness, and responsive to the sympathy of his friends. I shall not soon forget the screams of joy with which he greeted me when I visited him in the evening in his dressing room at the Hippodrome. Like all the higher apes, he was capricious and of somewhat unreliable temper, and if slightly unwell, or irritated at the presence of some person for whom he felt a dislike, he might show himself very savage, and even so much forget himself as to refuse to obey his master. But, as a general rule, he was extremely well behaved, obedient, and thoroughly enjoyed company. Both in Paris and in London he received frequent invitations to luncheon or dinner, when he would sit for over an hour at table without moving from his chair, eating almost of everything, with fork or spoon, and drinking wine or beer out of a glass without hardly ever upsetting a thing or soiling the table cloth. Dessert was, of course, most enjoyed, and he always greeted the appearance of fruit on the table by a sort of grunt several times repeated in rapid succession. Like other chimpanzees, he was very fond of bread, of which he ate several pieces in the course of dinner, always leaving the crust. He was very partial to strong drinks, and had a special liking for whiskey and soda, but smoking he clearly did not enjoy. He would take a few puffs just to please his friends, and would then throw away his cigar or cigarette, or pull it to pieces. On one occasion, as he was sitting on my knee, tearing up the leaves of a cigar, he arranged the fragments on the back of my hand with a symmetry that was not accidental. I several times tried to make him draw some simple design, as he was fond of using a pencil, but with no success; yet I cannot help

thinking that, given his power of imitation and his dexterity, something in this line might have been obtained with time and patience. Consul understood many words, even when spoken by total strangers, and he would recognize his friends among the crowded audience round the arena of the Hippodrome, interrupting his "turn" to rush across to them.

As has already been noticed in other anthropoids, he had a sense of the ridiculous, and would do certain things with the evident object of provoking laughter. One day that I had him to luncheon it occurred to me he might like to use a bell, as he was in the habit of doing at table during his performance, and I accordingly placed one, quite similar in shape to that which he used twice daily, by his side. But Consul realized that there was no necessity for calling a waiter when servants were standing in the room, so instead of ringing the bell he put it on his head, at the same time looking round to judge of the mirth which his jocular action produced on the other guests. He clapped hands when very pleased, and always after having done something which he thought deserving of applause. He was extremely fond of playing with people, romps up and down the stairs being a great treat to him, and when tired he would come in your arms to be nursed like a little child.

One of the most remarkable things about Consul's training was the system by which he had become so hardened as to go about—more or less warmly clad, of course—in all weathers, driving in a motor car or a hansom, without feeling any the worse for the changes of temperature. He washed with cold water, and I must not omit to mention, without entering into details, that his toilette on rising differed in no way from that to which we accustom our children. Unlike many human beings, he was fond of soap and water.

Of his public performances the most noteworthy part was his riding a bicycle, the steering of which around tables, chairs, etc., implies a degree of mental adjustment with which mute animals are not usually credited. Much in the details of his "turn" had been devised by himself, as, for instance, standing on his head, an addition to the programme which, I am told, he made recently in Paris entirely on his own initiative, and probably in imitation of some human performer at the Folies Bergères. It speaks for his intelligence, as distinguished from educability, that, unlike other trained animals, he hardly ever performed twice in exactly the same way. Sometimes he would refuse to go to bed after undressing, as was part of the regular performance, or he would get in at the wrong end, and he occasionally disgraced himself by making his appearance on the stage on all fours. His trainer never felt quite sure of what was going to happen. The way he could stand and walk perfectly erect for a long time was very remarkable, especially in view of the fact that not many years ago the possibility of chimpanzees doing so was denied, notwithstanding the statement of Buffon. The account given by the illustrious naturalist of the behavior of a trained chimpanzee, Jocko, exhibited in Paris in 1740, has been regarded by some authors as exaggerated; but as I have seen Consul do everything with which Buffon's chimpanzee is credited, I believe the account to be absolutely trustworthy, and it seems to me, from all I have read, that Jocko and Consul, following at an interval of 160 years, are to be regarded as the two most highly trained anthropoid apes that have ever been brought to notice. How many years will it be ere Consul finds a successor?

Chimpanzees, of which I have seen a great many, vary much in appearance, quite irrespective of differences due to age. Consul was an exceptionally handsome specimen, with hardly any freckles on his flesh-colored face, and a pleasant expression, especially when his eyes were bright with satisfaction. He was somewhat disfigured temporarily by having lost most of his milk teeth; the second dentition was just cutting through. His coat was perfectly black and lustrous, and I never noticed his hair to stick up when he was excited, as is the case with many individuals, particularly the young male Jimmy now in our Zoological Gardens.

I stated at the head of this notice that the loss of Consul is regrettable from a strictly scientific point of view. As the late Professor Romanes well said in writing on the mental faculties of the chimpanzee Sally, the confinement of these animals in menageries is not favorable for anything like systematic instruction, while the treatment to which Consul was subjected under the able care of Dr. Scott promised to bring out the full mental development of which the highest of brutes is capable, and of the limits of which we must confess to be still ignorant. The chasm between the mind of dumb animals and that of the lowest of men is certainly very deep, but how much so it would be premature to say in view of the rare opportunities afforded to the scientific observer. Such an opportunity the death of Consul surely removes for a long time to come.

G. A. BOULENGER.

### Bears as Game Destroyers.

BREWER, Me.—*Editor Forest and Stream*: If it will be of any help to those opposing protection of bears, I will say that in the fall of 1859 Mr. Wm. H. Staples (whom your correspondent Mr. Burnham mentioned several times when he wrote from Jock Darling's camp) found where quite a small bear had crept to a large bull moose with nine points on each horn, and had jumped on his neck and held him down till he killed him. There was a light sun and everything could be plainly seen; and Mr. Staples found him in less than twenty-four hours from the time he was killed. It was no wounded moose, as no one was hunting in the vicinity. I was hunting some twenty-five miles to the north, and Mr. Staples told me all the particulars when we next met.

Jock Darling once told me that in coming up a stream on Aroostook waters he found a she bear and two cubs feeding on a cow moose, which she had just killed by jumping from the bank upon her when feeding on lily-roots.

Among hundreds of moose hides I have had dressed by the Indians, I have seen several where hips showed great scars, where they had been torn by bears. These were not scratches made by being torn on knots, as one often sees, but showed plainly the marks of all the nails on both hips. But if more conclusive proof is desired, in Scrib-

ner's Magazine for September, 1901, is an article by Frederic Irland, entitled, "The Beguiling of the Bears," in which he tells of going with Harry Braithwaite on his spring bear hunt. On page 318 he says: "During the first few days of its life, the baby moose is a clumsy, helpless creature, that wabbles feebly on its long legs, and can scarcely get out of the way of a man, to say nothing of a bear. All the bears go moose hunting at this season, and any bear killed in May is almost certain to have moose hair in its stomach. Gene Hay and a few other trappers have decimated the bears and lynxes, and the moose have increased enormously." What is true of the moose is also true of caribou and deer. Bears can kill the young in May and June just as they like; and later can and do kill some old ones.

Our Legislature in their wisdom removed the bounty on bears as being a needless expense, and put one on the nearly harmless porcupines. I do not think the bear bounty ever was over \$2,000 in a year. Already we have vouchers which call for over \$12,000 for porcupines, and more damage is done by fires set to smoke them out than all the bounties ever paid on bears would amount to.

M. HARDY.

### Robins and the Garden.

SAGINAW, Mich.—*Editor Forest and Stream*: The Saginaw Courier-Herald some time ago offered a prize for the one reporting the arrival of the first robin. The result is that Thos. Londry, of Merrill, Mich., a town near here, reports having seen one on his farm on the morning of March 5. Mr. Sheperd reports seeing three a day later, and reports of several others follow on or about the same date. There is strong prejudice against the robin on account of their fruit-stealing propensities. My yard is filled with them, and I cheerfully surrender the product of three cherry trees to them each year. My strawberry beds I keep covered with mosquito netting from the time the berries first begin to turn. The bunches of my grapes I tie in paper bags. It makes some work, but the grapes are nicer and the robins cannot get at them, so that all through the summer my lawn is covered with these birds, and I think they are of more value than the few dollars' worth of fruit destroyed. Cherries can be had on the market, anyhow, for a song, and so can strawberries, and the robins are always willing to furnish an equally pleasant song.

I am afraid our quail have been exterminated by the severe winter. I have heard reports of several people driving along the road and finding dead quail lying on the roadside. The protection of birds and wild animals in a practical way is being delayed like the growing of forest trees, until the last one will be exterminated.

W. B. MERSON.

### When a Duck is Not a Duck.

I READ a few days ago in an exchange a description of a dinner partaken of by a number of Roman Catholic dignitaries—it was on a fast day in Lent—where teal duck was served at dinner.

The presence of meat upon the table excited comments from one not thoroughly posted, and the explanation given was as follows: That, like a turtle and a hen's egg, teal duck was neither fish nor meat.

Mallards were a grain-eating duck and their flesh was built up from the same foundation as a stall-fed beast. But a teal duck, living on minnows and lower forms of water life, was certainly betwixt and between, and neither one thing nor the other, and for this reason its presence upon the table during Lent was permissible. But whether it be fish, flesh, fowl, or the devil, a properly cooked teal duck is a morsel not to be sniffed at.

CHARLES CRISTADORO.

### An Oregon Rabbit Drive.

A CORRESPONDENT of the Cornwall (N. Y.) Local writes from Skullspring, Oregon: "I wish to tell the readers of the Local about a rabbit drive in which I participated on New Year's Day, at the mouth of Butter Creek, near Echo, Oregon. It is said to be the biggest drive ever made anywhere. A large corral was built with a wing three miles long, and about three hundred people to drive them in. It is estimated that about ten thousand rabbits were killed. Two coyotes were also caught in the drive. One thousand of the bunnies were used at the Echo Cannery, that being all that could be taken care of before spoiling. One man hauled away fifteen hundred for his hogs, and the remainder were left on the ground. The village hunters may think of this when they are tramping through the woods all day for one, or perhaps no little cotton-tail.—L. G. B."

### Destruction of Prairie Dogs.

MONROE, Neb., Jan. 17.—*Editor Forest and Stream*: I see in FOREST AND STREAM that Cabia Blanco in speaking of the prairie dog seems to think that it would be almost impossible to exterminate them. We have found it rather easy. There was a dog-town north and west of Columbus a few years ago, that was almost one mile wide by perhaps three miles long. There is not a dog left there now.

We used sulphide of carbon. We used to saturate a piece of corn cob in the fluid and drop it down the hole and cover the hole up tight and that was all. The carbonic acid gas would do the rest.

As to shooting them, I have killed as many as twenty in succession with a rifle, and not had one of them fall down the hole out of reach.

L. H. N.

Some centuries before our era there was a man who carved for his feudal prince a piece of jade into the form of a mulberry leaf. He spent three years over the job, and when it was finished the leaf was so perfect in detail—stalk, veins, and even hairy spikelets—that when mixed up with other mulberry leaves, no one could say which was the imitation. The artisan was richly rewarded; but the philosopher of the day is said to have remarked: "If God Almighty spent three years over every leaf, there would be scant foliage on the trees. Therefore," he added, "the wise man puts his trust in the processes of nature, and not in cunning or ingenuity."—Professor Giles.

# GAME BAG AND GUN

## Life in the Woods.

### VI.—The Old Trapper and his Bucks.

NORTH of Echo Lake there was a rough and rocky stretch of country about as wild as when only the wolf and the red man roamed over that section. Twice—and twice only—had civilization invaded it, and both times it was the lumbermen who ventured in. In the early seventies a small crew had cut off a limited amount of the best pine, but their work was scattering, and nature had so far resented the intrusion that in the last of the eighties the trees the woodsmen had left standing, as shown by the old stumps, had grown to larger proportions than the trees first cut had ever attained. Again the eager competition for pine had caused another invasion nearly twenty years after the first, but only forty acres of trees were sacrificed that time. On account of the distance, the rocks, and the high ridges, this territory for many years was shunned by the hunters, but gradually, as game grew scarcer, and the wary deer withdrew to this fastness for protection, we began to prowl through the ravines and over the rocky nubs, though every time a deer was killed there the whole party vowed they would never help lug another out of such a hole.

This spot was a favored one by the Old Trapper. There he could cover about an acre a day at his own gait. There he could prowl along the ledges or sit and sun himself on some rock and smoke his pipe in peace. There quietness prevailed, and, surrounded by dark forests, deep ravines, and in every direction high knolls covered with trees or brush, it was possible to commune with nature until nature tired you out. We went over there one day and in the little forty-acre chopping we saw the track of a mighty deer. It was fresh and it was a big fellow. It spread out in the soft dirt something like the hoof of a big heifer, and it cut in as if the weight of an ox impressed it there. That was all we did see. We climbed all those ledges and crawled through every ravine. We navigated the hills and took birdseye views of the country until our eyes were tired, but no game. We kept going until the warm sun made us sweat as we never sweat before, and until a gun felt almost as heavy as a railroad rail, but no deer. In fact, it was a case of "no nothing," excepting that track. In camp that night the Old Trapper was contemplative, and finally reminiscent. He told about all the big deer he had ever seen, and the tracks they made. He told about all the big deer he had ever shot, and just how he did it, and I verily believe when he slept that night he did nothing but dream about that big buck, for the next morning we had a drive planned in which all were to participate, and on which we rather banked for good results; but when ready to start, the Old Trapper said he guessed he wouldn't go out until later, and if he did go he rather reckoned he'd try and give that old buck a whirl. We urged in vain, and finally he admitted that he was after that big buck in dead earnest, and that he was going to get him, too. We went our way and he his.

It was a bright, clear day. The sun had just risen as fresh and smiling as any sun could possibly rise. The air was almost as balmy as a summer morning. The blue-jays squallied and screamed to one another. The woodpecker's call echoed through the woods, and the busy little red squirrels were chattering away on every side. The Old Trapper, by a trail well known to him, struck off straight for the home of that big buck. There was no noise over there save that made by the denizens of the woods. No echoing crash of gun, or call of man, or resounding clatter of the woodsman's ax disturbed the solitude. He reached the chopping and traveled all around it. He took several turns through the surrounding woods and around the swamps, but found nothing. He grew a little anxious, and searched more carefully for the buck, but not a fresh sign was to be seen. At last every place had been looked over and no encouragement at all received. He was about to give it up for that day as a bad job, and as he stood musing on a large log his gaze gradually centered on the highest knob in that whole section. It was stripped of every tree, and, save for some brakes and sweet fern, with an occasional sprouting pine, was apparently as bare as an egg. It towered above all the other points as the eighteen-story skyscraping buildings in the big cities overshadow their more unpretentious neighbors. It was about as large as the space occupied by two or three good-sized houses. Something moved the Old Trapper to think he had better go up there and look the country over. It was the only place where he had not been. He was tired. He was hot. His gun was heavy. He was a long way from camp. Would he go? Finally, hunter-like, he balanced a stick, saying to himself, "Whichever way it falls, I will go." It fell toward the mass of rocks. Even then he hesitated and hated to move, but finally, impelled by some unknown power, he started.

He reached the base of the ledge. What was that? Why should the blood go dancing through his veins as if he were only sixteen instead of sixty? He steadied himself and stooped to look closer. There it was—the mammoth track—and perfectly fresh, going up the hill, while close beside it was another track not quite, but almost, as large. The Old Trapper's old soldier instinct asserted itself. There was no indecision, no tremor, no excitement visible. Varying his course to work against the

wind, slowly he ascended. Oh, how slowly! From time to time he gently pushed aside the brakes and stooped to lay one side with careful hand every stick, twig, or leaf that threatened to betray him. Step by step he neared the summit. Now he was half way, now almost there, but nothing came in sight, and the weight of disappointment began to settle over him, when suddenly, with a snort and a bound, two large patches of gray sprang up six rods before him, one to the right, and one to the left. The gun swung quickly to shoulder, and bang! the echo was turned back from rock to rock until it seemed as if a whole battery of artillery was in action. Again and again the vicious crack. Smoke was all around him. All was still save the echoes of the last report. Did he have him? Who could answer until, slowly from the ground some thirty rods away, there raised a massive pair of horns and slowly disappeared, pulled down by the mighty hand of death. The Old Trapper had captured his big buck. That night in camp the boys opened a bottle of wine and celebrated the skill and luck of their old comrade in royal hunter's style. The deer weighed, when dressed and shipped home, 206 pounds. That came of having the right man in the right place at the right time. It was a fine piece of stalking, and the game was bagged after a fair and square combat between animal sagacity and human reason.

Perhaps it was the wine or the elation of success that loosened the Old Trapper's tongue that night, but at all events, before we turned in, he told us all about two other big bucks he shot on one trip, and about one he didn't get. The incidents concerning the latter were about as follows:

"We were hunting on the Poplar River that fall, and it was a new country to all of us and some way or other we didn't get the hang of it very good. There was too confounded much driving and a chasing around running through the woods. Why, they had it figured out how they were going to drive deer to such and such a place because they couldn't go nowhere else, and come to find out there was dozens of places along the route where a yoke of oxen could get through. I began to get pretty tired of running my legs off every day and one afternoon told the boys I guessed I'd look after my traps, so I started off up creek. Bimeby I come to a little ridge where the sun shone good and warm and thinks I to myself, 'I'll sit down here a minute and have a smoke.' So I gets out my pipe and fires her up. Now you fellows may laugh all you please, but the deer pays no attention to tobacco smoke, not half so much as they will to our camp-fires. Well, I sat there, having a pretty good time, when all of a sudden I see the bushes wiggling down in a little hollow to my right, and next thing out walks a nice big buck. He stood there rubbing his head in some bushes while I takes careful aim. Bang goes the old gun and down goes Mr. Buck and lays as quiet as a little lamb. Well, thinks I, 'that's a pretty good job after a week of no luck at all.' That's good enough for another smoke, so I puts down the old gun, fills up the old pipe again and fires her up. I had a double barrel gun, one barrel rifle and the other buckshot. I had fired the rifle and had put the gun down without reloading it. I felt pretty good just then and sat down and admired the big deer. I says to myself 'I'll go down and bleed and dress him and then I'll go to camp and get the boys to come out and carry him in,' as our camp was only half a mile away. I figured he'd weigh 190 pounds or thereabouts and allowed he was as handsome a deer as I ever see. I sat there several minutes and was just knocking the ashes out of my pipe when that buck commenced to wiggle and then to thrash around. I made a grab for my gun and by the time I got it to my shoulder the cuss was up and climbing through the brush as if nothing had ever happened to him. I let go the buckshot at him, but he was too far away. First I felt awful bad. Then I thinks, 'what will the boys say?' and I rather guessed I wouldn't tell them anything about it. Then I made up my mind that the old fellow couldn't go very far, so I hurried back to the camp and got the old hound Sport we had with us and put him on the track. He ran about quarter of a mile or so and then stopped barking. We never found the deer, and though we thought some other hunter did we were not able to prove it. If it hadn't been for the old pipe I'd have of had that deer killed and hung up a dozen times. Why I could have walked down and cut his throat or killed him with a club if necessary. You bet when I get a deer down now I get to him just as quick as I can, and I don't mind wasting a cartridge or two either to insure a good job."

The two bucks that he did get were both shot at the "Gorge." One right in the "Gorge" and the other just a little outside. One weighed 175 pounds dressed and the other 198. They were both very fine deer.

Our party had done very poor shooting that fall, and though individually we had a goodly number of opportunities, yet we had not bagged much game. The end of the hunt was near at hand, there being just two days left, so we all vowed a mighty vow that we would kill some deer, but the Old Trapper was the only one whose skill counted for aught, and he had nearly given up when on his way to camp he got a long running shot and knocked a buck down in his tracks. He fell right on the bank of the Pembine, so we rigged up a raft, tied the deer on it and started the outfit adrift down stream. It went along pretty well except now and then it grounded on

the rapids and shoal places, and when this occurred the Old Trapper waded in though the ice was forming and pulled it off. It was a hard job just the same and we were not anxious to repeat the experience. The next day we all went out again, but had no luck excepting the Old Trapper. He had been up the creek and around Beaver Lake getting in a line of traps he had out for otter and mink. He had secured the last one and fastened the whole bag full on his back and was on his way to camp. On reaching the "Gorge" he was tired out by his load and seated himself on a log with his back to a tree to rest and smoke. As he was sitting there up walked a big buck and passed about six rods away. A quick shot through the shoulders settled him in short order, though he staggered around a good deal knocking down a lot of small dead trees and covering the ground with blood. On holding a consultation at camp it was decided to get him out the same way as we did the other, so all that afternoon we worked to carry him to the Pembine, build another raft and float him down stream. As he was a heavier deer he grounded oftener, giving us much more trouble, but as the team was coming for us the next day we had to get him out. These two shots made the Old Trapper the undisputed champion of that hunt.

As our old comrade had done so well on this particular day in killing the big buck alone and in a fair and square hunt, and that too after he had openly declared his intention of going after him, we opened another bottle of wine and all drank to his health once more, after which we honored him still further by doing his share of the work in preparing for the next morning, by bringing up the water, getting in the wood, whittling the kindlings and getting the coffee, meat and potatoes in readiness for breakfast. Then one by one we sought our bunks to sleep and dream. Some to rest in the complete unconsciousness that fatigue and perfect health brings, and some to toss and dream of what they would do if only they had a chance at such a deer, or perchance to lie awake for a time, listening to the sounds of the night, and to wonder what was going on in that different and seemingly so far distant world where dwell the loved ones, and from which in the complete isolation of the wild woods one seems at times so widely separated.

CAROLUS.

[TO BE CONTINUED.]

## Destruction of Alaska Big Game.

BILLS introduced recently in Congress looking toward the repeal or modification of the Alaska game laws have naturally aroused much interest among big-game hunters, and have brought out many comments as to the different species of game found there, their abundance, and the rapidity with which they are being killed.

It has generally been believed that in southeastern Alaska the small Sitka deer are enormously abundant, and that there is no danger whatever of their extermination by hunting, since the natives kill them almost altogether by shooting from canoes on the water.

Definite testimony on all matters connected with the preservation of Alaska big game is much to be desired, and we print herewith copies of two private letters recently received by a gentleman in this city which have a direct bearing on the subject:

MADISON GRANT, ESQ.—Dear Sir: In answer to your request, I am writing to you a few details about the destruction of game in Alaska by the natives.

It seems that all the Indians have an overwhelming desire to destroy animal life, no matter what the nature of the animal is, be it either fish, flesh, or fowl.

Whenever we were camped near a salmon stream, and my men wanted some amusement, they would gaff quantities of salmon and throw them upon the bank to die. When I remonstrated, they simply answered, "There are plenty more left."

While after mountain goats, I met a party of three adult and two young Indians who were packing up portions of the carcasses of sixteen goats that two of them had killed that morning. They had, however, killed more than sixteen, as I counted eighteen carcasses myself that I actually found. In one pile among some granite boulders I found three dead goats that were untouched with the exception of one hindquarter that had been cut off.

The following day I found several more carcasses about a mile further on that had been killed some time before, as they were much decomposed. These were killed in August or even July.

While hunting on Admiralty Island I found the carcasses of several deer that had been killed and left untouched, and it was always difficult to keep my men from shooting them whenever they saw them.

One Indian was sent out to get one deer for some miners. In about two hours he came back with a deer slung over his shoulders, and said he had five more, mostly fawns and does, upon the mountain side. These could not possibly be used, as the weather was very warm.

Another Indian whom I met in Yankee Cove wanted to join my party, and as a recommendation told me he had killed fifty-four caribou one morning.

The moose, too, share in this same wasteful slaughter, and it is a singular fact that the larger he is and the finer his horns the more pleasure they find in destroying him.

Another thing I would like to speak of is the destruction of caribou for the soldiers at such places as Fort Eagle and the posts along the Yukon. There the United States Government hires men to slaughter them by the hundred. One man I heard, and on very good authority, killed 129 animals in one day. Now, it seems that this slaughtering might be done away with, as plenty of food can be brought there by steamer by way of the Yukon River and the White Horse Railroad.

As I told you, I am going back to Alaska this summer, and I will try to get the names of any people, Indians or whites, whom I find killing animals needlessly.

GOUVERNEUR MORRIS PHELPS.

MADISON GRANT, ESQ.—*Dear Sir:* It is astonishing how so many people think Alaska is overrun with deer. In the first place there are very few, if any, on the mainland, as the wolves kill them at once. Then on the islands they are comparatively scarce. I never saw more than six in one day's hunt, and sometimes for a week I would not see one at all. About Wrangell Narrows there used to be great numbers. Now they have been largely killed off by the Indians for their hides, which are sold at twenty-five cents each.

The deer seemed to congregate along the edge of the salt water in the thickest timber, and were killed by the thousand by the natives, who ran them down in the snow and cut their throats.

One white man told me that he counted over four hundred carcasses in a short time—that is, a few hours. This has been stopped, as there is no longer any sale for the hides, but too late, as there are very few deer left.

The deer about Juneau are a myth. Here, like all the rest of the mainland, there are no deer. In all the tramping through the woods that I did I never even saw a deer track.

As to the game law, it is absolutely useless, except that it prevents the exportation of any part of the animals killed. Most of the Alaskans, Indians or whites, do not even know the existence of a game law, and were very much astonished when I told them there was one. Anyway, I think they would have very little respect for it.

GOUVERNEUR M. PHELPS.

The statement made in Mr. Phelps' letter do not at all agree with the observations on Indians made by other travelers in other parts of the continent. The Indians of the western plains and mountains did not commonly kill wantonly nor greatly waste food.

While they were always willing to kill, so long as there was any profit in the killing, and while they might destroy a thousand pound elk for a \$1 skin and often let the meat waste, it was not their practice to destroy game for mere pleasure. The whole practice of the older and the wiser men in the tribe was against such waste, and they constantly warned their people against it. They realized that they depended for food on the game, and usually they killed what they needed for present and future consumption but no more.

On the other hand we have the testimony of more than one Alaska hunter that their natives did kill apparently for the mere pleasure of killing. If such an unusual state of things exists in Alaska it may be attributed to the influence of, first, the Russian, and, later, the American inhabitants of the country.

### New Brunswick Guides' Association.

THE annual meeting of the New Brunswick Guides' Association was held at Fredericton on Wednesday, March 2. The president, Mr. George E. Armstrong, of Perth, occupied the chair, and there was a large attendance of members, all important game districts of the Province, being represented. The president reported that the past season had been a very successful one for the guides; the number of non-resident sportsmen was 25 per cent. greater than the previous year, and they had met with much better success. The guides had steady employment the greater part of the season, and many of them already have engagements which will keep them busy a good part of next fall. In regard to the association he was glad to report that its membership was steadily increasing, and the chances were that before long every competent guide in the Province will be enrolled. The president was also pleased to report that during the season a moose had been killed in the Province with an antler spread of 67 inches, which, in his opinion, breaks all records for this continent outside of Alaska.

The election of officers for the ensuing year resulted as follows: Honorary President, L. B. Knight, Chief Game Commissioner; President, Arthur Pringle, Miramichi; Vice-President, W. Harry Allen, Little River; Secretary-Treasurer, Robert P. Allen, Fredericton; Executive Committee—Sydney Thomas, G. E. Armstrong, Charles Cremin, and the president and vice-president. Committee on Membership—Adam Moore, T. H. Pringle, Fred H. Reid.

The membership fee was reduced to two dollars, and the date of the annual meeting was changed to the third Wednesday in December.

It was announced that arrangements had been made by a number of the guides to handle bear hunting and fishing parties during the months of May, June, and July, and that a number of engagements had already been made for these months by American sportsmen.

Satisfaction was expressed with the game law as it stands at present, and all were of opinion that there should be no increase made in the non-resident license fee.

The members seemed to be strongly of the opinion that the Government should adopt more stringent measures to prevent the slaughter of deer and moose in mid-winter by local pot-hunters, several flagrant cases having lately been brought to their notice.

After an informal discussion on game matters in general, the meeting adjourned at midnight.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

### To his Guide.\*

Quite grateful for the bounty there,  
Provided by their hostess fair,  
Her welcome at the eventide,  
And parting speed ere morning's ride,  
Sportsman and guide left Maple View,  
In sight of Tobique's waters blue.  
How oft recalled, the faithful team,  
The traveled way, the river's gleam,  
The ford, the halt on further shore;  
The portage—twenty miles or more,  
By rock and flood, through woodland brake,  
O'er mountain range to Trouser's Lake.  
Here virgin forests stately grew,  
The haunt of moose and caribou,  
And then at length in greenwood's glade,  
Sportsman and guide their rude camp made;  
There happy hours—too quickly gone—  
Suggest the day a moose was won.  
That morn they looked the landscape o'er  
From wooded island's bush-clad shore,  
'Neath cloudy skies, o'er waters dark,  
The while a quarry failed to mark.  
They thought perhaps their calls at dawn,  
(The life-like lows from birch bark horn),  
Might fall, within the forest near,  
Upon a moose's listening ear,  
And the roused stag no longer shy,  
Boldly come forth with answering cry.  
"Hark! Do I hear the looked-for sound?"  
Exclaimed his guide, while turning round;  
"A moose I see! Look, yonder, there!  
Watch as I point and you'll see where!"

"Already glorying in his prize,  
Measured his antlers with his eyes."

The sportsman glanced beyond the wood,  
On wat'ry point the quarry stood,  
Now still and like a statue there,  
A noble beast, superb and fair.  
"Tis not so large as some I've seen,"  
Whispered his guide; "'Twould do, I ween."  
(As now along the lake they flew,  
In swiftly gliding birch canoe),  
"Take pains and point your rifle right,  
(Two hundred yards!) Adjust its sight,  
Steady your aim and feel at ease,  
Hold low! The trigger gently squeeze."  
The watchful sportsman gave full heed,  
Leveled his piece, now drew a bead;  
And as the dark stag tossed its head,  
Swift to its life the missile sped;  
In vain it strove, a hummock near,  
With pawing hoof the knoll to clear;  
Then, rearing, threw its muzzle high;  
Next, with a crash, they saw it lie  
Just on the marge, where mosses green  
Formed bier—more gorgeous never seen!  
The shallop beached, they gained the strand  
And o'er the quarry hand in hand,  
By lakeside and the forest there,  
'Mid autumn foliage rich and rare,  
With heart elate now stooped to touch  
The game they coveted so much.  
The moose magnificent outspread,  
The long lithe limbs, the antlered head,  
And graceful form with coal black sheen,  
Made picture fair for sportsmen's een.

That day is past, but trophied shield  
Remembrance of the scene doth yield.  
Time hath not made the legend there  
On carved plate a jot less fair;  
E'en muzzle broad and pendant gland,  
With neck and mane appear as grand  
As when the monarch nobly bore  
His crowned head on laky shore.  
Though larger horns may grace his wall,  
And ornament the sportsman's hall,  
No antlered prize he'll deem so good  
As that which fell beyond the wood.

\* \* \* \* \*  
Glad greetings go with friendly lay  
To all who try the forest way!  
May mem'ry green good luck recall  
And trophies won adorn thy hall!

WILLIAM DEHON KING.

\*Alexander Ogilvy, Jr., South Tilley, Victoria County, New Brunswick, Canada.

†The antlered prize was the sportsman's first moose.

Note.—The horns of the moose referred to above, spread 29 inches, and the entire head is a very beautiful one. Two days after this moose hunt, which occurred Sept. 22, 1902, the sportsman, in company with his excellent guide, Alexander Ogilvy, Jr., of South Tilley, N. B., had the further good fortune to shoot a large caribou. A single shot was fired across a lake with a .45-70 Winchester rifle (black powder shell), sighted for 300 yards. The bullet pierced the animal's spinal column and brought it to earth. The antlers, which spread 27 inches, measure in length respectively 36 and 37 inches from hair to tip. W. D. K.

### Shooting from the Highway.

From the Pioneer Press, St. Paul, Minn., March 6.

Ole Johnson persists each year during the open hunting season in "camping down" in the road which runs across the Lamprey preserves, near Forest Lake, and shooting the game birds when and where he can get a shot.

Mr. Lamprey finally brought a suit, asking the court for an injunction forbidding Johnson from his pot-hunting, and to the complaint in the case Johnson demurred, saying that he was on a public highway, and could not be doing any damage to Mr. Lamprey by his shooting, inasmuch as Mr. Lamprey did not own the birds, which were wild.

Judge Lewis to-day filed an order overruling the demurrer and granting leave to the defendant Johnson to file an answer.

The case must be a novel one, for neither court nor council could find precedents applicable to the facts.

Judge Lewis' memorandum is, in effect, a piece of sporting literature, which will be read carefully by all the hunters in Minnesota and adjoining States, as it discusses, more especially the situation in popular, rather than in technical language. The judge says:

"Plaintiff is the owner in fee of a large tract of land lying in one body, and containing more than 1,300 acres, in the counties of Washington and Anoka, in this State.

"There are many private lakes and waters upon this land, and also two large bodies of water of about 600 acres in extent, which produce and furnish large quantities of wild rice and food for aquatic fowl. None of these waters are meandered, but all were actually surveyed, sold and patented as Government lands. Over certain of these grounds and waters many wild ducks and water-fowl regularly pass in their flight, and these locations furnish sportsmen with many opportunities and privileges of shooting during the open season.

"Plaintiff acquired these premises as a game preserve, and for the purpose of possessing and enjoying the advantages of pass-shooting, and to this use these premises are especially adapted by nature; and to this end plaintiff has expended some \$20,000 in the erection of suitable buildings and accommodations, and the only substantial value of the premises consists in the maintenance and enjoyment of the pass-hunting privileges thereon. During certain seasons of the year, wild duck and water-fowl congregate in and upon these waters and make them their natural resting and feeding places, and in their flight back and forth over certain locations furnish opportunities to hunters of marksmanship called pass-shooting, the pleasures and benefits of which are generally considered of great value, in this case admittedly greater than \$50,000.

"A public wagon-way or road runs through the tract, which, though never dedicated or condemned for such use, has to some extent been appropriated by the public for travel, for many years, without objection on part of plaintiff, who is the owner of the fee in the adjoining lands.

"The wild game before referred to, in their flight to and from the waters on these premises, frequently pass across the highway at certain points, and defendant, against the express wish of plaintiff, for a long time in the past during the open seasons has been in the habit of going upon the highway at this point and shooting at the ducks and fowl passing in their flight. This shooting frightens away from plaintiff's premises the ducks and water fowl thereon, and deprives plaintiff of shooting privileges and interferes with the enjoyment of the premises.

"Upon these admitted facts, is plaintiff entitled to relief against defendant by injunction?

"The answer to this question involves two propositions:

"First—What are the rights of a person making use of a public highway for shooting privileges?

"Second—What peculiar loss or injury does plaintiff suffer as a consequence of such use?

"Plaintiff is the owner of the land intersected by this roadway, which has become a public highway by use, and not by virtue of any statutory proceedings. Plaintiff is the absolute owner of the soil therein, subject only to the right of passage in the public and the incidental right to fit it for such use.

"Subject to this easement, plaintiff can enjoy and exercise all the usual rights and remedies of the owner of a freehold. As Justice Foster well says in 10 Burr. 122:

"The owner of the soil has the right to all above and under the ground, except only the right of passage by the king and his people."

"This principle excludes defendant from any use of the road at this point, except for the purpose of passage and the rights incidental thereto.

"The admitted facts in this case clearly show that defendant does not use this highway principally for passage, but does use it primarily for a shooting ground.

"This is not the case of a boy or man who takes his gun and walks into the country for recreation and occasionally gets a shot at game while walking along the highway. On the contrary, defendant, during the open season of every year, willfully and regularly goes upon certain portions of the highway wholly within the limits of plaintiff's preserve, and with full knowledge of the large investment made therein by plaintiff, and of all the surrounding conditions, and of the consequences of his action, defendant insists upon the right to use the highway at that point as a shooting ground, and persistently shoots at all game birds passing over the road in their flight to and from the waters upon plaintiff's land, and by this conduct frightens and drives away from plaintiff's land and waters the wildfowl, and thus destroys the pass-shooting thereon, and the value of the grounds for pass-shooting privileges.

"It needs no more than a statement of these facts to convince even the layman that defendant, in persisting in such conduct, contrary to the express wish of plaintiff, is making use of the highway at this particular point on plaintiff's land primarily for a shooting ground, and not for the purpose of travel. Such use is not conferred upon the public by the mere easement to use the road for public travel.

"But such wrongful use does not entitle plaintiff to pursue the remedy of injunction, except upon a showing of some special or peculiar injury to plaintiff. And the question follows: What special injury does plaintiff suffer by reason of defendant's conduct in this respect?"

"It is admitted that plaintiff has invested large sums of money in these premises and that their chief value consists in the shooting privileges thus afforded. It is also conceded that by reason of the natural advantages and conditions existing on this land, ducks and wildfowl congregate there in great numbers during the open season, and when unmolested they make these waters their natural resting and feeding places, and in their flight from place to place upon these premises they furnish peculiar opportunities to the hunter for shooting, and it is also admitted that the advantages and benefits thus afforded of pass-shooting on these particular premises are of the value of \$50,000 to the plaintiff. It is also admitted that the shooting by defendant on the adjoining highway frightens away these wildfowl, to the serious damage and injury of the pass-shooting privileges thereon.

"But defendant contends, and it is unquestionably the law, that no person has any right of property in wild game, even upon his own premises, until he has reduced it to actual possession by killing or taking; and defendant urges that plaintiff cannot be damaged in respect to the wildfowl on these premises because plaintiff has no property interest in these birds, and, further, because the defendant being in the highway has committed no trespass on plaintiff's lands.

"While the principles of law stated are undoubtedly correct, they have no application under the facts in this case.

"These premises are chiefly valuable not for the game thereon, but for the shooting privileges. They afford unusual opportunities for the enjoyment of the sport called pass-shooting. It is a matter of common knowledge that wild ducks are peculiar in this, that in their flight from one feeding ground to another, as well as in their migratory flights, they quite uniformly fly or pass over certain places and pursue certain lines day after day and season after season, and such places, when well defined and established, are termed by hunters 'duck-passes,' and it is not uncommon for persons to pay large prices for land that has no other value than the opportunity it affords for the enjoyment of so-called pass-shooting. By reason of the natural conditions and products of plaintiff's premises, wildfowl of this description gather there in great numbers and when unmolested and not disturbed by defendant fly within easy range over certain passes on plaintiff's premises, and so furnish unusual opportunities for the indulgence of shooting privileges; and the enjoyment of this privilege is not necessarily dependent upon the ability of the hunter to reduce the game to possession. These duck-passes furnish shooting privileges not found elsewhere. These privileges are dependent upon the waters and feeding grounds and upon the conditions peculiar to these particular premises and surroundings, and in this sense are natural to the land and constitute a valuable property right that runs with the fee, and defendant has no more right to go upon the adjoining highway and persistently shoot and deliberately injure and destroy this privilege of plaintiff than he would have to maintain thereon some unheard-of device that would accomplish the same purpose. In either case, he infringes upon a valuable right incident to plaintiff's enjoyment of the fee in his land, and for this reason should be enjoined."

## In North Carolina.

RALEIGH, N. C., March 4.—*Editor Forest and Stream:* The writer has referred to the fact that the Audubon law has been excellently enforced in most of the post counties in North Carolina, particularly in Currituck and Dare, where the duck shooting is of the greatest importance. In Dare county the killing of ducks at night by fire lighting has been completely stopped, but daring and dangerous residents of Carteret county have continued to conduct this illegal shooting of wildfowl, threatening to kill persons who interfered with them. The game wardens first appointed there failed to do their duty, but a new one has been put in authority who has lost no time in making arrests. Using a very swift naphtha launch, he ran down and captured two fire-lighters in Core Sound, having caught them in the act. These men are now in jail at Beaufort, and will be tried. The local officials there failed to enforce the law. Not many persons were engaged in fire-lighting, and several of them were known. It is expected that these arrests will stop the business. The men will be probably both imprisoned and fined.

The game warden for this (Wake) county has been doing considerable special duty in other counties during the past sixty days, having been in fifteen or twenty, and inspecting shipments from various junction points on the railways in search of contraband game. Secretary Pearson, of the State Audubon Society, got wind of the fact that some northern sportsmen in the counties of Richmond and Montgomery were adopting a new trick in getting partridges out of the State—that is, using the mails. Warden Upchurch has returned from a trip in both those counties and finds that in Richmond county fifty-nine licenses have been issued this season to northern sportsmen, and that two or three of the latter have been shipping partridges north by mail, placing the birds, two or three, in empty shell boxes. The sportsmen have now gone home. The whole matter has been laid before the United States Commissioner here, who will co-operate with the State authorities in enforcing the law.

Mention has been made of the fact that Game Warden Weatherly, of Guilford county, uses a very fine setter dog to aid him in spotting partridges shipped under disguise as all sorts of things, the warden and the dog visiting the trains at Greensboro, and the dog nosing out the birds no matter whether concealed in packages of butter or what not. But now comes a gentleman who says that the dog is all a bluff—that Warden Weatherly has had the tip as to the contents of the packages, and that he simply takes the dog along. The dog is right there, how-

ever, and is as much interested in the business as his master, no matter whether the latter has had the tip as to the birds or not. At Tarboro the young lady who is in charge of the local express office has certainly used a dog for two seasons to find birds. She was a pioneer in this business, since Warden Weatherly only began this winter. At Tarboro there is a very strong club of sportsmen, which really controls the whole county. In that county no birds are sold, the sportsmen forbidding this. In other words they go out and shoot, and anyone who gets license, coming from another State, is given liberty to shoot, but birds must not be shipped out, nor must they be sold. A bird seller is simply barred. This brings up the fact that there are a great many sportsmen in this State who would be glad to see the Audubon law so amended as to prohibit the selling of partridges. This selling certainly promotes pot-hunting, and the writer has heard of men in the vicinity of Raleigh whose only purpose is to kill the greatest number of birds, no matter whether they shoot them on the ground or not, and who will destroy the last bird in a covey. One restaurateur here has sold more than 8,000 partridges this season, these being bought from professional hunters or from farmers who make quite a business of hunting during the game season. The farmers are becoming exceptionally fine shots, and it requires crack sportsmen to keep up with them. There are plenty of farmers in this county who think nothing of killing forty to fifty birds a day, bring them in here and selling them for 12½ cents apiece, that being the standard price this season.

## "It Just Happened So."

SEVERAL years ago while at Stilwell, Indian Territory, in the interests of the United States Biological Survey, a man called at the hotel and offered to guide me to a cave where I would be able to collect some bats. Half an hour later we were on the way. The trail led through a broken country covered with heavy oak timber. Wishing to secure a few flying squirrels, I hammered on the trunk of every hollow tree that we passed, hoping to scare one or more of the rodents out.

Finally one launched into the air, but before I could shoot, it glided to another tree, and, running up the bark, entered a hole. All our efforts to force it from its hiding place failed, so my companion suggested that he shoot a ball from his Winchester .44 into the tree a few inches beneath the cavity, to which I consented. Still the squirrel obstinately refused to appear; so I climbed the tree, and, on putting my hand into the cavity, pulled out the warm body of a full-grown gray squirrel. The rifle ball had pierced the thin shell of bark and wood, and entered the animal back of the shoulder. On turning my hand and reaching upward, I touched the flying squirrel, which darted past my fingers and out of the hole, only to meet its death a few seconds later by a charge of fine shot.

Again, while collecting specimens at the foot of Mt. Otis, in the Bear Paw Mountains of Montana, I set a steel trap for a ground squirrel, and as they are small animals, I simply drove the staple to the trap into the hard ground. Further on I set another trap in a well-worn cattle trail; this I fastened securely, intending it for foxes. That night a skunk, while prowling about, got caught in trap No. 1, pulled up the staple, and, following the path, trailed the chain across the pan of trap No. 2, which sprang it, and the following morning I found the skunk a captive in two traps, set fully half a mile apart.

OWEGO, N. Y.

## New Mountain Goats.

It has long been recognized by hunters that in the white goats there is a great variation in size. Many adults are killed which are very small, and on the other hand, now and then one may come across a perfect monster, which seems two or three times as large as the ordinary ones. This difference has recently been recognized by Dr. J. A. Allen, of the American Museum of Natural History, who separates the forms of white goat into three geographical races; one from the Cascade Mountains; a much larger form, with a longer and narrower skull, from British Columbia; and a much smaller form of the same type of skull as the last from Montana and Idaho. In all the forms, the coat is white, and the animals look substantially alike, so that the distinctive characters must rest on size and the form of skull, for the present.

These forms are distinguished as follows:

Size medium, skull broad: *Oreamnos montanus montanus* (Ord.).

Size large, skull narrow: *O. montanus columbianus*; new sub-species.

Size small, skull narrow: *O. montanus missoulæ*; new sub-species.

The material on which the two sub-species are based consists of nineteen specimens; three from the Cascades, seven from British Columbia, eight from Montana, and one from Idaho.

## Lost Island Shooters.

MARSHALLTOWN, Ia., March 10.—Messrs. D. W. Norris, Jr., and Dr. Kibbey, members of the Lost Island Duck Shooting Club, left here to-day for the shooting lodge at Lost Island Lake, near Ruthven, to prepare for the other members of the club who will follow later, when the flight of the deep-water ducks begins. Among those who are practically certain to spend a few days at the shack are H. P. Densel, C. P. Cook, Charles Hull, L. C. Abbott, and possibly a few other Marshalltown members and Wm. Allington, of Webster City, Ia.

The Marshalltown shack at Lost Island has long been a fixture. From a small beginning, it has grown into a comfortable shooting box, capable of accommodating a dozen shooters comfortably. A sleeping box is being added this spring, fitted with bunks and wash-stands.

Lost Island is a famous ducking place, and usually affords sport, if any lake in northern Iowa does so. The Marshalltown sportsmen rarely return empty-handed from Ruthven. Their system is an excellent one. Their outing lasts there a fortnight or longer, and during this time there is certain to offer two or three days of rapid shooting. Last year's bag was satisfactory to the shooters who stayed it out, and the water this year promises good sport.

MOSCRIP.

## Good Old Black Powder.

THE following interesting communication was recently received by the E. I. DuPont Company:

POTSDAM, N. Y., Feb. 24.—*DuPont Powder Company:* Dear Sirs—I have in my possession some DuPont powder that was bought about fifty years ago by my uncle and grandfather. They owned two rifles and did lots of shooting, so they bought a considerable quantity of powder and stored it in a large stone heap on my father's farm at a safe distance from the building. Uncle took to fever and died; grandfather never shot much more and died not long after; my father was no gunner, so the powder, or portion of it, was left until about fifteen years ago I went and dug it out. There was a large flat stone over the box, and about two dozen ¼-pound cans—round cans, I think, with an Indian's picture on each one. They were badly rusted. I picked the rusted can from around the caked powder, broke it up and sifted out the dust, leaving the powder looking quite natural, but for some red grains that showed the rust. I saved four pounds. I never tried it till last fall I loaded .38-72 shells with it, and some with some DuPont bought recently. The old powder shot fully as strong as the new.

Yours truly,

W. A. CLARK.

## A Coon Hunt in which the Coon was the Hunter.

At a certain Adirondack cottage last season something disturbed things frequently. A jar of butter set under the house to keep cool, was broken into; a tub of beef in process of corning was robbed; a jar of suet on the back piazza was tipped over, broken, and some of the fat eaten; and many other depredations of like character committed. Several times the robber had been seen in the evening by ladies of the family, and to them he looked so big that the male contingent determined to watch for the thief and stop his thieving. Opportunity came one moonlit night.

Seen through a window and stretched over a pail in the shadow, the animal looked big as a half bushel. But he could not be shot just there, and so the broken jar of suet was placed in the moonlight in range of an open window, and gun in hand, the avenger waited. He did not have to wait long. Quietly and with great dignity, as though entirely within his rights, Mr. Coon came out of the woods again—right along the path to the house—and stopped to regale himself with the suet, so easily found in its new place.

Accounts were squared when the shotgun spoke.

JUVENAL.

## A New Lake.

A REMARKABLE phenomenon is reported from the Russian rural commune of Schava, in the Government of Tzareff Koksaka. Inexplicable sounds were heard for several days issuing from the earth. The sounds varied from something like the booming of cannon to the screeching of steam whistles, and seemed to come from a forest skirting the commune. In this forest, where the terrified peasantry gathered in expectation of some calamity, the earth was seen to heave incessantly. Gradually huge cracks appeared, water was seen, at last the earth seemed gradually to sink, water rose, and there appeared a new lake of considerable extent, which is now being examined by geologists.—St. James's Gazette.

## Legislation at Albany.

ALBANY, March 12.—The following bills amending the fish, forest and game laws have been introduced in the Legislature: Senator Stevens' (Int. No. 982), amending Section 176 so as to provide that special protectors may, when they hold the Commission's certificate that they are regularly employed by a board of supervisors or an incorporated society for the protection of fish and game, have the same power and right of search without a warrant as regular protectors.

Assemblyman Bedell's (Int. No. 951), amending Section 75 so as to allow the use of scoop nets in Walkill Creek or River in the town of Walkill, Orange county.

Assemblyman F. C. Wood's (Int. No. 950), amending Section 172 so as to increase the annual compensation of protectors to \$600, with \$600 for expenses.

Senator Goodsell's, amending Section 75. (Same as Bedell bill, above.)

The Senate has passed the following bills:

Assemblyman Reeve's (370—623), amending Section 101, so as to provide that deer shall only be taken between one-half hour before sunrise and one-half hour after sunset on the first two Wednesdays and the first two Fridays after the first Tuesday of November, and that possession between Aug. 31 and the first Wednesday after the first Tuesday in November, and between the second Friday after the first Tuesday and the 20th of November, shall be conclusive evidence of a violation of this section, unless it appear that the same was lawfully killed within the State, or was killed without the State.

Assemblyman Reeve's (438—477) amending Section 158 relative to renewals of leases of oyster lands.

(The last two bills are now in the Governor's hands.)

The Assembly has passed the following bills:

Assemblyman Coutant's (390—1011), amending Section 27b so as to provide that the close season for grouse, woodcock and quail in Orange and Ulster counties shall be from Dec. 16 to Oct. 15, both inclusive.

Assemblyman G. H. Whitney's (791—876), amending Section 87, subdivision 9, providing that perch shall not be taken in Saratoga county from Feb. 1 to May 1, both inclusive.

Assemblyman Hanford's, amending Section 59 so as to provide that bullheads, catfish, eels, perch and sunfish, and excepting the months of March and April, pickerel, may be taken through the ice with hook and line and tip-ups in Cayuta Creek and tributaries and the Susquehanna River and tributaries, Tioga county.

The Senate has advanced to third reading Senator Elton R. Brown's bill (472—535), amending Section 2 relative to prescribing a method for acquiring land and water for State fish hatchery purposes.

The Assembly has advanced to third reading the following bills:

Assemblyman Chanler's (870—1080), amending Section 86 so as to allow the taking of suckers through the ice in Crumelbow Creek, Dutchess county.

Assemblyman Cowan's (518—579), amending Section 31 so as to provide that there shall be no open season for Mongolian ring-necked or English pheasants, except in Suffolk county, prior to 1910.

Assemblyman Matthews' (687—807), amending Section 44 so as to provide that the close season for lake trout shall be from Oct. 1 to April 15.

Assemblyman Patton's (611—1063), amending Section 20 so as to provide that wild duck shall not be taken in Erie and Niagara counties from April 1 to Oct. 15, both inclusive.

The Senate committee has reported the following bills:

Assemblyman J. T. Smith's (293—518), providing that there shall be no open season for deer in Dutchess and Columbia counties before Sept. 1, 1908.

Senator Townsend's (15—15), adding a new section, to be known as Section 10a, requiring non-residents to procure licenses before being permitted to hunt deer.

Committee's bill (Senate), relative to the boundaries of the Adirondack Park.

## Fly-Fishing Near New York.

FIFTY years ago sport of any description had small place in the thoughts and lives of the American people; in fact, the word was seldom used except to express something "fast," and not to be encouraged. Now we are becoming a nation of sportsmen and sportswomen, and are all alive to outdoor amusements and recreations. The benefit resulting from this change in public sentiment is perhaps more marked in the women than in the men, as very possibly it was more needed. No one of mature years can fail to have marked the increased stature and healthfulness of our women. The ideal heroine nowadays is far removed from the wasp-waisted, die-away creature of the early portion of the last century. The girl of the twentieth century is a fine upstanding woman, with a flat back, large frame, and the limbs of a Juno. This article, however, has to do not with angels but with sport. The taste for this once acquired becomes inherent in the blood, and must be gratified or serious loss to health and happiness will result. We have much to be thankful for in this country, but it behooves us to look to the future, as well as to enjoy the present. We must be provident or the outlook for the "coming race" will be poor indeed.

Since the time of Walton, great numbers of the best and wisest men have evinced a love of fly-fishing amounting to a passion, and the increase in the votaries of the sport in recent years has been in the nature of a geometrical progression. There are one hundred fly-fishers now where one was found fifty years ago. When the breath of spring is in the air a kind of *heimweh* or homesickness seizes them; they must be off, if only for a few hours, to the fresh, clean, chilly country, where as yet not a leaf is to be seen upon the trees. The real season for sport comes a little later, but this first rush into troutland is a fine thing after a long cold winter like the one we have just experienced. It starts the blood in all one's veins, shakes up the liver, and is an antidote against spring fever. Only a minority of the great army of anglers can hie away to the lakes of Maine or the salmon rivers of the Dominion; the preserves of Long Island and the mountain streams of New York must receive the great majority. The demand upon these waters has thus become very great, and they would long ere this have proved inadequate if the genius of modern fishculture had not stepped in to fill the breach.

We have good spring trout fishing within a short distance of New York city, but the facilities for sport, and the size and number of fish can be largely increased if all the natural advantages of the country are fully developed. We may even have a season for fly-fishing in the autumn, such as we hear of as being enjoyed elsewhere. There are many good streams in the East, but for the purposes of this article, we will confine our attention to a few nearby waters, and perhaps make one or two suggestions in regard to them. They are easily reached by two lines of rail, and the region through which they flow is visited annually by thousands of health and pleasure seekers. We refer to five well known historic streams, having almost a common source, but flowing on widely diverging courses, three being tributary to the Delaware and two to the Hudson River. These are the Esopus and Big Indian, the Neversink, Willowemoc, and Beaverkill. The first two are practically one, the Esopus being formed by the junction of the Big Indian with a small brook called Birch Creek, a short distance from Big Indian station. The big Indian has its source away up in the mountain of the same name, the highest peak in the Catskills, and within a few yards is a small trickle of ice cold water which is the beginning of the West Branch of the Neversink. The East Branch rises a little east and south, and the Willowemoc north and west, as we remember the points of the compass, and the sources of the Beaverkill are not far away. All these are ideal trout streams, and will well repay the lover of nature as well as the angler. All are clear, cold, and pure, the water of the Neversink being as limpid as air, the smallest object can be seen distinctly at a depth of many feet.

Ten or twelve years ago the native brook trout—*Salvelinus fontinalis*—was master of all the brooks in this section, as they met all the requirements of its somewhat fastidious fancy, but now—chiefly owing to the wisdom and liberality of the State of New York—we have several varieties, all beautiful and sport-giving fish. Even at an earlier date (i. e., more than ten years since), the rainbow trout of the West (*Salmo irideus*) had found a congenial home in the Esopus and thriven amazingly, thus affording good fly-fishing where formerly there was little or none. I am referring now to the lower part of the river. It is claimed by some fishculturists that the rainbow trout can live and grow in water of too high a temperature for many other members of the salmon family. The brown trout (*Salmo fario*) has usurped first place in the Big Indian. This is the common European species, the trout of the British Isles. It is hardy and prolific, and within the last three years has greatly increased in the lower Esopus. The rainbow is still most abundant in this portion of the river, at least until the second falls is reached. Below these the black bass has, I am informed, taken possession. The Beaverkill holds brook, brown, and rainbow trout, but only a few fry of the last named have been released in it. The

same may be said of the Neversink, and the stock of the Willowemoc consists, or consisted very recently, almost entirely of native brook trout above Livingstone Manor. Clubs and individuals have released many fry and yearlings in these waters, and the Ontario and Western Railroad has carried millions of fry, besides giving transportation to parties engaged in carrying young trout from the State hatcheries.

Modern fishculture can satisfy all demands made upon it by fair fishing, and the development of the brown trout, principally from fry, has been very remarkable. A few years ago a pound trout was considered to be quite a large fish, and in an experience of many years the largest native trout we took from any of these streams was 16 inches in length and less than two pounds in weight. Since the introduction of the brown trout, two to three pounds is not uncommon, and many much larger fish have been taken. All pure tributaries of the Delaware and Hudson should swarm with trout. Brooks that have been barren for years may be made productive. The lower portions of the Beaverkill and Neversink are noble and beautiful rivers, and should afford more sport than they do now. We believe that the rainbow trout would do well there, and possibly the European grayling. Our own Michigan grayling seems to be a delicate fish, and is reported to be almost extinct. The foreign fish of this species must be hardier, as it flourishes in England and on the Continent in streams inhabited by large trout

THE FALLS OF THE ESOPUS.

and even pike. It is said to seek the lower portions of trout streams, and the same is reported of the rainbow trout. The latter has certainly done this in the Esopus, as it is found where there is plenty of water for a 30-pound salmon, and where the temperature rises high in summer. Both these fish are spring spawners (although the rainbow seems to be somewhat irregular as to time), and if they flourished together delightful sport could be enjoyed in the autumn, when weather conditions would be most favorable.

July and August were formerly good months for fly-fishing in the streams we have mentioned, as they flow at considerable altitudes, but until the season of 1903 our mountain summers, though very pleasant, have been warmer than of yore. Climatic changes are going on all over the country, the rainfall is less evenly distributed, and the streams get lower and warmer. The last season was all that we could desire in the matter of rainfall after the first of June, but we have had a number of very serious droughts in recent years. In fact, we have been experiencing some of the inconveniences felt in the United Kingdom from modern drainage, forest destruction, and the like. Thirty or forty years ago much of this region was a sea of hemlock; more snow fell and it remained longer, having more protection from the sun. Now deciduous trees have replaced the evergreen forest, and the appearance of the country is greatly changed. It must have looked a wild and savage region one hundred years ago.

The fishing has had many ups and downs. In the days of the first settlers the trout were only too abundant, but we believe that sport is better now than it was thirty years since. Tanneries were located on nearly all trout waters, and log driving and lumbering were constantly going on. There were but few trout below the tanneries, and though they fairly swarmed in the small brooks they were trifling in size and could have afforded but little sport. We have had sufficient experience of this kind of fishing, and have a poor opinion of it.

We wish that all Eastern anglers could have good fishing for the rainbow trout, as there appears to be a slight prejudice against this fish. We know of no better game fish. It leaps again and again when hooked,

and rushes madly down stream. Lying usually in heavy, swift water, it takes every advantage of the situation, and requires all the angler's skill to land. Mr. Fred Mather had a high opinion of the rainbow for sport, and also as a table fish, and Herr Jaffé, the well-known German fishculturist, has expressed himself strongly in its favor. It has been established in some of the rivers of New Zealand, where it reaches a weight of six pounds, and the fishermen in that country are enthusiastic in its favor. We think it resembles the Atlantic salmon more closely than any other trout. The head is small, body round and plump and very silvery when in good condition, as it almost always is. We never saw any traces of spawning in the month of May except in fish of 15 inches and over. A few of the large fish were thin and the vent a trifle pronounced, but the great majority were in good shape. We have taken them in August as hard and solid as blocks of marble. With this fish and the European grayling in the lower portions of our trout streams and native and brown trout in the upper and middle reaches, sport would be vastly increased.

On first consideration some objections will appear to a fly-fishing season in the autumn months, but these will be found to be more sentimental than real. The brown and brook trout will be working up into the small brooks and on to the spawning beds, and the few taken would be promptly returned. They could not be exposed, and but few persons would care to retain them for food, as, being out of condition, they would soon after death become slimy and unpleasant objects. The rainbows and the grayling would be in the highest possible condition and afford the very best of sport. The season in Colorado runs to October 31, and there are many brown trout and some brook trout in that State now. In Oregon it is said that the big rainbow trout do not come up from the sea until the month of July.

Grayling were introduced into the Scottish Tweed and Clyde from England years ago, and have become abundant in those rivers. We should consider all proposals or suggestions bearing upon an increased supply of game fish, and there are miles of the Beaverkill and Neversink that might be greatly improved. The European grayling and the trout do well together, or in the same river, and there is no good reason why our season for fly-fishing should be so short. With scientific fishculture and good management there is no need to fear that our streams will be depleted by any amount of fair fishing. Dry summers, ice jams, and great floods in winter and fall are the dangerous features in the situation. All good members of the brotherhood of anglers who love to be quiet and to go a-fishing, do all that they can to increase the stock of game fish in our streams and lakes—particularly those species which will rise to the artificial fly. There are many other streams besides those mentioned which are easily accessible from New York city, and we know of no pleasanter way of spending the summer vacation than rambling from one to another, casting one's flies as the spirit moveth. It is easy to travel cheaply all over the region we have referred to. You can go in by way of the Ulster and Delaware and return by the Ontario and Western Railroad. If not in a great hurry, one can travel by the mail hacks which run from Big Indian to Claryville, and thence to Liberty. In fact, these mail hacks will be found making their daily pilgrimages in every valley, and up and down nearly all these rivers. Claryville is on the Neversink, at the junction of the East and West Branches; over the next divide is the Willowemoc, and in the valley beyond flows the beautiful Beaverkill, which many people consider one of the most perfect trout rivers in this country. A large portion of the water is posted, but by staying at various farm-houses and summer resorts, enough fishing can be had to satisfy a reasonable person. In the early season good sport is had in the lower reaches in free water. In July and August the angler must seek cooler water far up the stream. Good luck.

THEODORE GORDON.

## The Rod in Picture.

PERHAPS many of the readers of FOREST AND STREAM have seen a painting by a German artist depicting a studio, a full-length portrait, boots and all, of Bismarck, on the easel, the artist with palette and brush in hand standing by, and squatted in front of the painting studying the boots with a look of grave perplexity is the village cobbler, who has just returned the mended boots of the artist, which he holds in his hand.

There is something about those boots in the painting that no doubt interest and apparently surprise the cobbler. He has seen and mended many pairs of footwear during his long lifetime, but never, evidently, had he seen a pair of boots just like the ones in the painting. And the artist, because of the demeanor of the cobbler, shows both interest and irritation—interest to know why the boots so exclusively interest the man, and irritation because the cobbler can see nothing but the boots in the painting.

Now, it is fair to presume if that artist was a wise man, and not pig-headed and conceited, that he found out about those boots, and received and followed some advice that he was wise enough to follow, so that when the cobbler again saw that painting exposed in public he paid no further attention to the boots, because they were now,

like any other boots, right, and so he spent his time admiring and adoring the features of the great Bismarck.

Now as to rods. How often do you see depicted in the illustrated journals a picture of a trout stream. Everything is right about the stream—no blackened timber, no right-angled log-jams, raw or otherwise; no shingle, no sound of shod canoe-poles coming round the bend, no hemlocks or smoky, silent Indian in evidence, and no red gods except may be that the angler has been throwing a red-ibis. So, as far as the stream goes, peace and harmony prevail. The angler is correct from the wader immersed to his hips to the felt hat well hooked with convenient flies.

But the rod! Oh, ye gods and little fishes! The rod is correctly drawn, because, no doubt, the artist had one in front of him in his studio. But the bend! And the handling! From under the shelving rock where a tugging, rebellious, and obstinate trout is having it out with the lure, the leader comes. The strain on the fragile rod must be terrific, for, if one's eye does not deceive, it is but a 3½-ounce rod. Is the angler giving the trout the butt? No, my readers! With his right hand grasping the rod butt close above the reel, he grasps the butt joint well up near the lower ferrule of the second joint with his left hand!

You put the picture out of sight and mind and turn over to the next illustration. It is positively painful. You can't stand it. Something is going to give or break or snap while you are even looking on, and, fearful lest you may hear the profanity, you turn your head away.

A. B. Frost don't make breaks of this kind. It is safe to say that he fishes, and shoots as well, and he knows, and puts flesh and blood and action into his pictures. Looking at one of his illustrations is like looking at a perfectly dressed woman. The *tout ensemble* is so perfect that five minutes afterward you could not minutely describe any one part of her apparel. So with Frost's pictures. You give one look, and mentally transfer yourself into the person of the gunner or fisherman, and are doing it all over again. And when a man makes you do that, it's art, that's what it is. CHARLES CRISTADORO.

## Fly-Fishing—Wet and Dry.

BY DR. JAMES A. HENSHALL.

WHILE fly-fishing, wet or dry, is unquestionably the highest branch of angling, and far preferable to bait-fishing for trout, it does not follow that fishing with the dry, or floating fly, is a superior art to fishing with the wet, or sunken, fly, as claimed by some of the dry fly-fishers of England.

Judging from recent communications on the subject in the English sportsmen's journals, the ultra dry fly enthusiasts have arrogated to themselves the distinction of practicing the most artistic and sportsmanlike method of angling, and look askance, if not with disdain and contempt, at the wet fly-fishers, whom they designate as the "chuck and chance it" sort.

I cannot think that the position they have assumed can be justly maintained, or that it is warranted by the facts of the case. As dry fly-fishing is being taken up by a few American anglers, it may be well enough to give the alleged superiority of the method some consideration.

Some years ago the *modus operandi* of dry fly-fishing was explained to me, personally, by Mr. William Senior, editor of the London Field. The angler waits beside the swim until a trout betrays its presence by rising to a newly hatched gnat or fly, creating a dimple on the surface. The angler then, kneeling on one knee, having a knee-pad strapped on, cautiously casts his floating May-fly, with cocked up wings, anointed with paraffine or vaseline. The fly is deftly and lightly cast, up-stream, a little above the swirl of the trout, and permitted to float down, as naturally as possible, over the fish. There being no response after a cast or two, the angler again awaits the tell-tale evidence of a trout before again offering the buoyant lure.

Now, if I have stated the case correctly, I cannot imagine why this method is claimed to be on a higher plane of angling than the "chuck and chance it" method. Certainly a knowledge of the habits of the trout is not essential, inasmuch as the angler makes his cast only on the appearance of the fish.

It seems to me to be akin to the practice of shooting pheasants with the help of a beater. The gunner, on one side of a hedge, does nothing but wait for the flushing of the bird by the beater on the other side, and at its appearance he bangs away.

Now, if it should be claimed that this plan of shooting is on a higher plane of sportsmanship than beating a stubble or turnip field with well-trained setters or pointers, one can readily see why dry fly-fishing is also thought to be on a higher plane of angling than wet fly-fishing, for the methods pursued in each case are somewhat analogous: The shooter waits until the bird is dislodged by the beater, while the angler possesses his soul in patience until a trout shows on the surface.

On the other hand the real sportsman, with some knowledge of the habits of his quarry, works over the ground with his dogs, selecting such places where he knows from experience that the game "uses," until the covey is pointed. He takes as much, or more, real pleasure in the working of his dogs and the exercise of his bird knowledge as in shooting the game when flushed.

So the wet fly-fisher, wading down-stream or up-stream, brings to his aid his knowledge of the habits and haunts of the trout, and casts his flies over every likely spot where his experience leads him to think a fish may lie. It is this eager expectancy or fond anticipation with every cast that makes up much of the real pleasure of angling, and which is utterly lost to the dry fly-fisher, who waits and watches on the bank like a kingfisher on his perch.

While there can be no objection whatever to dry fly-fishing, *per se*, and which, moreover, I welcome as a pleasing and meritorious innovation, I feel compelled to enter a protest against claiming for it a higher niche in the ethics of sport than wet fly-fishing. And with all due respect for the dry fly-men of Great Britain, I cannot admit that they trot in a higher class than those "chuck and chance it" fishers of honored and revered memory—Sir Humphrey Davy, "Christopher North," and Francis Francis.

## New Jersey Lake Rights.

Decision of the New Jersey Court of Errors and Appeals in the Swartswood Lake Case.

THE right to fish in an inland lake of New Jersey cannot be separated from the ownership of the lake and taken under the power of eminent domain, because, first, the natural supply of fish therein is so small as to be incapable of meeting a public demand; and, second, the object of acquiring such a right is, not use, which implies utility, but mere sport or pastime.

Query: Is the value of such a right capable of estimation, so that a compensation may be awarded therefor which shall be just with respect both to the private owner and to the public purchaser?

C. D. Thompson and Charles L. Corbin for plaintiff in error. Messrs. Griggs and Harding for defendant in error.

The opinion of the court was delivered by Dixon, J. "An act to acquire rights of fishing common to all in fresh water lakes in certain counties, to acquire lands adjoining thereto for public use and enjoyment therewith, and to regulate the same" (P. L. 1901, p. 333), declares that, in any county of the State wherein are fresh water lakes having an area of water surface exceeding one hundred acres, a commission may be appointed which shall have power to take in fee or otherwise by purchase, gift, devise or eminent domain, and to maintain and make available to the public the right of fishing in such lakes. Under this statute a commission has been appointed in Sussex county and is attempting to take by eminent domain the right of fishing in Swartswood Lake, which belongs to the plaintiff in error. The plaintiff resists this attempt upon the ground mainly that the power of eminent domain cannot constitutionally be exercised for the stated purpose.

In olden times the eminent domain seems to have been employed only in cases of State necessity, and there is no instance of its exercise in New Jersey prior to 1776 except for highways; but undoubtedly its scope has been much enlarged in recent times to meet the advance in social conditions. *Scudder v. Trenton Del. Falls Co.*, Saxt. 694. Still, even as late as 1852, Chief Justice Green spoke of the objects for which the State exercises this power as being few in number. 3 Zab. 357.

Under our State Constitution (Art. I, par. 16) private property can be taken only for public use. Whether the end sought to be attained by the taking is a public use is a question to be determined by the courts, although it is said there is a presumption in favor of a use declared by the Legislature to be public. *Mills Em. Dom. S. 10*; *Lewis Em. Dom. S. 158*; *Scudder v. Trenton Del. Falls Co.*, Saxt. 694, 727; *Olmsted v. Morris Aqueduct*, 18 Vroom, 311; *Nat. Docks R. R. Co. v. Central R. R. Co.*, 5 Stew. Eq. 755, 764. The language of the constitution does not authorize property to be taken "for public enjoyment" or "for public purposes," or generally "for the public." Its expression is "for public use," which implies an idea of utility, of usefulness, not necessarily inherent in the other phrases mentioned.

The duty is, therefore, devolved upon this court to determine whether the object to be subserved by the condemnation of the right to fish in the plaintiff's lake is a public use.

In order that a use may be public, it is not essential that the whole community should be able directly to participate in it. Thus, a free school for children is for a public use, although only a fraction of the community can attain it. But it is essential that the utility should in a substantial measure concern the public, as, for example, the education of the young concerns the community.

The right to be condemned under this statute is merely the right to fish. Such a right is in the ancient legal French called a right "profit a prendre," a right so peculiarly for personal enjoyment that it is incapable of being acquired by the general public, either by custom (*Cobb v. Davenport*, 3 Vroom 369) or by dedication (*S. C.*, 4 V. 223; *Albright v. Cortright*, 35 V. 330). No doubt there is a public right of fishing recognized by municipal law; it exists in the waters of the ocean along the coast and in the arms of the sea, as far as the tide ebbs and flows. But this right differs from that now under consideration in several important respects. In the first place, it is a mere incident of the public ownership of the public waters, while the object of the present proceedings is to sever the right of fishing from the title to the lake and give it an independent existence. If the Legislature had provided for the condemnation of the lake, so as to confer upon the public the right of restoring thereto for all purposes to which it is adapted, the condemnation might then have been supported on the precedents which find a public use in parks, and the right to fish would have passed as an incident of the public title; but under this statute the ownership of the lake is to remain private. In the next place, the natural supply of fish in the public waters is practically inexhaustible, if the right to fish therein be subjected to such regulations as will reasonably guard it from the free enjoyment of the general public; but the natural supply of fish in the inland lakes of New Jersey is so small that if the right to catch fish therein were exercised by persons sufficiently numerous to be deemed the public, the supply would soon come to an end. Lastly, fishing in the public waters has from time immemorial constituted an industry fostered by law for the supply of the general market, while fishing in private waters has been and can be only for individual amusement and gain. We think, therefore, that for present purposes there is no substantial resemblance between the common right to fish in public waters and the right now in question.

I turn then to the consideration of the matter in view of the rules which have been laid down as aids in determining what is a public use within the meaning of this provision of the constitution. A definition of the phrase has not, I think, been judiciously attempted, but among the statements of the doctrine to be found in the books, that of Prof. Cooley seems most likely to subserve the general welfare for which the constitutional power is delegated, and at the same time to pro-

tect private property, which is equally a ward of our constitution. He says (Const. Lim. 553), "The reason of the case and the settled practice of free government must be our guides in determining what is or is not to be regarded as a public use; and that only can be considered such where the Government is supplying its own needs, or is furnishing facilities for its citizens in regard to those matters of public necessity, convenience or welfare which, on account of their peculiar character and the difficulty of making provision for them otherwise, it is alike proper, useful and needful for the Government to provide."

Applying this as the test, the present statute cannot be supported.

The right to be enjoyed under this statute is necessarily the right of each individual who exercises it to abstract from what is designed by the statute to be a common stock such portion as he can secure, and to appropriate that to his own benefit. This is for private, rather than public advantage. The statute does indeed contemplate the acquisition of the common stock by public agents, but they are to acquire it for private benefit. If the common stock thus to be acquired were capable of supplying an unlimited number of persons, then they might be deemed in the constitutional sense the public; but, as already stated, the stock would be quite inadequate for such a demand. The fact that a small supply is tendered free to the first takers does not show that the public can enjoy it.

But not only does the constitution require that the property taken should be for the public; it is also necessary that it should be for use. The chief purpose in the enjoyment of the property must be utility; but it cannot be doubted that the main object of the present statute is to furnish a means of amusement or sport to the few persons who have the inclination and leisure for such pastime. The public utility to be subserved by such indulgence is imperceptible. "The reason of the case," therefore, does not seem to warrant the conclusion that the proposed taking is "for public use."

When we look to "the settled practice of free governments" we find no parallel for the present enterprise. There are many instances of the exercise of eminent domain for the purpose of furnishing facilities to be enjoyed by individuals. Such are parks, highways, ferries, railways, telegraph, and telephone lines, etc.; but these differ from the right now under consideration in important respects. First, they are essentially useful; secondly, they are used by great numbers of people; and thirdly, their use by the individual abstracts nothing appreciable from the common opportunity of use.

There are also some instances of the exercise of the power in order to afford facilities for private enjoyment where it is intended that each individual shall abstract a portion from the common stock. An example appears in the condemnation of water for domestic purposes in populous neighborhoods; but here also marked differences from the present scheme are observable. The end sought is utility of the greatest urgency, and the natural supply is so abundant that private abstraction cannot exhaust it. In all such instances these characteristics will be found in substantial measure to make them of use to the public. We have found no instance of the exercise of the power in order to afford a means of pastime capable of being enjoyed by only a few persons.

There is another consideration deserving of some weight. The constitution requires that on taking private property for public use, just compensations should be made to the owner, and this implies that the property taken shall be reasonably capable of just estimation. The lake itself could, no doubt, be fairly appraised, as could, probably, the right of any individual or of any specified number of individuals to fish therein; but I know of no criterion by which the right of an unlimited number of persons to spend their time upon the lake for the purpose of catching fish could be valued. It might be that the appraisers would evade the difficulty by awarding to the owner the full value of the lake; but in that case justice would require that the lake itself, and not a mere incidental right in it, should become public property.

We think, therefore, that neither in the reason of the case nor in the settled practice of free governments is there legal support for the proposed condemnation.

The power of eminent domain is one of the extreme powers of government. When employed for the purpose of enabling it to perform its functions its scope is limited only by the wisdom of the Legislature. But when it is exerted with the view of furnishing facilities to private individuals, it so easily runs into the taking of one man's property to give it to others, in disregard of that right which the constitution declares to be inalienable, the right of protecting property, that it behooves the courts, where private owners can be fully heard in their own behalf, to take care that constitutional rights are guarded and constitutional limitations observed.

On full consideration we are constrained to adjudge that the present proceedings are designed to take the plaintiff's property for other than the public use, and are therefore illegal.

The judgment of the Supreme Court should be reversed, and a judgment entered setting aside the proceedings taken under the statute.

## Jonah and the Poor Whale.

A YOUTH had preached in the College Chapel [of Glasgow]. After service the professors in the beautiful "Fore Hall" were discussing the sermon. "They were all very complimentary. But Prof. Buchanan (the great Professor of Logic, whom, strange to say, Archbishop Tait did not think very clever), broke in: "Oh, don't say that. There was a sad want in our young friend's sermon. He said a great deal about how Jonah felt. I should have liked to hear something about how the whale felt!"—"Twenty-five Years of St. Andrew's."

## The Log of the Iris.

BY J. N. STALKER, DETROIT, MICH.

THE prospective L.L.D. and myself, in council assembled, had decided to go on a canoeing trip for our summer vacation. This was in the winter that the council met, so we had plenty of time for our preparations. We first ordered a canoe built, in conformity with some ideas that we had on the subject, and which as we now consider them excellent, may be of interest.

The craft was 15ft. long, 30 in. beam, and 11in. deep amidships; decked over 3½ft. forward and 3ft. aft, and equipped with a leg o'mutton sail on a short mast and long jointed boom for sailing. She was, of course, heavier than a perfectly open boat would have been, but the lockers underneath the decks were very convenient for storing our stuff, and the decks themselves were absolutely invaluable in some of the heavy weather we later encountered. With regard to equipment, we were necessarily hampered by our lack of ability to carry very much, and when that is the case, of course, what to take and what to leave is largely a matter for individual preference. We took a pup-tent, rubber and woolen blankets, hatchet, frying-pan, bacon, corn meal and hard-tack, besides the endless array of small things stowed largely in the pockets, of which any camper can supply a list containing three times as many as it is possible to carry.

Equipped as indicated, we found ourselves one Saturday afternoon in the town of Ypsilanti, and got our boat, which had come out by rail, into the water about 5 o'clock. Then, we started, and the feeling of delight with which we pushed off into the swift and beautiful Huron River would be hard to describe. For two weeks we would be our own masters; sleeping, eating, and traveling, where and when we chose. And then how we expanded! Colleges and banks faded away into dim and misty unrealities, and we experienced the rare and pleasant sensation of feeling, now that we were entirely dependent upon ourselves, like complete men.

The Huron River charmed us from the very first. A more beautiful little stream it would be hard to imagine, with its rushing current, eddying and swirling along under overhanging trees, which lean over at all angles from either shore, and very frequently, indeed, are fallen quite across the river. These trees were a constant source of interest, and occasionally annoyance, all the way down. There was almost always some way to pass them, either shooting around the end, worming our way through the branches, dodging through the roots, ducking under the trunk, when one end was lifted out of the water, or often skimming over it, which was generally more or less dubious, as we could not tell how much water was passing over until too late to go back. The snags and sunken logs of which the river is pretty full, really increased the pleasure of navigation by adding complexity to the ever changing succession of problems that confronted us. We would think we had our course past a couple of fallen trees

lo and behold! we saw serenely coming down the other side a very tough-looking cap, not quite water-logged enough to sink. It was fished out, and then a few minutes later dropped into the mud and stepped on at a portage, made necessary by a fallen tree. That was pretty good for the first hour, but as will be seen, was only a starter.

About 6:30 we came to an ideal camping ground on a little island, and concluded to stop there for the night. In a short time we had our tent pitched, a camp-fire crackling cheerily, with bacon sizzling in the pan, our canoe hauled out, turned over, with most of our stuff stowed securely underneath, and everything ready for supper. The supper was of long duration if not very various, being a continuous process of cooking pans full of bacon and then eating them, along with bread

where with the expectation of returning, every difficulty surmounted, such as a dam, acts as a drag on the spirits, owing to the knowledge that it must be remet. With us it was quite the contrary.

Another continual source of pleasure was the animals along the banks. They seldom seemed to notice us at first, coming along quietly as we did (though unlike the traditional Indian, there was always the regular gurgle and drip of the paddles to betray us). There are almost no boats on that part of the river, and I suppose the animals, while keeping a pretty good lookout to landward, though that from the water-side they were safe. That day we saw dozens of squirrels and chipmunks perched saucily on stumps, or rollicking through the treetops with their dare-devil leaps and scrambles; a score of muskrats, which frequently let us approach within twenty feet of them when swimming before they dived, half a dozen woodchucks, a mink, and hundreds of turtles, besides dozens of animals who did not wait for inventory, and of which we saw nothing but the splash.

One of these turtles provoked a shout of laughter from us by the eccentric means of self-preservation he adopted. We were noticing him because of his unusual size and shape; he was probably twelve or fourteen inches long by eight or nine inches wide, and positively, he looked less than an inch thick, as if he had been stepped on accidentally by an elephant, or been put through a clothes wringer. Later, when we saw more of this species, we perceived that it was the fashionable shape on the river, and admired it as sincerely as if it had been a straight front corset. As I started to say, this peculiar beast paid no attention to us until we had got safely past him, when he raised his head straight up on his long neck with the appearance of wildest alarm, and started galloping desperately after us down the slope. He descended in a little avalanche of sand and pebbles, with a more ludicrously clumsy method of propulsion than we believed existed, his head and tail waving frantically in the air all the time. In comparison with him a galloping cow was like a naked nymph for grace.

The number and variety of the birds we encountered continuously shamed us for our ignorance of natural history. A good many of them we knew by sight, but their notes we found to our disgust that more often than not we were unable to identify. In the mornings, especially, about sunrise, we would be surrounded by a regular carnival of melody, each saucy little rascal apparently trying to outdo all his neighbors in the volume of his music he produced. In the midst of such exuberant happiness, with a glorious sunrise ushering in a fresh, clear day, I defy the gloomiest misanthrope in the world to be anything but cheerful, and we are not misanthropes by any means.

Kingfishers were very numerous along the river, though what fish they found I do not know, and watch-

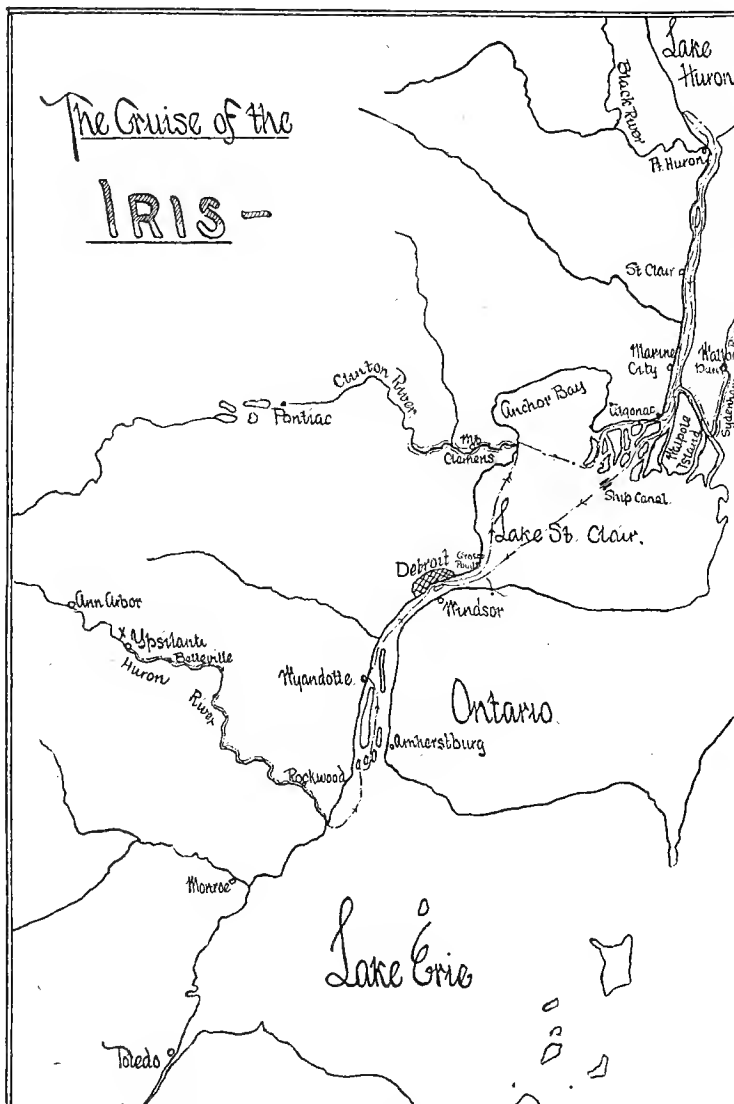

Chart of Course taken by the Canoe Iris.

and milk (the latter ignominiously purchased from a farmer).

I had wondered a trifle how we would put in our evenings, but we passed most of that evening very pleasantly in the manner indicated above. It may be confessed, however, that our enthusiasm for bacon somewhat abated before we got back home.

When we had finally finished and had washed the dishes (not much of a job, fortunately), we piled the wood on the fire, got our cigars, and resigned ourselves to absolute contentment, I swinging my cap to and fro in the smoke to dry it, the LLD. joyously digesting his bacon. In the course of these maneuvers I dropped the cap into the fire, burning it in spots and covering it with white ashes, which, when I tried to brush them off, united with the green mud in entering into the wet cloth. The occurrence made an ineffaceable impression on the cap, it was never the same again. Finally, stimulated by the example of the frogs, crickets, tree-toads, etc., of the vicinity, we lifted up our voices in song and really enjoyed it very much. We seldom have a chance to sing with vigor like we did then, as nothing of the sort would be tolerated by neighbors. At length we squirmed into the tent between the blankets, wrapped our heads up in our coats and didn't go to sleep. The situation was too strange the first night, and the chorus outside too energetic.

The night was an unusually cold one, and about 4 o'clock we decided that we had enough of that miserable cold, achy feeling, so we got up, built a fire, and were soon happy again.

For breakfast we had hot buttered toast (really very creditable toast), bacon, rye bread, cheese, milk, and the best of sauces. Before 6 o'clock we were on our way again to make as long as possible one of the most enjoyable days we ever spent. A most delightful feature about traveling the way we did, was the fact that we never knew what was coming next, and whatever it turned out to be, we had never seen it before and never would again; when a person is going any-

Canoe Iris on Lake Huron.

beautifully clear, and would swoop down on a narrow opening with a rush, only to find a tree stump or something just in the middle of it, a couple of inches below the surface. We had to act quickly at such times to avoid difficulties.

It was at one of these trees, not twenty minutes from the starting point, that my cap was launched on its sea of misfortunes. In passing through the branches of a tree, being then inexperienced, I allowed the cap to be scraped from my head into the water. We were then close upon another tree which demanded instant attention, so that before we had any time to look for it, it had disappeared. While still peering anxiously around, we were swept past a little island, and there,

Huron River.

ing them dive for food, which they did in utter disregard of our presence, is something of which I would never tire. Of all the creatures we encountered, however, the species for which we came to have the greatest respect was the crow. By paying strict attention, we became grounded in the rudiments of his very considerable language, not to be able to talk it, but enough to be able to catch the drift of meaning of many of the conversations we heard. While the crow is not precisely a lovable bird, he can, nevertheless, command respect through simple force of intelligence.

We paid the more attention to the little creatures I have referred to, owing to the fact that the river banks were delightfully free from human beings. The farmer

of whom we bought some milk for our light lunch, and one or two of the inhabitants of Belleville, were the only members of our own species that we so much as caught a glimpse of all day long.

At the latter place there were two dams, at the first of which we saw the appropriateness of the name. We were obliged to force our way up a steep bank covered with high weeds and underbrush, sweating and groaning most fearfully under the burden of our canoe and equipment; then for rods along the shore through the same kind of stuff until we came to a spot where we could take to the water again. The place was full of nettles, thistles and sharp sticks, and as we happened to be doing business barefoot to dry our shoes, we were brought to the verge of strong language more than once.

Some miles past Belleville we camped for the night, making everything snug and getting our supper ready with an ease and rapidity that astonished us. We then sat down by our camp-fire, and smoked, and watched the stars and the fire, and were perfectly happy. Our evenings in camps we shall never forget. We had been inconsiderate enough to locate near the foot of a big tree which happened to be the private property of a squirrel. Naturally enough he was up in its branches when we planted ourselves at the foot, and his annoyance can be only faintly imagined. Indisposed to come down and discuss the matter quietly, he stormed and chattered away until he must have been on the verge of apoplexy, and without the satisfaction of even knowing that we paid any attention to him. We sympathized with him, but stayed.

The next morning we had had breakfast, had broken camp, and were on our way before 5 o'clock, for our last day on the river. We went down steadily, hour after hour, through the entrancing scenery of the little stream, with the silence broken only by the regular drip of the paddles and the noises of the various birds and animals along the banks, each intent exclusively upon his own affairs. There can be few better ways of seeing nature doing business in her own way than this one.

At length we passed Rockwood, persuading our canoe with some difficulty to consent to be carried around the dam instead of going over it, as she seemed to prefer, and before long had passed out of the almost continuous belt of trees which had lined the banks all the way down. After that we came to the open meadows and marshland, which indicated that we were nearing Lake Erie. If I have not made any references to the unbelievable sinuousness of the Huron, it is because I have felt myself unequal to the task. Bill Nye tells somewhere how he was on one occasion gored by a bull with the result that his insides all came out-

doors, and no matter how the doctors packed them in again, they always had a yard or so left over that there was no room for. I think any finite creature trying to pack the whole length of the Huron River into the number of miles it makes in a straight line, would have much the same experience. It frequently happened that twenty minutes or more of paddling would bring us to within a few hundred feet of where we had been before, and while the distance from Ypsilanti to Lake Erie is only about twenty-five miles in a straight line, it is probably not far from 125 miles by water.

We had by this time pretty well outlined our itinerary, which was, in a word, to run up the lake system into Lake Huron, taking side trips up any rivers that might strike our fancy as we went along. With this attractive prospect before us, and finding no interest in the flat marshes along the river, we were in a hurry to reach the lake. The river was not, however, and with the current dwindled to almost nothing, kept us paddling back and forth in those villainously hot rushes, for miles. The LLD, with a foolish and ill-considered optimism, kept making matters worse by positively announcing the lake at the next turn, for the last five miles, and every tree visible here and there in the rushes was, according to him, manifestly upon its shore. On the strength of each of these announcements, we would hit up our gait in order to "finish in style," and the business got very wearing. At last, about 1:30, we got there in a very much wilted condition, and our first glimpse of the cool, blue waters of Lake Erie made us feel that we could understand better than ever before the delight that must have inspired the war-worn followers of Xenophon when they raised their shout of "The Sea!"

There is a peculiar fascination about a great body of water, moreover, that a little river, no matter how pretty, does not possess. Somehow it would seem presumptuous to think of getting tired of it. We promptly hoisted our sail, and made for Tawas Island, which is situated just below the mouth of the Detroit River, reclining restfully in the bottom of the boat, and reviving rapidly under the influence of the cool lake breeze. After a brief and very enjoyable sail, we stopped for lunch, for which there was no lack of appetite, as we had had nothing to eat since before 5 o'clock. Before we did anything else, however, as our clothes were still wringing wet from our paddling on the Huron, we went in for a swim and gave them a little soak; then while they were drying, proceeded in the most startling negligence to eat our lunch. This was a mistake, because the call to dinner, meant for ourselves, was apparently considered general by hordes of shameless mosquitoes, who promptly swooped down

upon us, utterly oblivious of the fact that we were not dressed to receive them. We finally came to the conclusion that it did not pay to take in the raw material and dispense equally large quantities of the refined product, so packed up, put on our wet clothes and went on.

We paddled over between Hickory Island, with its magnificent trees and picturesque summer cottages on one side, and Sugar Island with its crowd of merry picnickers on the other. At these latter, we cast a few longing glances, but, alas! our costumes and general appearance did not warrant any intrusion. There was no good place to camp in the vicinity, and we determined to make Stony Island, barely visible in the hazy distance. A stiff paddle against the current finally brought us there, but then we could find no place to pitch our tent that was in any way inhabitable. The shore, instead of being a real shore, is a hybrid mixture of stones, water, reeds and mud, and the mosquitoes reminded us of those prehistoric monsters whose skeletons we see in the museums. By the time we had quit fooling around the place it was already dark, and as we had been paddling almost without a stop since 5 o'clock in the morning, and had covered between fifty and sixty miles already, we felt little enthusiasm for more work. Wyandotte was the only place to make for and that would necessitate another hour or so of hard plugging against the current, but there was no help for it, so we went ahead.

To make a long story short, we eventually got there, but we were pretty near "all in." We went to the Michigan Alkali Club boat house, after we had found it, with the request that we might leave our boat over night, and were most courteously received. In getting the boat out of the water, however, I passed through an experience which I cannot recall to this day without emotion. I was standing down on a single wet plank about on the level with the water, and being rendered careless of all else by emptiness and fatigue, behold my feet slipped off the plank and I fell into the dark, cold stream. I had always wondered if I could swim with all my clothes on; I found out (a) that I can, but (b) that I hate to. The LLD promptly abandoned the canoe to the tender mercies of the night in order to wait until I returned to the dock and then grab me in such a way that I could not possibly climb up. When I did crawl out, the canoe had vanished, and considering everything, I was seriously annoyed. With the help of a borrowed canoe we found ours and got it back, a mixed crowd of young people illuminating the scene with fireworks from an upper balcony, and apparently enjoying it.

[TO BE CONTINUED.]

## The Indra Log.

The Story of a Cruise from Marblehead, Mass., to Sydaey, N. B.

BY HENRY G. PICKERING, BOSTON, MASS.

(Continued from page 217.)

Wednesday, the 15th, we are still at anchor; the day's proceeding varied by a foraging trip ashore; eggs and wild strawberries to eke out the larder. In the evening the men go ashore to church, a good habit to be encouraged whenever possible. The night is not quite so good for sleeping, the yacht pitching and rolling more, especially at change of tide.

With the morning comes a welcome breeze from the southwest, strong and favoring; we change our clocks to Dominion time, and at 11:15 leave the can buoy off the southeast point of the island, shaping our course for the Grand Passage, Bryer Island. The tide is against us, and very strong, but the breeze holds and strengthens and we make anchorage off Westport, Bryer Island, at 4:20. The half point allowance for the tide in the twenty-six mile run has proved too small, as our going shows. At 5:10 in the morning, we face the great tide-rip in the Passage, distinct in our memories from last year's cruise. The tide here runs from five to six knots an hour, the mere pressure against a spindle, set about midway of the Passage, being enough to throw the water eighteen inches in the air. We pass it successfully, of course, with loss of headway, but the yacht behaves admirably in the heavy cross sea, and in twenty minutes or thereabouts we are well through it. A long day's sail is before us with long and short tacks, and varying winds, very light at the end of the day, and we pick up the whistling buoy off Yarmouth Harbor, work up the rather tortuous passage, and drop anchor at 6:30 in approximately our berth of last year. The fog sets in before bed-time and continues through the night. Why is it that the very wind you want comes when you cannot leave port? It is so to-day; the larder must be restocked and sundry and various matters call us ashore, and it is 5 in the afternoon before we start in tow of a tug for the lower anchorage. Now mark what happens! The tow line, not being properly made fast, slips its bearings and carries away the hood of the

forward hatch. Back we go to our anchorage, and send ashore for a carpenter, who fails, however, to respond, and we must wait over to-morrow for repairs. A quite unnecessary accident and most annoying delay!

Sunday, the 19th, southeast wind and rain; quite as well that we did not make the lower anchorage as proposed, and lie in the teeth of it! Our mate, or sailing master, by courtesy so-called—the owner handles and sails his own boat—leaves us on the issue of responsibility for the accident of the day before, and we must replace him with a new hand forward before starting.

The next day is a gala one for our small company. The Captain's birthday, and it is duly celebrated at dinner with toasts and much good fellowship, and the presentation of such modest gifts as local markets afford. A jug for the "wee bit drappie" and sundry accompaniments thereto.

"Who wakes us at the break of morn,  
And balmy slumber laughs to scorn,  
Till sleep is fled from eyes forlorn?  
The Captain.

"Who steers the Indra hard to lee,  
As staunch a ship as sails the sea,  
From keelson up to maincross-tree?  
The Captain.

And much more to the same effect, somewhat to the confusion of our host, but happily responded to and with mutual fun-making and enjoyment all round. How the great, broad sea, and a common experience of its delights and dangers opens the sympathies and draws closer the bonds of a wholesome and hearty companionship! Commend me to it always for the makings of unselfishness, good humor, and kindly offices one to another. All this we offset against the weather, now "more unkind than man's ingratitude." Then, too, we have visits from friends of the yacht club, and our mail from Halifax, forwarded as by telegram of the day before—so we are not comfortless. The new mate, Mr. S., arrives on board, engaged through the kind efforts of Commodore L., of the yacht squadron; but his stay is doubtful, as he awaits possible orders for a South American cruise. Two days of more or less weather, as you choose to look at it, and a further chance for Mark Tapley and Job! East wind and rain. Mr. S. gets his anticipated billet as master of a ship, bound

for Buenos Ayres, and leaves the yacht. In his stead we ship G., a Yarmouth fisherman, well recommended and with good knowledge of the coast, and Sunday, the 26th, started eastward at 9 A. M.; but after making three or four miles toward Chebogue, the fog sets in thick, the wind falls, and we return to anchor at the bar by the Inner light. Three fishermen are anchored near by, waiting, like us, for a chance to clear. The barometer is falling, and next day it is a northwesterly gale. We are glad to be in harbor and stay there.

Tuesday, July 28, a fine morning with strong breeze from the northwest, and we get under way at 8:40 after our ten days' imprisonment, with two reefs in the mainsail, topsail and jib set, all drawing well, and make Schooner Passage at 10 o'clock and Barrington Passage about 1. This route inside of Cape Sable Island saves a considerable distance and eliminates the uncertainties of the Cape. Once through this we shake out our reefs, set topsail and staysail, have a good run past Baccaro, the Salvages and Cape Negro to Cape Roseway, and make the entrance to Shelburne Harbor at 4:30 P. M., anchoring about a mile south of Adamant Shoal, under the west shore. We have had a fine day's run of seventy miles, in ten hours; and the yacht has shown herself a good sea boat, taking in almost no water even in the roughest tide-rips. Of tides the Atlantic Coast sailor has no conception until he has tried the west and south coasts of Nova Scotia. The ebb flows westward through the narrow passages with extraordinary force and speed, forming difficult cross-seas, and necessitating liberal allowance in the compass for a run of any considerable length. Even on the open coast, without a fair wind, you are actually running astern against a two-knot tide such as you will find all the way from Digby to Yarmouth.

More fine weather now, and we think we deserve it. A beautiful morning July 29, clear with favoring, though light wind from the southwest. We leave our anchorage at 7:50, without having entered the inner harbor, one of the finest on the Atlantic Coast, for we are far behind our schedule and must be moving eastward. The coast here is low, but of decided beauty and interest, with rolling meadow, upland and long stretches of hard, white sand beach. Liverpool, at 3 P. M., and our first appointed stopping place for fishing. Here is the Port Medway River, where we are beneficiaries of rights owned by our friend, Dr. W., of Boston. We

arranged to start early next morning for Greenfield, eighteen miles away and inland. Breakfast aboard at 5:20, then ashore and take team, arriving at Greenfield in time for second breakfast at the small, but comfortable hotel. The river is a picturesque one, with a number of good pools, but we are, of course, late for the salmon, and the trout are small and not of very full flavor. Back to the hotel for a late dinner and the night; the next morning we fished the lower river from where we had stopped the evening before. Two grilse and a couple of dozen small trout reward us, and we end a pleasant two day's outing, and are back on board for a late supper at 9 o'clock.

How glorious these clear, crisp mornings are, and how the blood courses in the veins! These are the halcyon days of yachting life—past misadventures forgotten, no more grumbling at fog or fate, but "Stand by the main sheet!—a little more—that's well—make fast!" See how she takes it, and carries her lee rail awash!

We make St. Margaret's Bay in good time after eight hours of perfect sailing, and then a long beat up to the anchorage in Hubbard Cove. We are a strange sight in these waters, no yacht of our size having ever visited

Bras D'Or Light.

here within the recollection of the veteran light-keeper who comes aboard for a friendly chat. On this coast look out for fishing nets; they are set all along shore at frequent intervals, and are easily picked up and cut by a boat of our draft, and constitute almost the only sea peril to the owners, and incidentally to the yachtsman's pocket, that we have here encountered.

A fair wind in the morning and a good run inside Sambro Light, gaining a considerable distance, round Chebucto Head and to anchor in Halifax Harbor in front of the Royal Nova Scotia Yacht Squadron's house at 4:35. We are promptly visited, as is the invariable custom in Canadian ports, by a delegation from the club extending to us the hospitalities of the Squadron's house during our stay.

Next morning going ashore we are met by the house secretary with our mail, and return with him to visit the club's ample and comfortable quarters. In the late afternoon we are the guests of the honorary secretary, Mr. Wyld, on the Youla, the commodore and Mr. T. on board, to the Northwest Arm, an exceedingly pretty and sheltered bit of water with beautiful country places and smaller cottages along its shores, their grounds freely thrown open to picnicking parties from the town in full enjoyment of the afternoon's outing. We dine and pass a delightful evening watching the fireworks and boat parade of colored lanterns, and listening to the admirable regimental band; all of this a weekly occurrence with the Haligonians, and to be heartily commended to the holiday-seekers of our home shores.

Next day it is our turn to entertain our kind hosts at

St. Peter's Passage.

lunch and dinner, and to take regretful leave for the morrow's start.

The smoky morning of the 5th opens with a slack wind falling to calm, but once under way the breeze strengthens, the skies clear to the eastward, and we do some fast sailing on our all-day run. Jeddore Harbor lights are in line at 9 P. M., and we anchor in the narrow entrance. Have a care here, and work slowly and cautiously up—there is little room to spare.

August 6, and our second trout fishing trip. Ten miles inland to drive and a mile and a half row up river. The fish are small, but we get a mess with specimens of sea trout and grayling. But there is lake fishing further away and worth the trying, we are told; so why not stay over the night? The country is fine, the weather promising, and the sport? Well, we shall see what the morrow brings forth. So we start for the great "Ship Harbor Lake" at 7:30, with the D's, father and son, a haul and a carry by the way, changing boats at the latter, and then seven miles straight away to the head of the lake. The shores are densely wooded, and the whole character of the country strikingly like that of a Scottish Loch; even the touch of mist is not wanting this morning to complete the likeness. A one-pound trout got trolling and a two-pounder with the fly at a reedy point along shore are our

best fish. We lunch at an old logging camp, and vary our return journey by two of us taking boat for the entire distance to the yacht, and finding thereby that we could have readily brought the latter to a point within easy reach of the Lake.

We are waked in the gray of the morning by an inbound schooner drifting against us with the tide, and slightly breaking the larger boat swinging from the davits, a fortunate escape from serious damage. At 9:50 we are off with a good wind and shape our course from Jeddore Rock for Beaver Harbor; the sea is heavy from the hard blow of the day before, but the wind holds well and we anchor off Port Dufferin, Beaver Harbor, at 4:30. Here is report of further trout fishing at Quoddy, and L. and E. must needs be off that evening in preparation for it. The writer, not so intent, follows in the morning, a three-mile walk to Warren's farmhouse, and there awaits their return. It is late supper time when they arrive, but it has been a good day's sport at the lakes, and the trout gamy and of fair size.

Fog and rain in the morning, clearing later with a light breeze in the afternoon. We make sail at 5:10, intending a night run, but find a heavy sea outside and falling wind, so we run back to harbor and anchor behind McLeod's Island. A snug berth and a beautiful moonlight night, and we are consoled.

It is nearly noon of the next day before the breeze comes, and we start, intending to make Liscomb Harbor for the night, but the wind falls again, the fog comes in rapidly and thick, and we make ready for our only night run of the trip, as it proves, to Canso; "oilers" are got out, the binnacle lamp lighted, and watches assigned. First watch, eight to twelve, seventeen miles; slow progress, but better than the next—twelve to four—when we make but six miles by the patent log astern. Now the breeze freshens, and we do some good sailing; so good that we decide not to go into Canso Harbor, but to keep right on for St. Peter's Passage, the entrance to the Bras D'Or Lakes. We make the moorings there at 11:45 A. M., finding the Sibyl, N. Y. Y. C., which has made the trip from New London direct, and go at once into the lock of the canal. The passage is a short one, but slow,

Frenchman at Sydney.

by tow-line from the shore and with a considerable traffic to and fro, and we tie up at the further end for lunch: then a mile or so up the Little Bras D'Or, but the wind is ahead, and beating up the narrow passage a difficult problem, so why not anchor for the night in this pretty bay, out of the channel and opposite the miniature light-house on the point?

August 13, a perfect day, with a fine and favoring wind through the narrow channel into broader water. Here we have our first glimpse of the beauties of the Bras D'Or, in places not unlike the Norwegian fjords, but with much variety of shore, dotted with lighthouses on projecting spits and sandbars, and inland with well kept farms and settlements, signs of an industrious and prosperous country life. At the Narrows we pass the draw of the railroad bridge and are hailed from the Baddeck steamer lying at the wharf. Here is our friend and new shipmate, A., whom we had telegraphed to meet us at Baddeck, and we lay to and take him aboard with hearty welcome. Then up the lake again, the Greater Bras D'Or, and at six o'clock come to anchor off Baddeck. It is a short stay here, for Whycocomagh (pronounced locally "Haugama") and the Margaree River of salmon fame are awaiting us, and "Baddeck and that sort of thing" can abide our return. So at 1:30 next day we are off via St. Patrick's Channel, and anchor in the late afternoon opposite Salt Mountain in the harbor of Whycocomagh. From here the Margaree is some thirty miles away, a day's drive, with lunch at McLean's, the ten-mile stopping place, where we find sundry anglers, yearly visitors to Ainslee Lake, the famous trout fishing ground of this region, but who are having this season but indifferent luck. A beautiful valley this of the Margaree, the river promising with tempting pools and clean shore and shingle from which to cast. Our host is Dougald Campbell, a genial Scot, and keeper of an excellent hotel. We are unannounced, other guests are coming, and rooms are limited, but we are made welcome and comfortable at once. The population here is almost entirely Scottish Highlanders, sturdy and independent, and with much canny humor and kindly feeling.

Next evening, Sunday, come John Carroll and his son, old fishermen on this river, to discuss probabilities and arrange for Monday's outing. Under the law all nets must be taken up on the evening of the 15th of October, the day of our arrival, and legalized netting then ceases.

\*The title of Charles Dudley Warner's book on this region.

fly-fishing continuing to the 31st. This, under ordinary conditions and earlier in the season, should insure an abundant fresh run of salmon into the river from the sea; but we are very late, and the season has been an "off" one, so we temper expectation with hope, and are at least sure of the delights of nature in this most beautiful of valleys.

Monday morning we are told the fish have come in already and have been seen in numbers in the pools; but if they are there they are certainly very shy. At last A. raises a grilse, but it fails to take the fly. Nevertheless it is a good omen, and possibly forerunner of more; and sure enough, in a long pool just below E. hooks and lands a fine fresh-run salmon of 18 pounds, plump and bright, and with the sea-lice still on its sides—sure sign that it is not long since it left salt water. The Margaree is an aggravating stream, from the fisherman's point of view; at least it was so to us, for the apparent conditions of stream and shore are ideal, and we fished it faithfully and with all the care of which we were capable, but beyond this morning's result we got nothing and saw nothing of the salmon tribe during our stay. Trout there are,

Frenchman at Sydney.

nevertheless, of moderate size at all points on the river, and these supplement Mrs. Campbell's excellent table at morning and night.

Eleven miles away on the Northeast Branch is the hatchery, to which we drive for a try at further pools, and with the fisherman's never-failing hope uppermost in our breasts. The country is of great beauty here, a fine stream with richly wooded banks, and "indications" are not lacking, but the salmon are elsewhere, or will not rise to our fly. The probabilities are that the entire region is over-fished, as the well-trodden paths at all points to the shore would indicate, as well as netted and speared. "*Hinc illa lachryma piscatoris.*"

Next day a thirty-mile drive back to Whycocomagh, and we are soon on board with our spoils, which include two young geese purchased at Campbell's for the larder, and duly appreciated by all hands.

In the morning the elder Carroll, most excellent of fishermen and companions, who had driven us over the day before, pays us an early visit on the yacht, and at nine o'clock we are off for Baddeck. At Indian Bay, St. Patrick's Channel, we drop anchor and go ashore for a short sporting trip, E. to the Baddeck River, where he secures eight snipe and sights two flocks of ducks, and A. and P. to fish the Middle River, most picturesque and promising of trout streams; but there are few fish rising, and one only of a pound and a half takes our fly—just a suggestion of what "might be" for the patient angler.

A short stop at Baddeck next day, and after lunch we are under way once more for Sydney, rounding the fine wooded promontory owned by Professor A. Graham Bell, and through the Narrows. Here are high shores and flawy winds, and, profiting by the maneuvers of ves-

View south from Louisburg Light, showing old town of Louisburg in the distance.

sels ahead, we drop our mainsail and work through under jib and foresail, then rounding the outer buoy under a strong and favoring wind we shape our course direct for Sydney Harbor. At seven o'clock we are at anchor opposite the yacht club house, our "farthest North," and destined to be the end of our outward cruise. There is cordial welcome, as always, on shore, and the usual pleasant interchange of courtesies with the club.

August 22, at eight in the evening, we start by train for Louisburg, and find an excellent small hotel, the landlady and the owner, Captain K., British Navy, retired, and a veteran of the Indian mutiny, most attentive and kind.

The morning we spend at the old town, going over the fortifications and re-reading on the spot the story of the two sieges, the extraordinary strategy of Pepperell, and the daring energy of Wolfe. There are far more indications of the forts than we had expected to find, and the traveler and student may well spend a day here to his enjoyment and profit. The harbor here is excellent, and the entrance channel well buoyed, and, with this wind, there is a fine surf at the lighthouse cliff where we idle away the afternoon.

Next morning at seven we start again for Sydney, and

are on board the Indra at nine o'clock. Now ensues preparation for departure on the writer's part, who must leave the yacht this afternoon with many unavailing regrets for the homeward journey, and for the starting next day of the Newfoundland expedition, E., L., and A., on a fortnight's trip by steamer to Port-aux-Basques, and then rail and canoe to the fishing and hunting grounds. As this does not pertain to the Indra riding quietly at anchor in Sydney Harbor meanwhile in friendly company of big warships and tiny yachts, and as the writer's participation in the trip ends here, this chapter of our story draws to a close.

It is a record of much pleasure and few mishaps, and perhaps even these accentuating the charm of this ever-changing life at sea; at the worst it is "all in the day's work," and at the best is an experience we none of us would forego. The philosophic sailor will dwell not alone on the sunny days of favoring winds and smiling skies, but on the untoward conditions he has met, and against which he has gloriously prevailed—the bit of prompt work here, or the quick judgment there that saved the situation and plucked victory out of seeming defeat. Yes, even defeat after a good fight will lend its not unwelcome color to the retrospect, and the shadows bring out the lights until all turns to a pleasant glow in the unfading picture. Who would give up a day or an hour of it now as we gather for a happy reunion of old shipmates in these autumn days, or each one singly for himself lives over again this life on summer seas?

Yonder lies the good ship stripped for winter quarters, and the sailor's heart goes out to her in grateful remembrance of kindly shelter on unknown paths where his feet have strayed with hers. May all good fortune attend her, and "the little cherub that sits aloft" be her unfailing companion in all the days to come.

## Southern Letter.

THE yachtsmen of the extreme South pride themselves upon the fact that their sport has at last entered upon the boom which will, before long, place this favored section of the country's seaboard in the front rank as an up-to-date and popular yachting coast. The advantages of both sides of peninsular Florida have for many years been known to lovers of the pleasure marine, but it is only of late that the claims of that grand stretch of the Mexican Gulf from Pensacola to Galveston have begun to be realized. These magnificent cruising latitudes are almost incomparable for their attractiveness of the climate, scenery, fish, game and romance. Of course, New Orleans, with the varied attractions of a great maritime metropolis, is the Mecca of those cruising from Florida to the east, or Texas to the west, as it is of the hundreds of voyageurs who leisurely float down the waters of the Mississippi in a hundred different kinds of craft in the course of a few months. Whether your cruiser comes down the Great Father of Waters or comes from the east or the west, to the Crescent City, the great attractiveness of the shores of Louisiana, Mississippi and Alabama have been heard of long before this arm of the gulf has been reached. The most attractive of all the gulf coast is the hundred mile stretch lying between Mobile, Ala., and New Orleans. This shore of old ocean is a continuous line of handsome villas, and here many wealthy Northern people spend the winter, and here many people from all the Southern States come for a summer resort, the winters being very mild and the summers cool; exceedingly cool, owing to the influence of the constant gulf breeze.

About every dozen miles or less along the coast there are small and attractive villages of about two thousand inhabitants each, such as Bay-St. Louis, Pass Christian, Gulfport, Biloxi, Ocean Springs and Pascagoula. The entire stretch of gulf from New Orleans to Mobile Bay is what might be called an "inside route," as there is a string of islands paralleling the shore some ten miles out, forming a natural break-water, the body between them and the shore being known as Mississippi Sound. The railroad skirts the shore of the mainland amid a beautiful semi-tropical growth, while some little distance back, as the land elevates, is seen the edge of the virgin pine forest, which extends for hundreds of miles away toward the north. The salt sea waters play upon these shores most beautifully and most refreshingly, and they abound with much that is most useful and interesting in ocean life. This fine stretch of country is worth more than a passing notice, for many believe that the day is soon to come when it will be recognized as the Riviera of this continent. Such is the dream of those who already live and sail in the locality. If the section had had half the advertising vouchsafed to other parts of the South, it would long since have seen more halcyon days instead of just now entering upon its red-letter period of prosperity as a winter resort. The first million-dollar hotel was constructed last year—à la The Royal Poinciana—and others are to follow. The Great Southern Hotel, at Gulfport, Miss., mid-way on the coast, has been crowded all winter, as has the Mexican Gulf Hotel, at Pass Christian, Miss., and more accommodations of the same kind are required and will be added for next season.

The sport of yachting is well organized and it is the chief attraction of the coast, there being seven yacht clubs in the short distance of one hundred miles, all being banded together for racing and fostering purposes in an organization entitled "Southern Gulf Coast Yachting Association," the combined enrollment of members of which is above the two thousand mark. It is the intention of the association to make this coast one of national importance, and steps are on foot to institute yachting events which will attract the attention of lovers of the sport in all sections of the country. Costly trophies will probably be put up, the promoters of the sport desiring to have events patterned after the Seawanhaka Cup and the Canada's Cup take place here every winter. That the Southerners can handle such affairs was amply proven when the Southern Y. C. in the year 1884 put up the sum of \$1,500 for an inter-state race; that they can be strong opponents was demonstrated, as the Louisiana yacht won from the New York representative in this contest, and that they would be excellent hosts they crave the opportunity to prove. Brethren of the North are earnestly requested to suggest what kind of contest

and style of craft should be selected to be the most popular with those who would like to come South.

With an idea of building up a small racing machine class on the style of those which contest for the Seawanhaka Cup, and which are so popular with the clubs of the Inland Lakes Y. A., the Southern Gulf Coast Y. A. three years ago offered a valuable prize for boats of that size and type. The class has grown so that it is beginning to be the desire to want to try conclusions with the scows of other parts. One Western boat of this class was brought here and raced last season, and there is a Mower and a Crane designed craft in the fleet, to say nothing of a number of other likely ones that have been modeled after fast machines of the North. Splendid additions have been made to this class this season, at least two of the latest bidders for honors being expected from the shores of Oshkosh, where was produced the champion of the United States. Coming on about now, the Southern Association yachtsmen begin to want to get into this national skimming-dish game, for they have taken to the type for their small classes, as it is found that boats of the kind are very good for use for the younger element in a climate which invites no end of "slopping around" during all the months of the year.

Yachts of the more pretentious sizes are now being encouraged also, and the South particularly desires to be well up to the fore with a class of cabin sloops of 30ft. rating, such as are being encouraged by the Y. R. A. of Massachusetts, the Y. R. A. of Long Island Sound, the Y. R. U. of the Great Lakes, and other associations and individual clubs. This is the favorite size of cruiser for use on these tranquil waters, as they afford accommodations for four or five comfortably, and yet they are not too large to be transported on the longest of flat cars. The latter fact is one that is appreciated, as it is being hoped that some of the crack racers of the North will be brought down next winter. Last winter the owner of one of the fastest Boston yachts proposed to bring his boat here for a series of races, but the yachtsmen here had not anticipated such an event, and they were in nowise prepared for a contest, but they have since been up and doing, and there are to be this season thirty-footers for the express purpose of meeting a Northern invasion. Boats are being built here from lines by leading Northern designers, and a Herreshoff and a Hanley sloop are now being negotiated for. Those in a position to know consider that the yachting world will be quite surprised to know the number of fine Northern cabin boats which will find their way South in the next several months. It is only in the past year or so that our yachtsmen began to wake up to a new order of things and want a better class of cruiser-racer, one that comprises in its make-up the modern measure of speed, style, finish, comfort and general handiness.

So much for the yacht that is a yacht, when the matter is written by a "wind-jammer crank," but candor compels the statement also that the boats of the other crowd, the motor yachts, are increasing in numbers at astonishing rapidity. The South, always conservative, took to the gasoline engine rather slowly, and not many of them appeared until the experimental stage had been passed in the motor manufacturing centers, but now the motors seem to be coming this way by the car load. The clubs and the association are welcoming them gladly, and where in former seasons the motor boat races were a side issue at our regattas, this season, what think you? the motor boat races will be held upon special and separate days from the "yacht" races. Auto-boats, automobile launches, launch-omobiles, "me latest launching-car," and what not, are, if not literally in the air, figuratively speaking, to be seen on every waterway path. The launches of last year are considered now to be good enough for fishing and oyster boats, and the sound of the hammer tacking on the veneer to "airy, fairy" forms is now busily heard in the Southland. In speaking of a very lightly constructed hull now being built here, which has the small frames very close together, an old barnacle of a ship carpenter said that they "might as well 'knock-off' planking altogether and just caulk between the frames." Speed, speed, thy name is frailty. Our regatta committees are up-to-date and agile in handling a timing watch, and all this speed that is being figured on by all classes of our yachtsmen will be measured with accuracy; the rules and regulations to be used for the motor races will be those of the American Power Boat Association.

The promoters of the sport here feel that if the South should hold a big contest every winter, both for speed launches and sailing yachts, the plan would meet with great favor from the devotees of boating throughout the entire country. Several of the leading motor manufacturers have been broached on the subject, and it is certain that a number of them will join with a movement to hold a grand mid-winter boat carnival at New Orleans about the month of February.

In summing up, it would seem that there is no fairer field for the expansion of the revolution now going on in all kinds of yachting than the hundreds of miles of the enchanted Mexican Gulf coast with its thousands and thousands of tributary rivers, bayous, lakes and lagoons.

LORILLARD D. SAMPSELL.

## Boston Letter.

BOSTON, March 10.—Last Thursday evening, at the Boston Athletic Association, there was a conference between representatives of the Boston, Eastern and Corinthian Y. C.'s, and of the Y. R. A. of Massachusetts, to arrange dates for racing fixtures for the coming season, with a view to having as little conflict as possible after the racing season has been started. This practice has been adopted for the past three years and has resulted in much good. The fact that clubs have not scheduled any event on the day that another club has arranged for a big open or club race has been productive of much better general attendance at all of the races. The fixtures arranged at that conference were as follows:

May 30, Memorial Day—South Boston, Y. R. A. open, City Point.

June 4, Saturday—Boston, club, City Point.

June 11, Saturday—Corinthian, club, Marblehead.

June 17, Friday—Boston, Y. R. A. open, Hull.

June 25, Saturday—Corinthian, club, Marblehead.

July 2, Saturday—Corinthian, club, Marblehead.

July 4, Monday—Corinthian, invitation, Marblehead, A. M.

July 4, Monday—Eastern, special open, Marblehead, P. M.

July 9, Saturday—Boston, club, Marblehead.

July 16, Saturday—Eastern, special open, Marblehead.

July 23, Saturday—Corinthian, open, Marblehead.

July 28, Thursday—Boston, midsummer series, Y. R. A. open, Hull.

July 29, Friday—Boston, midsummer series, Y. R. A. open, Hull.

July 30, Saturday—Boston, midsummer series, Y. R. A. open, Hull.

Aug. 1, Monday—Eastern, special open, Marblehead.

Aug. 2, Tuesday—Boston, Y. R. A. open, Marblehead.

Aug. 3, Wednesday—Corinthian, midsummer open, Marblehead.

Aug. 4, Thursday—Corinthian, midsummer series, Marblehead.

Aug. 5, Friday—Corinthian, midsummer series, Marblehead.

Aug. 6, Saturday—Corinthian, invitation, Marblehead.

Aug. 8, Monday—Manchester, Y. R. A. open, West Manchester.

Aug. 9, Tuesday—Manchester, Crowhurst Cup, West Manchester.

Aug. 10, Wednesday—Boston, club, Marblehead.

Aug. 11, Thursday—East Gloucester, Y. R. A. open, Gloucester.

Aug. 12, Friday—Annisquam, Y. R. A. open, Annisquam.

Aug. 13, Saturday—Annisquam, Y. R. A. open, Annisquam.

Aug. 17, Wednesday—Corinthian, club, Marblehead.

Aug. 18, Thursday—Eastern, special open, Marblehead.

Aug. 19, Friday—Eastern, special open, Marblehead.

Aug. 20, Saturday—Boston, club, Hull.

Aug. 25, Thursday—Plymouth, Y. R. A. open, Plymouth.

Aug. 26, Friday—Duxbury, Y. R. A. open, Duxbury.

Aug. 27, Saturday—Duxbury, Y. R. A. open, Duxbury.

Aug. 29, Monday—Cape Cod, Y. R. A. open, Provincetown.

Aug. 30, Tuesday—Cape Cod, Y. R. A. open, Provincetown.

Aug. 31, Wednesday—Cape Cod, Y. R. A. open, Provincetown.

Sept. 2, Friday—Wellfleet, Y. R. A. open, Wellfleet.

Sept. 5, Labor Day—Lynn, Y. R. A. open, Nahant.

From July 28 the above list gives continuous racing to the close of the season, with the circuits in sequence, so that the boats will be constantly traveling in the same general direction. Saturday, June 18, has been left open in the above list. This is a good date, with an afternoon tide, and some of the clubs, that have to choose time according to the tide, will probably be most anxious to take it up. There is an opportunity for the Squantum and the Wollaston Y. C.'s to come in on the two first days of the week, when the Boston Y. C. midsummer series is sailed, it being assumed that the Quincy Y. C. will give a race on the day before the opening of the series. This would give all these races in one central circuit and would keep the boats together. It is expected that the Y. R. A. of M. rendezvous will be held on Sept. 10 and 11, and it is likely that some clubs will want Sept. 10 for an open race.

The annual meeting of the Y. R. A. of Massachusetts will be held at the town house of the Boston Y. C., on Thursday evening, March 17. At this meeting the selection of dates for open races is made by the different clubs. The preliminary conference provided for dates for most of the Y. R. A. clubs, especially for those whose fixtures come at about the same time each year. There are other clubs, however, which might want to give open races, and it is likely that they will prefer to hold them on Saturdays, if possible. On this account it may be possible that some of the fixtures in the preliminary schedule may be altered, although it is understood that the schedule arranged at the conference was intended to be permanent. At the annual meeting of the Y. R. A. of Massachusetts there will also be proposed an amendment to the racing rules, which is expected to bring out more or less discussion. The amendment proposed is to adopt a new class, to be called "Class H—yachts conforming to the limitations of the Massachusetts 30ft. Cruising Yacht Association." It is understood that there is more or less objection to the adoption of the class.

The three 18-footers, designed by Mr. E. A. Boardman, which were destroyed by fire at Fenton's shop, Manchester, will be rebuilt at the same yard. Two of these boats were for the one-design class, which is to race the one-design class from Buzzards' Bay. The boats of this class for Mr. Charles Francis Adams, 2d, and Mr. C. H. W. Foster, have been finished at Lawley's. Mr. Boardman has an order for a 50ft. over all auxiliary cruising yawl, for Dr. W. M. Baum, Vice-Commodore of the Chicago Y. C. She will be of the modern fisherman type, with lengthened ends.

Stearns & McKay, of the Marblehead Yacht Yard, are designing a 33ft. hunting launch for Mr. Roger Upton; also a 35ft. launch and a 16ft. speed launch.

Considerable interest is taken in the proposed ocean race for yachts of less than 40ft. over all from New York to Marblehead. Opinions vary as to advantages of such a race and there are some who do not believe in it. There are others who are quite willing to enter their boats. It is considered that the limit of 40ft. is about right, owners of yachts of less than 25ft. waterline, whose over all length does not exceed 40ft., believing that if the modern 30-footers and 35-footers should be allowed to enter, the smaller boats would not have a ghost of a chance in anything like a breeze, notwithstanding time allowance. It is figured that the smaller boats would have to lie to at times when boats of longer waterline could carry their sail and go along. The opinion has been expressed that the same allowance of 30 minutes to the foot is not enough.

JOHN B. KILLEN.

## Royal Nova Scotia Yacht Squadron.

BY F. H. BELL, ROYAL NOVA SCOTIA Y. S.

YACHTING and boat sailing have always been popular in Halifax. The natural facilities for the sport are very great. The harbor is one of the largest and finest in the world. Chebucto Bay, from which the harbor opens, is itself a large indent on the southern shore of the Province, sheltered on the west by high land, and, to a lesser extent, on the east also. The harbor proper begins at Mauger's Beach Light, an old Martello tower situated at the end of a gravel spit extending from McNab's Island on the eastern side of the harbor nearly a mile to the westward, leaving an entrance of little more than a mile between the light and the western cliffs, crowned with modern forts. From the light the harbor extends northwardly for about three miles, with an average width of nearly two. It then commences to narrow until a couple of miles further north it reaches the Narrows, little more than a quarter of a mile in width. Then it suddenly expands again into the beautiful sheet of water known as Bedford Basin, a salt water lake six miles in length by four in width, surrounded with high hills. The harbor curves to the west, and the effect of this, together with the two large islands at the eastern side of the bay and a smaller one further up, is to effectually shut out the sea. One arm of the harbor runs up at the back of the city, a salt water river four miles in length by a quarter of a mile in width, an ideal spot for boating and canoeing. The passages between the islands and the eastern land make another most charming stretch of water. In the whole of this large area of sheltered water, with the exception of a bar at the mouth of the eastern passage, and a couple of insignificant patches, there is a uniform depth of water of upward of one hundred feet. The summer winds, as a rule, are strong, the southwest wind in particular frequently reaching a registered velocity of 25 to 30 miles an hour, and occasionally as high as 40, and the high lands of course make it in places extremely puffy. Under such conditions the only suitable boats are keel craft with moderate sail plans.

Though there was no yacht club, there was a good deal of racing in the earlier part of the last century at the various regattas, much commoner then than now. Old pictures show a good fleet of starters of boats that were fair representatives of the fishing craft of those days. About 1840 Mr. Eben Mosely began shipbuilding in Dartmouth on the eastern side of the harbor. He was a man in many ways in advance of his time, an excellent draughtsman in the days when work on paper was almost unknown and rather despised. He was the parent of a large fleet of brigs, brigantines, schooners, and other small craft—all handsome, speedy, good carriers, and good sea boats. He built a number of fast yachts. One of them, the *Mystery*, of 15 tons, built in 1849, two years before the *America*, was a striking anticipation of the ideas embodied in that famous ship, and also about the same time in the English cutter *Mosquito*. Her lines show a cut away fore foot with the keel raking to a deep heel, a hollow midship section, and a long entrance with the waterlines slightly hollowed. She was a fine all-round performer, and was in her day considered a marvel at a turn to windward in rough water.

The first yacht club in Halifax was the Royal Halifax, founded in 1857. There were many Bermudians among the merchants of Halifax in those days, keen yachtsmen, and the extent to which they influenced yachting is shown by the fact that out of seven yachts on the first register of the club, six were "Mudians." The club prospered, and in 1860, the year of the Prince of Wales' visit, it put up a snug club house at the northern end of the harbor. The Prince presented the club with a very handsome cup, which was raced for for years as a challenge cup. For a number of years the club got along very well, doing a good amount of racing and general festivities. Its fleet was a fair one for the day and the size of the city, and the Corinthian element was always strong. For some reason, however, the club failed to satisfy the demand for sport; possibly because the ideas of its members as to yachts were somewhat too high for the pockets of many would-be yacht owners, and the feeling manifested itself in 1869 in the formation of a separate sailing club, which for a while did a good deal more racing than the larger institution.

Differences between the yachting and the non-yachting sections of the club gradually increased, until in 1875 a number of the yacht owners and more active yachtsmen determined on the formation of a new club, and a meeting was called for the 25th of November. The gentlemen present were Lt. Col. Clerke, A. C. Edwards, J. Tupper, W. B. Fay, H. St. G. Twining, H. H. Black, R. MacDonald, James W. Stairs, and F. C. Sumichrast. It was resolved to form a new club, a committee was appointed to draft a constitution and by-laws, and the club was formally organized at a meeting held on December 7, at which there were present, in addition to most of those present at the November meeting, S. Tupper, F. W. Bullock, W. Webb, J. E. Butler, A. Marvin, and W. S. Salter. The custom prevailed at the outset of having what was practically an honorary commodore, leaving the work of the club to be done by the vice-commodore. The first commodore was Lord Dufferin, then Governor-General of Canada, and the first vice-commodore F. W. Passow. The custom was dropped in 1889, since which time the commodores have been all working officials. And it is worth mentioning here that the club has always chosen its officers and committees solely with a view to their efficiency, and whatever success has been attained has been due solely to management on business principles.

The differences of opinion which led to the formation of the club left one significant trace in the provisions in the constitution that of the managing committee three at least should be yacht owners, and that on all questions of measurement, time allowance, classification, and other matters relating to racing, the vote should be taken by yachts instead of members.

The club was at the outset but a tiny affair. In the first year only 25 members paid subscriptions. It grew, however. It increased to 40 in the second year, and then mounted steadily till it reached a membership of about 80, at which it remained for some time. It received its warrant to fly the blue ensign and to use the prefix

Royal in 1880, and was incorporated in 1888. The largest yachts on the club's register in 1876 were the Petrel of 20 tons, and the Mystery of 14 tons; the rest of the fleet were almost entirely small half-decked craft of from 20ft. to 25ft. waterline, sloop rigged with inside ballast. In its first season the club's programme consisted of four races only with a couple of harbor cruises. The amount of racing done did not materially increase for several years.

The young club received a blow in its first year which nearly caused its death. In the race for the Mayor's cup in September, 1876, one of the yachts, the Cygnet, capsized and sank with the loss of two amateurs, and on the same day another amateur was lost off another competing yacht, the Petrel. Two such disasters in one day gave such apparent confirmation to the popular belief in the danger of yachting that the continued existence of the squadron was in doubt. The upset was, however, mainly due to a very bad boat combined with somewhat careless handling. Since that date the club has fortunately been free from accident, and the modern boats of ample freeboard and outside ballast have often demonstrated their ability to face with perfect safety any weather likely to be encountered in summer time.

From the outset the club determined that in one respect it would leave nothing to complain of, namely, the conduct of the races. Thanks to an enthusiastic and indefatigable secretary, Mr. F. C. Sumichrast, now professor of French in Harvard University, the management of the races was conducted in entire conformity with the rules and suggestions of the British Y. R. A. The "two post" starting line and the "one gun" start have always been the practice of the club, and in every other way the "business" part of the races has been made as smart and up to date as possible.

In the early years of its existence, the racing fleet of the club grew but slowly. Outside influences had little effect in determining the type of craft. Yachting literature, with its host of up-to-date designs, was not then in existence, and Halifax is too remote from the yachting centers of the States for the types prevalent there to have much influence. For many years the principal additions to the club's fleet were the creations of Mr. J. E. Butler, who modeled, built, and raced his own boats. They were all small boats, ranging from 21ft. to 26ft. waterline, with very short overhangs and a beam of about one-third of their waterline length. They had fairly sharp sections and good ends, with plenty of body and very moderate sail areas, and were probably fast for the day, although, in the absence of any outside competitors, that must be a matter of speculation; every boat is proverbially fast when sailing by herself. Their great defect was their extremely low freeboard even for those days. They certainly required more careful handling than a modern keel boat. However, whether it was the handling or the boats, or both, they never met with a mishap, although sailed and raced in all kinds of weather. In Mr. Butler's hands they were most successful as prize winners. The Hebe in particular, a sloop of 25ft. waterline by 8ft. 4in. beam, and about 5ft. draft, was the crack of the squadron for several years. Her lines show a nice, clean boat, with a good entrance and a V-shaped midship section that was a good compromise between the flat bottomed American boats of the day and the deep craft of enormous displacement that the British "1730" rule was then turning out. She was during the several years in which she was owned and sailed by Mr. Butler only beaten once, and that was by a schooner four times her size in a race sailed in half a gale.

In spite of the enthusiasm of a few members, and of the great natural facilities for the sport, the club made but slow progress, in fact for many years was at a standstill. The membership remained below 100, and with a yearly fee of only \$5 the income was insignificant, and interest in the club and the sport seemed gradually dying out. The reasons were not hard to discover. The chief one was the want of a club house. The only accommodation which the club could offer its members and guests was the use of the fine wharf and premises of the Royal Engineers kindly placed at their disposal on race days, which did not at that time exceed half a dozen Saturday afternoons in the season. This, and the occasional privilege of following a race on a tug, and a still more occasional "hodge-podge," was all that the members obtained in return for their subscriptions. A further reason was the difficulty of obtaining new yachts. There was no good building yard in or near the city, no designer, and, in fact, no one with whom a prospective builder could take useful counsel. As the older yachts gradually went out of existence there were no new ones to take their places, and the sport languished. The club held its own, but that was all, and even the enthusiasts began to doubt as to its future.

In 1887 there came a chance to give it a "boom." That was the year of Victoria's Jubilee, and the good old loyal city of Halifax proposed celebrating it with due honor. Water sports of some kind have always been one of the "Alligonians'" favorite forms of celebration, and the yacht club proposed to take advantage of the occasion. A subscription list was opened, and about a thousand dollars was obtained, with which a very handsome cup was purchased for a race in which it was hoped many of the leading yachts, both British and American, would compete. The secretary of the club went on to the States to look up entries, and the race was well advertised. In addition to the city cup, a number of gentlemen in the States interested in Canadian affairs presented another handsome cup to the club to be raced for by Canadian yachts. On the strength of all this a good deal of interest in the club was worked up, and many additional members obtained. In the event the racing was rather a disappointment, as the hoped-for competitors failed to turn up. Lt. Henn's Galatea, the well known challenger for the America's Cup, and Mr. G. H. Warren's English cutter, Stranger, came down from the States, and, as good luck would have it, the old schooner Dauntless dropped in on her way back from her ocean race with the Coronet, and her sporting owner, Mr. Caldwell H. Colt, at once and most cheerfully acceded to the club's request to help make up a race. So far as the cup was concerned, the Galatea, with her big allowance, was tolerably safe, but merely as a race the match was as fine a one as was ever sailed. The course was an open one of thirty miles in the bay and outside. The night before it blew very hard from the southeast, hauling

round in the morning to the west, blowing all day not less than 30 miles an hour, with a big cross sea. These conditions suited the old schooner to a T, and she led the cutter all day, except in one ten-mile turn to windward, when the Galatea, as her owner told the writer, was driven into it harder than ever before in her life. In the result the schooner finished first by quite a bit, which was glory enough for her sporting owner. The race for the cup presented for Canadian yachts was won by the schooner Wenonah. She was owned by a syndicate, and a year later on, when they dissolved partnership, they presented the cup to the club as a perpetual challenge cup, for which purpose it has been held ever since.

The races had been most successful in the object for

Cutter Princess.—Owned by George Wright, R. N. S. Y. S.

which they were chiefly instituted, reviving interest in the club and procuring additional members, but the committee felt that this would be only a temporary revival, and wisely determined to take advantage of the opportunity to obtain a club house.

It was no light matter for the little club to face, with a membership of little more than 100 and a revenue of only about \$500. Fortunately, the club possessed in its commodore, Mr. A. C. Edwards, a man of great energy, enthusiasm, and tact, and he was loyally backed up by an energetic committee. A site was purchased, plans of a modest club house obtained, and the building, together with a good wharf and large boat house, erected. A vigorous canvass considerably increased the membership,

Cutter Youla.—Owned by H. M. Wylde, R. N. S. Y. S.

and the annual subscription was raised to \$10. The club has never had an entrance fee, as it was always felt that it might tend to keep out members of more interest in yachting than means to enjoy it—the class, after all, on which every such club must mainly depend for continued success. The financing of the scheme was a serious proposition. A first mortgage was obtained from a loan company for \$4,500; a further sum of \$2,000 was obtained on six per cent. \$50 bonds floated among the members of the club, and secured by a second mortgage. In addition to these, when the club house and premises were finally completed and opened on the 14th of June, 1890, the club was liable for miscellaneous debts to the amount of about \$1,500.

The property was, however, well worth the expenditure. The late Mr. Hurst, for many years treasurer of the N. Y. Y. C., and a resident for many years in South-

ampton, G. B., once said to the writer that he knew of no yachting station, not even Cowes, comparable to it for all-round excellence. The site is a beautiful one at the southern end of the peninsula on which the city is built, and on the edge of the fine park which includes all the seaward end of the peninsula. It is only a mile from the post-office, and the electric cars run past its gate. The view from the wide verandas is superb, looking right out to sea, and taking in the greater part of the harbor with the finely wooded and heavily fortified islands at its entrance. The water is deep right up to the club wharf, and a considerable indentation of the shore at that point makes a good though somewhat exposed anchorage for the yachts, nearly all of which lie at moorings directly in front of the club house. There is only a six-foot tide, and practically no current. A large floating stage with a self-adjusting ladder makes easy landing at any stage of the tide. The club house itself was of the most modest description. It consisted mainly of a large and airy club room on the second floor, facing directly on the harbor, and surrounded with a roomy veranda. There are no dining facilities, the only provision for the inner man being a room with lockers in which the members can keep what they please, and the club supplies the sundry fluids which are grouped under the general name of "soft drinks." The ground floor opening directly on the wharf, is given up to the storage of gear, and a dressing room with lockers for clothes. For those who can swim, a capital header can be taken off the wharf. A modest lawn with a couple of quoit beds, and a large boat house completed the club property.

The club prospered in its new premises. Its membership rose to above 200, and kept there. A tight hand was kept on expenses, and it soon began to get its head above water. The miscellaneous debt was soon paid off; then the bonds were paid off at the rate of \$300 a year, and finally the loan mortgage was reduced and converted into an ordinary mortgage, and the club gradually found its way into Easy street.

With prosperity, however, inevitably came increased expenses. One of these is, it is believed, somewhat unusual. It has been the policy of the club to lend every possible encouragement to the keeping of yachts. Now, yachts require some attendance, and attendance involves paid help. To the majority of the would-be yacht owners among the club the keeping of a paid hand is out of the question. The club stepped into the gap. It hired men, at first one, then two, and undertook to perform certain strictly stipulated duties for such yacht owners as chose to avail themselves of the opportunity, such as conveyance to and from the yachts, hoisting and stowing sails, drying them after rain, pumping and keeping the yachts in order. For these services a monthly fee varying with the size of the yacht is paid to the club. The members who keep rowboats in the club boat house—some sixty in number—contribute a small yearly fee in return for assistance in getting their boats in and out. In this way, between a half and two-thirds of the wages are recouped to the club. The balance the club bears, and considers the money well spent in the encouragement it gives to the keeping of yachts, especially the smaller kind, many of which would otherwise not be kept at all.

From the outset the club house on race days, which practically means Saturday afternoons and holidays, has been thrown open to ladies, and they have availed themselves of the privilege to the full. The club has always been on excellent terms with the army and navy stationed at Halifax, and the fine band of the regiment or the flag ship frequently performs at the club house on race days, making the premises one of the fashionable summer resorts of the city.

The management of the club, however, never made the mistake of supposing that music and fashion could take the place of sport, and fully realized that if the club was to continue it must be through the maintenance of its own special branch of sport. The difficulty of procuring new yachts already referred to continued. In 1890 Mr. James Fraser brought out from England the Fife cutter Uvira, since so well known in New York waters. But there was nothing of her class in the club to make sport, and her owner parted with her after one season. In the next year another attempt on less ambitious lines was made to induce the building of new boats. A company was formed, and Mr. S. Harlow, an excellent builder, installed as manager. From Mr. Fife was procured the lines of a 26ft. L.W.L. cutter, a miniature Uvira, and two boats were built. They were, and still are, most admirable boats, but their cost was still too great for the average Halifax yachtsman. Another capital boat added to the fleet about the same time was a handsome 27ft. cutter designed by Mr. H. C. MacLeod, since better known as the designer of many fast boats on Lake Minnetonka, and of the Canada cup defender Minota. These three boats made good racing for a couple of seasons, but nothing new was coming forward, except some undesirable additions in the shape of ex-fishing boats, and the committee again felt that a further step in the direction of still cheaper yachts must be taken. A class of one-design 18ft. knockabouts from the board of Mr. MacLeod, the lines of which appeared in FOREST AND STREAM of May 14, 1898, was established. The result was most beneficial. Yachting had at last been brought within reach of the average pocket, the sport flourished greatly, and the number of members actually taking an active part in it was at least trebled. There still remained a class of juveniles to whom even an 18ft. knockabout was an impossibility. To catch these and interest them in the sport, the club in 1902 established a class of 12ft. dingheys, choosing the boat designed by Mr. Morse, of Toronto, the lines of which appeared in FOREST AND STREAM for April 8, 1899. The class has proved an immense success, some twenty boats have been built, and it has been the means of bringing into the club a host of most desirable recruits, some of whom have already expanded into owners of larger craft. Finally, to complete the history of the club's attempt at promoting the building and ownership of yachts within reach of modest pockets, in the past season a second class of knockabouts somewhat smaller, cheaper, and at the same time more modern than the 18-footers, was established. The lines of a boat of 15ft. waterline were obtained from Mr. E. A. Boardman, of Boston (they may be seen in The Rudder for March, 1903), and four boats were built which have given great satisfaction. In the meantime,

the larger boats had been from time to time added to, especially by a handsome and fast 28ft. cutter built by Mr. MacLeod from his own design, and an up-to-date 30ft. cutter built last year by Mr. G. Wright from the lines of Mr. B. B. Crowninshield. The club now possesses a very respectable fleet, especially strong in the smaller classes, and, without exception, the boats are modern keel craft.

In place of the four races in a season with which the club started, there is now at least one race on every Saturday afternoon or holiday from the beginning of June to the end of September, and, including the dinghies, there are frequently three races going on at once. As the courses for the smaller craft are laid off directly in front of the club house, the spectators both in the club premises and the adjoining park have plenty to interest them.

For some years previous to 1902 it had been felt that the club had outgrown its premises, and in the fall of that year it was resolved to enlarge. The work was carried out during the winter and spring of 1903, consisting of a large addition to the club room and the addition of a library, a ladies' room, and greatly increased locker room and general accommodations. The membership of the club is now about 270, its property much exceeds in value the incumbances upon it, its financial condition is thoroughly sound, and with a continuance of the same careful management which has prevailed in the past, it has every reason to look forward to a long and prosperous career.

The yachts of the club have always done a fair amount of cruising, especially on the coast to the westward of Halifax. It is hardly an ideal cruising ground, with strong winds and heavy seas, and, worst of all, a good deal of fog, and with not much in the way of sheltered reaches such as abound on the coast of Maine. Still there are plenty of fine harbors and many charming spots—notably Chester at the head of the superb sheet of water known as Mahone Bay. Shelbourne is another fine harbor about 100 miles west of Halifax. Of recent years both Shelbourne and Chester have started yacht clubs of their own, and provided cups for which Halifax yachts have competed. There is a flourishing club at Yarmouth, with a good fleet of boats of the modern Massachusetts type, and the boats of the club have in recent years met those of the Halifax Club not only at Chester and Shelbourne, but at Halifax. With the increase of membership and the size and capability of the boats, the amount of cruising done is steadily increasing.

One matter more must be mentioned. Reference has already been made to the cup presented by citizens of the United States, and after being won by the schooner Wenonah, presented to the club as a challenge cup. The club has also another attractive challenge cup. It has been mentioned that the Prince of Wales, now King Edward, on the occasion of his visit to Halifax in 1860, presented the Royal Halifax Y. C. with a very fine cup. That club failed to survive the secession of most of its active members, and a couple of years afterwards went out of existence. The cup remained in the possession of the surviving members, and in 1898 was presented by them to the new club as the Prince of Wales challenge cup, they being at the same time made honorary members of the club. The racing for these two cups has been steadily growing in interest. The fixtures for them are made on succeeding days to suit the convenience of visiting yachts, and, with some club races on the same dates, make up a sort of club week. Competitors in recent years have come from Sydney, C. B., from Yarmouth, and from Boston, and it is hoped that each year will see a greater number of outside competitors avail themselves of the opportunity for a cruise in Nova Scotian waters, terminating in a week's racing over courses that cannot be excelled, with the probability of plenty of wind, and the certainty of a hearty welcome.

## The Outside Race.

*Editor Forest and Stream:*

My object in planning the Outside Race is fourfold: first, while there are hundreds of races held every season in which racing craft can engage, there are almost none in which genuine cruising craft can enter and race against cruising craft. It is no use for a genuine cruiser to go into regular events, as such a boat has no chance of success when stacked up against the machine of to-day. Consequently, the cruising man gets no opportunity to try his boat against boats of the same type, except in club runs and scrub matches.

Second, our club cruises are sailed over inshore waters, close to ports, and are generally of such short daily duration that the boats are only out during the hours of daylight. Consequently, little or no knowledge of navigation is necessary. Many of our yachtsmen are afraid to sail out of sight of land, in the first place because they have never done so, and in the second place having no knowledge of navigation they are afraid that they will not be able to navigate from place to place.

Third, it will be acknowledged the majority of small yachts to-day are expensive toys, designed to please the eye rather than to be of service. They have scanty accommodations for their length, are indifferently constructed, and have nothing to recommend them to the seaman except their phenomenal speed. Numerous attempts have been made to suppress this type by inventing measurement rules and inflicting restrictions. All such measures have failed in their principal object. The racing of boats outside for long distance in rough water will necessarily call for a type of boat having large accommodations, strong construction, and genuine seaworthy qualities.

Fourth, the coming of the gasoline engine, and the subsequent craze for craft driven by that motor is rapidly destroying yachting. Unless something is done to attract the attention and engage the interests of men to the practice of the true sport, cruising in sailing yachts is doomed to extinction. The effect of this will be to discount skill and to destroy a breed of yacht sailors who are the backbone and pride of the sport.

Therefore an outside race will give a cruising man a chance to try his cruiser against a cruiser under cruising conditions. It will inspire confidence in himself and his boat, teach him the value of navigation and cause him to study that art and apply it. It will lead to the design-

ing of sound models, to strong construction, and let us hope it will bring back to yachting those who have deserted the true sport.

THOS. FLEMING DAY.

In the above letter Mr. Thomas Fleming Day, editor of our contemporary, *The Rudder*, clearly sets forth his views on the race for 40ft. over all boats from Sandy Hook to Marblehead. Mr. Day is responsible for the idea, and we believe it to be a good one.

Sir Thomas Lipton has agreed to present a suitable prize, in the shape of a handsome cup, to the winner, provided the race is given under the auspices of some club.

Yachtsmen took to the idea of an ocean race readily, and already a number have signified their desire to enter. Even though there are many men who talk enthusiastically about the plan now, when the time came their boats would not be in evidence, there will be plenty of real sailors on hand.

Mr. Day wishes it thoroughly understood that only bona fide cruising boats will be allowed to compete for the cup and that a capable committee will pass upon all boats entered and satisfy themselves that all craft were suitably built and rigged to withstand any weather that might be met on the 320 mile trip.

This of course should be done, for there are a great many danger-loving and foolhardy chaps that would want to start who are not capable of handling their boats outside, principally because they are not familiar with the conditions and difficulties to be encountered and whose boats are not adapted for such a trip.

### Proposed Conditions Governing Outside Race.

1. Boats limited to 40ft. over all; any rig.
2. Crew limited to four; all amateurs. One professional may be carried as steward or cook, but must do no work on deck.
3. Boats to carry stores and water sufficient for ten days; not less than a gallon per day per man of water to be carried.
4. Each yacht must have a first-class tender or dinghy not less than 8ft. long on boats under 30ft. over all, and 10ft. long on boats over 30ft. over all.
5. No restrictions as to the light sails carried or used, but the lower canvas must be that used by the yacht for cruising.
6. All boats must carry anchors, chain or hawsers, lights and complete cruising outfit.
7. Towing by dinghy and rowing allowed.
8. Before starting, captain of yacht must satisfy committee that he has on board proper navigation instruments, charts, etc., and that he has a proper log-book, which must be kept with hourly entries and handed in at completion of race. Extra prize to be offered for best kept log.
9. Committee to reserve the right to reject the entry of any boat that they do not consider a bona fide cruising craft, or that is in their judgment unseaworthy or otherwise unfit to make the race.
10. The measurement for racing shall be the over all length of boat. An allowance of 30 minutes to the foot.

### Gravesend Bay Y. R. A.

At a meeting of the Yacht Racing Association of Gravesend Bay the reorganization of the Association was completed. The Atlantic Y. C. has again joined the organization. Now all the clubs on Gravesend Bay will center their interest in the Association, and this will mean beneficial results to all concerned. It was practically decided that five races would count in the championship series next season for Class N, and under Class N boats will also sail over outside courses. Inside courses were selected for Class P and below. Boats will compete under the point system, as heretofore. Races will be held every Saturday and on holidays. The championship races decided on follow: June 25, Brooklyn Y. C.; July 16, Bensonhurst, Y. C.; July 30, Marine and Field Club; Aug. 27, Atlantic Y. C.; Sept. 17, New York C. C.

The racing rules in force in the Atlantic Y. C. were officially adopted. In the election of permanent officers for the reorganized association, William K. Brown, President, and John R. Brophy, Secretary-Treasurer, were unanimously re-elected to the positions which they held last year.

### Erratum.

*Editor Forest and Stream:*

In my letter on "The Scale of Time Allowances" in *FOREST AND STREAM* of March 5, page 196, the equation at line 21 needs amending so as to read as follows:  
(1.2 × 120m. = 144m.).

SEXTANT.

## YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

### Southern Yachting.

We have added to the yachting department of this paper a letter dealing with the sport in the South. This subject is to be handled by Mr. L. D. Sampson, secretary of the Southern Y. C., and his letters will appear at frequent intervals. Mr. Sampson will cover the racing and cruising along the Gulf Coast, and we hope through this medium not only to encourage the Southern sportsmen, but to gain for them the recognition they deserve from yachtsmen throughout the country.

### One Design Class for Jamaica Bay Y. R. A.

Some time ago a committee was appointed by the Jamaica Bay Y. R. A. for the purpose of securing plans for a one-design class. In this committee's report they recommended that the plans submitted by Mr. E. V. Pardessus, secretary of the Jamaica Bay Y. R. A., be adopted. The boats in this class will be used for general racing and cruising. They will be all 24ft. over all, 18ft. waterline, 8ft. 9in. breadth, and 1ft. 8in. draft. They will carry 460sq. ft. of sail. Several yachtsmen have agreed to build from the design selected, and the new class will mean new life to the sport of Jamaica Bay.

### Gloucester Y. C.

The annual meeting of the Gloucester (N. J.) Y. C. was held on March 6, and the following officers were elected: Com., Benjamin Wilson; Vice-Com., Charles Jeffries; Rear-Com., William Lowry; Recording Secretary, George Van Fossen; Financial Secretary, Frank Smith; Trustees, Harry Quinn, John Fitzmorris, Thos. Plotts, William Shaw, George L. Kurtz; Treasurer, John Casnet; Auditing Committee, Robert Murray, Harry Tolan and Frank Smith.

### 35ft. Launch for C. H. Davis.

Mr. Charles Henry Davis, of New York city, is having a 35ft. launch built by the Electric Launch Company, Bayonne, N. J., from designs made by Mr. Morgan Barney. She is 35ft. over all, 32ft. waterline, 6ft. breadth, and 2ft. 6in. draft. The boat will be fitted with a 25 horse-power Buffalo motor, and with this power it is expected she will develop a speed of 14 miles.

### Westhampton Country Club Schedule.

The yachting squadron of the Westhampton Country Club has announced its schedule for the coming season. On July 16 a club race will be held. The association regatta comes on Aug. 13. An open race will be held on Sept. 3. Regattas for yachtswomen are scheduled for July 28 and September. In 1900 there were 44 starters in the club's regattas; in 1901 there were 49 starters; in 1902 there were 69 starters, and in 1903 there were 77 starters.

### Brooklyn Y. C.

Com. Samuel S. Fontaine, Brooklyn Y. C., has made the following appointments: Fleet Captain, Frederick W. Shipman; Fleet Surgeon, John A. Vorhees, M. D., and Fleet Chaplain, the Rev. James P. Byrnes. The trustees have appointed the following committees: House Committee: John E. De Mund, M. D., chairman; John A. Voorhees, M. D., and Arthur T. Wells. Entertainment Committee: Chauncey H. Humphreys, chairman; John E. Haviland and William W. Butcher. Finance Committee: Cornelius Furgueson, chairman; George E. Reiners and W. Newton Bennington.

### American Power Boat Association.

Twelve delegates attended a special meeting of the American Power Boat Association, held at the Hotel Manhattan, New York city, on the evening of March 10. It was realized some time ago that it was necessary to have special rules to cover the high speed power boats, and the principal business of the meeting was to pass upon some rules suggested.

The new rule defines an automobile boat as one whose rating exceeds ten times the square root of its load waterline length.

These boats are to be fitted with reversing gear of sufficient power to drive them at the rate of four miles an hour. The midship section, which is to be taken to find the rating, is to be the actual greatest transverse midship section, instead of being measured 55 per cent. from the forward end of the water line. These auto boats are to be classified by themselves. All under 50ft. are to be in one class, and above that rating they are divided every 10ft.

This change was made because, in many of the modern speed hulls, the greatest draft and fullest sections are placed well forward. In other ways the Association rules will apply the same to auto boats as to all others. The following classification, according to rating, was adopted for auto boats:

- Class O—All over 100ft. rating.
- Class P—Over 90ft. and not over 100ft. rating.
- Class Q—Over 80ft. and not over 90ft. rating.
- Class R—Over 70ft. and not over 80ft. rating.
- Class S—Over 60ft. and not over 70ft. rating.
- Class T—Over 50ft. and not over 60ft. rating.
- Class V—All rating 50ft. and under.

### Ventnor Y. C.

The Ventnor Y. C., of Atlantic City, N. J., have decided to build a new club house at an expense of \$10,000.

### Staten Island Y. C.

The Staten Island Y. C., which has occupied the old ferry landing at the foot of Canal street, Stapleton, S. I., for a number of years, has arranged to purchase the property in front of the Marine Hospital for a wharf and anchorage, and also one of the large houses overlooking that property on Bay street for a club house.

### Atlantic Y. C.

Com. Harrison B. Moore, of the Atlantic Y. C., has appointed Gen. Benjamin M. Whitlock, fleet captain for the year, and Paul Outerbridge, M. D., fleet surgeon. The board of trustees has appointed as the house committee, Spencer Swain, chairman; S. Edward Vernon and George D. Provost. The house committee has re-appointed Mr. Arthur Clark, superintendent.

Com. Moore has given \$2,000 to be used for prizes during the coming season. The board of governors has appropriated \$1,500 for the regatta committee, and the other officers of the organization have also signified their intention of adding something to the racing fund. These liberal donations will enable the regatta committee to make up an elaborate racing schedule, and to offer some handsome cups. One-half of the money offered by Com. Moore will go toward prizes for an ocean race, and the balance will provide prizes for two power boat events.

### New Bedford Y. C.

Over 200 members attended the annual meeting and dinner of the New Bedford Y. C., held at the Parker House in Boston, a short time ago. The following officers were elected: Commodore, William F. Williams; vice-commodore, Charles R. Allen; rear commodore, Joseph C. Nowell; secretary, Seth J. Besse; treasurer, Horace Woods; directors, Robert A. Terry, Alfred S. James, Edgar B. Hammond, Benjamin H. Anthony, John I. Paulding, A. R. Pierce, Fred R. Fish, William P. Covell, F. W. Reynolds, Frank B. Sistare, Charles A. Morrison.

### Hempstead Harbor Y. C.

The annual meeting of the Hempstead Harbor Y. C. was held on Saturday, March 6, the officers, board of governors and committees chosen last year were unanimously re-elected. John S. Appleby is commodore, E. P. Titus, vice-commodore, and Ward Dickson, chairman of regatta committee.

# Rifle Range and Gallery.

## Fixtures.

June 12-20.—National Schuetzenbund Festival, Union Hill, Schuetzen Park, N. J.

## Composite Championship Target.

THE composite indoor championship target of the recent indoor contest in Zettler Brothers' gallery, New York, is illustrated herewith:

It was made by Mr. L. C. Buss, of New York, who scored 2456 out of a possible 2500. He shot at a 25-ring target, 75ft., offhand. It is of special interest inasmuch as it shows in one group the whole 100 shots, and is an object lesson in the wonderful steadiness and precision which are indispensable to land a contestant at the head in modern rifle competition.

## The New York Corps.

SEVENTY-FIVE members of the New York Corps were present at the bi-monthly gallery shoot, in the Zettler gallery on March 11. R. Gute was high on the ring target. C. Roffmann won the special prize for the best center shot on the bullseye target. The scores:

Ten-shot scores, 25-ring target, distance 75ft., offhand: R. Gute 247, 246; O. Schwanemann 241, 239, J. N. F. Siebs 239, 235, B. Zettler 237, 237, J. G. Voss 231, 234, H. Haase 234, 230, H. Beckmann 229, 232, J. Facklamm 238, 229, N. C. L. Beversten 226, 241; P. Heidelberger 228, 234, G. Thomas 227, 228; H. Nordbruch 237, 220; J. H. Meyer 226, 228; J. Paradies 228, 225; H. Rottger 229, 224; J. C. Bonn 224, 228; C. Konig 231, 220; W. Dahl 225, 225; G. Offermann 221, 228; W. Schultz 214, 234; L. C. Hagenah 226, 221; Capt. J. H. Hainhorst 223, 222; M. J. Then 222, 223; C. Schmitz 229, 216, H. D. Meyer 224, 221, H. R. Coplan 222, 221; H. B. Michaelen 228, 215, A. Evers 217, 223, H. Winter 214, 228; C. Wahmann 222, 218; H. Gobber 229, 209; J. Jantzen 228, 210; J. H. Doscher 221, 216, F. Dierks 217, 220, A. W. Lemcke 218, 225; Herman Koster 210, 221; J. G. Tholke 207, 222; Adolf Beckmann 209, 217; D. Dede 206, 220; H. Quinten 209, 214; F. Feldhusen 210, 212; F. Schultz 209, 212; D. H. Brinckmann 210, 212; G. Junge 214, 207; J. C. Kruse 223, 198; H. Offermann 210, 210; H. Meyn 216, 203; Aug. Beckmann 202, 214; H. C. Hainhorst 190, 223; Hy. Koster 208, 206; C. Mann 203, 209; C. Roffmann 208, 204; H. Konig 211, 199; H. Heinecke 208, 205; C. Brinckama 198, 211; E. F. Lankenau 190, 218; M. Von Dwingelo 208, 196; W. Schaefer 192, 208; D. Pepper 197, 208; R. Ohms 197, 204; N. W. Haaren 193, 198; J. Gobber 183, 202; J. C. Brinckmann 183, 205; D. Von der Lieth 196, 189; J. May 202, 181; J. H. Grote 210, 178; H. Horenberger 190, 199; Hy. Decker 196, 184; D. Von Glahn 205, 185; H. Haaren 174, 196; N. Jantzen 187, 184; Gus Hagenah 179, 186; B. Kumm 159, 95; D. Ficken 198, 152; H. D. Von Hein 138, 192.

Bullseye target, 4in. carton, the best center shot to count by measurement; one shot: C. Roffmann 35 degrees, G. G. Voss 37, H. Beckmann 46½, J. Facklamm 49½, R. Gute 57, J. Jantzen 59, G. Junge 61½, C. Mann 63½, W. Schaefer 68½, F. Dierks 73 degrees.

## The Worn-Rein Match.

THE fifty-shot gallery match between Gottlieb Worn and Chas. Rein, both of Brooklyn, for \$25 a side, was shot off on Breitkopf's gallery in East New York, Brooklyn, on March 6. In the shooting, Worn showed that Rein was outclassed. He outshot his opponent in every score.

The conditions of the match called for 50 shots, in strings of five.

The match went on for a number of strings, when in rolling up one of Worn's cards it was found to contain six shots. This situation caused a diversion among the cohorts of the two marksmen. The referee, Rosenbaum, was in a dilemma. Worn claimed that he shot only five shots in his target, and said the extra shot came from Rein's stand. Rein claimed that such a thing was impossible. Worn said it was possible, and that he could do it for money. A bet was made, and Worn demonstrated the possibility of his claim by shooting from one stand to the other, hitting the bullseye, thus winning his bet.

The referee finally patched up matters for the time being by deducting a 25 from Worn's target. The match was then continued to the finish, when Worn was declared a winner by 96 points. The old matter of Worn's extra shot was revived by the backers of Rein, and a protest was filed with the stakeholder, forbidding him to turn the stakes over to Worn.

At the last reports from the scene of the contest, the stakeholder was still being held up. The scores follow:

Ten-shot scores, 25-ring target, distance 85ft., offhand; 50 shots: G. Worn, Bal.-Zischang.....238 237 231 234 242—1182 Chas. Rein, Bal.-Stevens.....225 216 214 218 213—1086

The daily press recounts that invitations have been sent to rifle-men in the United States and various foreign countries requesting the appointment of teams to participate in the match for the Palma trophy, which represents the military team championship of the world. The trophy was won by the American team at Bisley, England, July 11, last year, in competition with teams from Great Britain, France, Norway, Canada, Australia and Natal. This year the trophy is to be contested for at Sea Girt, N. J., on or about Sept. 1.

## Cincinnati Rifle Association.

THE following scores were made in regular competition by members of the Cincinnati Rifle Association, at Four-Mile House, Reading Road, March 13. Conditions: 200yds., offhand, at the 25-ring target. Hasenzahl was champion for the day with the fine score of 230. The day was cloudy and a cold east wind prevailed, varying from 10 to 12 o'clock:

Hasenzahl .....	230	222	211	211	203
Payne .....	226	225	225	221	216
Nestler .....	224	214	213	210	209
Trounstine .....	213	199	199	197	193
Freitag .....	210	203	178	177	176
Roberts .....	208	208	205	202	201
Drube .....	208	198	191	...	...
Hoffman .....	205	204	203	201	200
Lux .....	205	200	198	198	197
Hofer .....	204	203	201	198	195
Gindele .....	203	192	...	...	...
Odell .....	200	200	196	196	189
Uckotter .....	198	198	192	183	180

## Zettler Rifle Club.

IN the adjourned weekly shoot of the Zettler Rifle Club some of the active members did not show up. Louis Maurer, who has been absent from the weekly contests for several weeks past, was on hand, and filled in his quota of 50 shots, making a total of 1189. W. A. Tewes was present and set the pace for his clubmates, and finished his 100 shots with a total of 2445.

L. P. Hansen was second with 2437. The scores are appended: Ten-shot scores, 25-ring target, distance 75ft; 100 shots: W. A. Tewes 2445, L. P. Hansen 2437, Aug. Kronsberg 2426, A. Moser 2421, E. Van Zandt 2416, Chas. G. Zettler, Jr., 2421, Chas. G. Zettler, Sr., 2384, B. Zettler 2377, H. Fenwirth 2335, Major A. Rowland 2322.

Fifty shots: H. C. Zettler 1204, W. A. Hicks 1201, Louis Maurer 1189, Aug. Begerow 1179, Thos. H. Keller, Sr., 1178.

## Lady Zettler Rifle Club.

THE members of the Lady Zettler Rifle Club shot their monthly scores at the Zettler gallery, on March 12. Miss Kate Zimmermann added lustre to the family escutcheon by making a full score of 250 points. Miss Millie Zimmermann was first for the two best scores.

Ten-shot scores, 25-ring target, two scores to count, muzzle rest: Miss Millie Zimmermann 494, Miss Kate Zimmermann 493, Miss Anna Koch 493, Mrs. H. Fenwirth 489, Miss F. Muller 488, Mrs. W. H. Turbett 479, Mrs. C. J. Watson 478, Miss Tena Eusner 465, Mrs. Aug. Kronsberg 450, Mrs. Hy. Scheu 461.

# Trapshooting.

## Fixtures.

March 22-25.—Crawfordsville, Ind., Gun Club's tournament.  
March 19.—North Branch, N. J., marchandise target shoot.  
March 23-24.—Allentown, Pa.—Two-day target tournament at Duck Farm Hotel. C. F. Kramlich, Mgr.  
April 1.—Shingle House, Pa.—Oswago Valley Rod and Gun Club seventh tournament. U. S. Dodge, Sec'y, Millport, Pa.  
April 1-2.—Newark, N. J.—Forrester Gun Club tournament.  
April 6.—Sheepshead Bay, L. I.—Eastern amateur target championship, on grounds of Sheepshead Bay, L. I., Gun Club.  
April 6-7.—Bristol, Tenn.—The Interstate Association's tournament, under the auspices of the Bristol Gun Club. S. W. Rhea, Sec'y.  
April 12-13.—Indianapolis, Ind.—Indiana League of Trapshooters' annual tournament.  
April 18-22.—Kansas City, Mo.—J. F. Schmelzer & Son's Arms Co. fourth Interstate midwinter shooting tournament; targets and live birds.  
April 19.—Springfield, Mass., Shooting Club Patriots' Day tournament. C. L. Kites, Sec'y.  
April 19.—Wellington, Mass.—All-day shoot of the Boston Shooting Association. O. R. Dickey, Mgr.  
April 19.—Haverhill, Mass., eighth annual Patriots' Day tournament. S. G. Miller, Sec'y.  
April 19-21.—Paducah, Ky., Gun Club's spring tournament. W. B. Kennedy, Sec'y.  
April 20-21.—Rensselaer (Ind.) Gun Club amateur tournament. Everette Brown, Mgr., Pleasant Grove, Ind.  
April 21.—Easton, Pa.—The Independent Gun, Rifle and Pistol Club's first annual target tournament. Edw. F. Markley, Sec'y.  
April 26.—Greenville, O., Gun Club amateur tournament. H. A. McCaughy, Sec'y.  
April 26-27.—Pittsburg, Pa.—Herron Hill Gun Club tournament. \$100 added. Louis Lautenslager, Mgr.  
April 26-29.—Kansas City.—Spring target tournament, at Blue River Park. R. S. Elliott, Mgr.  
April 27-28.—Americus, Ga.—The Interstate Association's tournament, under the auspices of the Americus Gun Club. H. S. McCleskey, Sec'y.  
April 28.—Brunswick, Me., Gun Club's Fast Day shoot. G. M. Wheeler, Sec'y.  
May 3-4.—Wabash, Ind., Gun Club tournament.  
May 3-5.—Junction City, Kans.—Kansas State Sportsmen's Association annual tournament. E. L. Wetzig, Sec'y.  
May 4-5.—Nashville, Tenn.—The Interstate Association's tournament, under the auspices of the Cumberland Park Driving Club. Charles Eastman, Sec'y.  
May 11-12.—Springfield, O., Gun Club's target tournament. Geo. Morgan, Sec'y.  
May 11-13.—Spirit Lake, Ia.—Iowa State Sportsmen's Association tournament. J. Burmister, Sec'y.  
May 12-13.—Wilmington, Del.—Wawaset Gun Club annual spring tournament. W. W. Foord, Sec'y.  
May 16-18.—Southern Trapshooters' Association's thirteenth tournament at targets, under auspices of Vicksburg, Miss., Gun Club; \$500 added. J. J. Bradfield, Sec'y.  
May 16-21.—York, Pa.—Tournament of Pennsylvania State Sportsmen's Association, under auspices of York City Gun Club. N. M. McSherry, Sec'y.  
May 17-18.—Dubuque, Ia., Gun Club's fifth annual amateur target tournament. A. F. Heeb, Cor. Sec'y.  
May 17-18.—Dallas, Tex.—The Interstate Association's tournament, under the auspices of the Dallas Gun Club. E. A. Mosely, Sec'y.  
May 17-19.—Davenport, Ia.—Cumberland Gun Club's annual amateur tournament. W. F. Kroy, Sec'y.  
May 18.—Boston, Mass., Gun Club annual team target shoot. H. Kirkwood, Sec'y, 23 Elm street, Boston.  
May 18-20.—Columbus, Neb.—Nebraska State Sportsmen's Association's twenty-seventh annual tournament. G. A. Schroeder, Sec'y.  
May 19-20.—Oklahoma City.—Territorial Sportsmen's Association fifth annual tournament; \$300 added money. J. C. Clark, Sec'y.  
May 20.—Charlotte, N. C., Gun Club tournament.  
May 23-25.—Houston, Tex.—Texas State Sportsmen's Association tournament.  
May 24-25.—Marshalltown, Ia., Gun Club two-day target tournament.  
May 24-25.—Mt. Sterling, Ky.—Kentucky Trapshooters' League tournament. Frank Prago, Sec'y, Louisville, Ky.  
May 25-26.—Shamokin, Pa., Gun Club Spring shoot. S. C. Yocum, Sec'y.  
May 30.—Ossining, N. Y., Gun Club Decoration Day target shoot. C. G. Blandford, Capt.  
May 31.—Dayton, O.—Rohrer Island Gun Club spring target tournament. W. E. Kette, Sec'y.  
June 1-3.—Watertown, S. D.—South Dakota State Sportsmen's Association tournament. F. J. Cory, Sec'y.  
June 7-9.—Sioux City, Ia.—Soo Gun Club's tenth annual amateur tournament; added money. W. F. Duncan, Sec'y.  
June 8-10.—Huntington, W. Va.—West Virginia State shoot. F. H. Merrick, Sec'y.  
June 13.—Middleton, Wis., Gun Club tournament. Frank L. Pierstorff, Mgr.

June 14-16.—Akron, O.—Ohio Trapshooters' League target tournament. G. E. Wagoner, Sec'y.  
June 14-16.—New London, Ia., Gun Club midsummer tournament. Dr. C. E. Cook, Sec'y.  
June 14-17.—Warm Springs, Ga.—Target and live-bird tournament. Chas. L. Davis, Mgr.

July 19-22.—Cincinnati, O., Gun Club annual handicap.  
July 27-28.—Grand Forks, N. D.—The Interstate Association's tournament, under the auspices of the Grand Forks Gun Club. W. M. Ferguson, Sec'y.  
Aug. 10-12.—Brantford, Ont.—Dominion of Canada Trapshooting and Game Protective Association's fourth annual tournament. A. B. Cutcliffe, Sec'y.  
Aug. 15-20.—Buffalo, N. Y.—New York State shoot.  
Aug. 15-22.—Indian tournament; place determined later.  
Aug. 24-25.—Hot Springs, S. D.—The Interstate Association's tournament, under the auspices of the Hot Springs Gun Club. H. A. Gayhart, Sec'y.

## DRIVERS AND TWISTERS.

Mr. Charles North, of Cleveland, O., was a visitor in New York for a brief while last week.

The Haverhill, Mass., Gun Club announces their eighth annual Patriots' Day tournament on Patriots' Day, April 19.

At Lake Denmark, N. J., March 11, Mr. A. K. Baker defeated Mr. Charles Munson in a match at 50 birds, \$50 a side, by a score of 47 to 45.

The expert trap shot, Mr. J. S. Fanning, started westward from New York on Tuesday of this week. He will, in his sunshiny way, demonstrate the perfection of the powder which he uses.

The secretary-manager, Mr. J. L. D. Morrison, informs us that the St. Paul, Minn., Rod and Gun Club have fixed upon July 12-14 as dates for their amateur handicap tournament.

A twelve-man team match between the S. S. White and Media gun clubs, at Gorgas Station, Pa., March 12, was very close. The Media team won by a score of 197 to 194. Each man shot at 25 targets.

The Crescent Athletic Club team of trapshooters defeated the Yale team at Bay Ridge last Saturday. The scores were 201 and 185. There were five men to each team, and each shot at 50 targets.

The Ossining, N. Y., Gun Club announces that they will hold an all-day target shoot on Decoration Day, May 30. The programme can be obtained by applying to the club captain, Mr. C. G. Blandford.

The manager, Mr. O. R. Dickey, informs us that the Boston Shooting Association will hold an all-day shoot on Patriots' Day, April 19, on their grounds at Wellington, Mass. The programme will be announced later.

Mr. Edward Banks was a visitor in New York on Monday of this week. His position with the DuPont Powder Company requires his presence in Wilmington, Del., most of the time; therefore, he contemplates a change of domicile from New York to that city.

In the miss-and-out contest for the sterling silver cup, at the shoot of the Keystone Shooting League, Holmesburg Junction, Pa., last Saturday, Dr. Luther Wilson killed 25 straight and won. In an event at 7 birds, Messrs. John Morris and Charles Geikler scored straight.

Concerning the recent announcement that 96,000,000 microbes were found on a greenback by an expert, it was stated that the microbes were harmless; therefore the winners at tournaments may accept their winnings without any undue exhibitions of frantic alarm.

The Eastern three-man team championship, shot on March 9, at Guttenburg, N. J., had four entries. The Jeanette Gun Club, of New York, was the victor on a score of 26 out of a possible 30. The other teams were entered by the Hudson County Gun Club, the East Side Gun Club, and the Orange County Gun Club.

In the programmes of the Interstate series of tournaments for the forthcoming trapshooting season, the following important matter is a part: "That not more than two manufacturers' representatives be permitted to shoot in any one squad, providing the number of entries received at the tournament permits of this arrangement."

A postal card bearing the London, England, post mark, conveys to us the regards of Messrs. A. A. Schoverling and H. S. Welles, who are now sojourning in England. They contemplate a stay of some weeks. Each is an expert trapshooter, and if they engage in any competition there is no doubt but what they will give a good account of themselves.

In the contest for the English Hotel cup, Mr. Jos. Michaelis defeated Mr. S. H. Moore on the grounds of the Indianapolis, Ind., Gun Club, March 12, by a score of 84 to 78. Each contestant shot at 100 targets. Dr. O. F. Britton challenged Mr. Michaelis. The challenge was accepted, and March 26 was fixed upon as the day for the contest.

Mr. G. M. Wheeler, the secretary, informs us that the Brunswick, Me., Gun Club will hold a target shoot on Fast Day, April 28, in the afternoon, and an all-day tournament on July 4. A two-man team match at 100 targets between Messrs. S. Whitmore and Scribner on the one side and Messrs. Wheeler and Webber on the other will be a conspicuous feature.

Trap Around Reading.

READING, Pa., March 5.—The Sixteenth Ward Sportsmen's Field Club held its second shoot of the season at Carsonia Park. Each man shot at 10 birds. Following is the result: Samuel Bobst 9, Frank Schlichter 9, Charles Schell 8, William Wentzel 7, John Sutter 6, and J. Alvin Seifert 7.

Sheridan, Pa., March 10.—The following is the score of the Sheridan Gun Club:

First event, 10 live birds, 28yds. rise: Hartman 5, Ed Weiss 1, Leibig 8, Brill 1, Keller 9, P. Weiss 2.

Second event, 10 live birds: Hartman 6, Leibig 7, Stamm 4, Keller 7, P. Weiss 3.

Third event, 5 live birds: Miller 4, Wolf 4, Weik 3, Stamm 1, Auchenbach 3.

Reading, Pa., March 8.—A shooting match was held on the Spring Valley grounds between N. Robert Tomlinson and William Monsky, of the Perkiomen Gunning Club, and Charles Schell, Sr., and Samuel Schlichter, of the East Reading Rod and Gun Club, for the championship of East Reading and \$25. The match was won by Tomlinson and Monsky, by the following score: Tomlinson and Monsky killed 24; Schell and Schlichter killed 17.

Norristown, Pa., March 5.—Those who journeyed to King-of-Prussia yesterday afternoon witnessed good shooting. Some of the best gunners in the county were in attendance. The shoot was for a hammerless gun valued at \$75. It was a miss-and-out event, 28yds. rise, 50yds. boundary, unknown traps.

Among the shooters entered were Dr. Green, of Chestnut Hill; Park, of Philadelphia; Knipe, of Norristown; Geist, of Fagleyville; Dull, of Hickorytown; Dawson, of Valley Forge, and Hoy, of King-of-Prussia.

Green carried off first prize after killing 18 birds straight. Park did some excellent shooting, but he was unfortunate in having his eighteenth bird drop dead out of bounds. Others who made high scores were Knipe 14, Dull 12, Dawson and Geist 10. The latter killed 10 on each of his two chances.

There were five sweepstake events, in which Mack, of Norristown, carried off first money in three of the events. Dull and Knipe did the best shooting in the other two matches.

Fort Washington, Pa., March 3.—The Fort Side Gun Club held a successful shoot at live birds on its grounds at this place to-day. Well-known wing shots were present from Philadelphia and the surrounding country, and good scores were made. The best scores were:

Ten-bird match: Rotzell 9, Winkle 8.  
Five-bird match: McQuaid 4, Streeper 3.  
Sweepstake shoot: Dr. Blue 9, Duer 8, Jamison 8, Baker 7, Weitz 6, Steer 6, Henley 5, Quod 5.

Oakbrooke, Pa., March 8.—The shooting match held by the Oakbrooke Gunning Club for a fine Holstein cow and calf was held at its headquarters on last Saturday afternoon and was well attended. The high gun was Brown, of Gibraltar, who broke four times 15 straight. Wertz, of Temple, also broke 15. The following broke 14 out of 15: John Kurtz, Frank Wertz, Eshelman, Harner and Kachel. The following broke 13 out of 15: Brendle, Wegman, Yerger and James Kurtz.

Flourtown, Pa., March 3.—The second of the series of five live-bird handicap events being shot by the Flourtown Gun Club on their grounds at this place was largely attended to-day. Frank Henry, of Lansdale, shot high gun of the day and made the only straight score. Richard Dawson, of Valley Forge; Dr. Green, of Chestnut Hill, and Elmer Betson, of Frankford, won out in the sweepstake events. A fine lot of birds, good scores and an interesting day's sport were the features. The scores:

Club shoot, 10 birds: Henry 10, Rotz 9, Dr. Green 9, Dawson 9, Winkle 8, Swartz 8, Everett 8, Betson 8, March 7, Sharp 6, James 6, Hooker 5.

First sweepstake: Dr. Green 7, Dull 6, Henry 6, Betson 5, Jones 5, James 5.

Second sweepstake: Dawson 7, Green 6, Everitt 5, Swartz 5, Winkle 4, Boon 4.

Final sweeps: Betson 8, Henry 7, Green 6, Winkle 5, Swartz 5, Hother 4, Cleaver 4. DUSTER.

Brunswick Gun Club.

BRUNSWICK, Me., March 10.—The annual meeting of the Brunswick Gun Club was held this evening at the office of G. M. Wheeler, and the following officers elected for coming year: President, L. Cecil Whitmore; Vice-President, David W. Scribner; Treasurer, Oscar B. Nason; Secretary, Gilbert M. Wheeler.

The club will hold a shoot on Fast Day afternoon, April 28 and an all-day tournament on July 4. Arrangements and particulars to be formulated later.

On Fast Day afternoon a 100-bird race will be shot by S. Whitmore and Scribner against Wheeler and Webber for the suppers. All shooters cordially invited to attend.

G. M. WHEELER, Sec'y.

Cincinnati Gun Club.

THERE was a large attendance at the grounds on March 12. The day was cloudy. A chilly wind made the conditions far from ideal for the sport. At the time smoke drifted across the grounds, causing some of the shooters to spoil a good score. Considerable shooting was done during the week by different members.

On the 9th Stanley Rhoads, of Columbus, visited the grounds in company with a number of the members. The principal event was at 10 pairs. Six of the members took part.

Ralph Trimble did some good work from 22yds. He leaves on the 14th for Toledo, and will attend the tournament at Crawfordsville on the 22d.

Lou Ahlers appeared at the grounds this week, but did not take part in the shooting on the 12th.

Herman and Col. Bob West have returned from Hot Springs, Ark.

Harig was high man in the cash prize shoot, with 44. Maynard was second with 43, and Roll third with 42. The scores follow:

Ten pairs, March 9: Rhoads 16, Medico 11, Ahlers 14, Don Minto 2, Willie 9, Hinkle 1.

March 12.—Cash prize shoot, 50 targets, distance handicap: Harig (17) 44, Maynard (18) 43, Gambell (16) 43, Roll (18) 42, Boeh (16) 41, R. Trimble (22) 40, Medico (19) 40, Bullerdick (17) 38, Plunkett (16) 38, Block (18) 36, Falk (17) 36, Osterfeld (17) 36, Don Minto (16) 35, Herman (16) 34, Yellow Kid (16) 34, Pohlar (18) 33, Willie Green (17) 32, Linn (18) 31, Pfeiffer (17) 31, Kenan (16) 31, Williams (17) 30, Captain (17) 29, Payne (16) 29, Aekley (16) 28, Muhleman (16) 27, Jack (17) 26, Hake (16) 25.

Match, 25 targets: Gambell 25, Medico 20; total 41. Osterfeld 17, Roll 19; total 36. BONASA.

U. M. C. Southern Squad.

CHARLESTON, S. C., March 8.—Capt. Marshall presented the U. M. C. Southern Squad to the Palmetto Gun Club and their many friends here this afternoon. The weather was all that could be expected, good scores being the feature of the day. In this the professionals were not the only participants. The amateurs participated as well, from whom no doubt we will hear more as the trapshooting year wears on.

Capt. Marshall simply "ate 'em up," but Billy Heer and Pop Heikes kept him "going some" in order to win out. The Charleston sportsmen were much pleased with the exhibition of "Gun Etiquette," and will be glad to repeat their hospitality whenever the Southern Squad journeys South again.

The score follows: Marshall 97, Heer 95, Heikes 94, Budd 88, Anthony 84.

Augusta, Ga., March 9.—Capt. Tom, as he is called by the boys who compose the Squad, made his initial bow to a very large and much interested audience here to-day. Many ladies were besprinkled among the spectators and joined heartily in the applause that greeted Capt. Marshall's short but very interesting remarks.

The shooting of the experts was unusually good considering the weather conditions, "Pop" Heikes, well known as the Grand Old Man of the Traps, keeping well up in the race. Augusta sportsmen will be glad to welcome the return of the U. M. C. Southern Squad, especially the members of the Augusta Gun Club. The scores: Marshall 97, Heikes 96, Budd 92, Heer 85, Anthony 89.

Aquidneck Gun Club.

NEWPORT, R. I.—The eighteenth semi-monthly contest for the L. C. Smith badge was run off on Wednesday afternoon, the goodly number of ten shooters being on hand. Conditions were decidedly hard—a freezing temperature prevailed, while old Boreas did his level best to reduce the scores with a norther which must have blown at least thirty miles an hour. Powel was best man for the sixth time, winning on 40.

We were pleased to have with us Mr. W. T. Smith, who, by his gentlemanly bearing and good shooting, has made many friends with the members. His 10 straight stands out by reason of its being the only one made during the afternoon.

Six members took in the shoot at the Canancket Club at Narragansett Pier, on Saturday, and made creditable scores. Hughes in the cup match went out with 80, and Manchester 83.

Targets:	10	10	10	10	10	Total.
Powel	7	8	8	9	8	40
Smith	5	7	8	9	10	39
Dring	6	6	8	8	7	35
Alexander	9	8	7	4	7	35
Manchester	8	8	7	6	6	35
Bowles	4	7	7	6	6	30
Macomber	5	5	5	6	7	28
Gilbert	8	6	3	5	5	27
Peckham	7	5	3	5	4	24
Hughes	8	7	5	4	6	30

Rohrer's Island Gun Club, Dayton, O.

THE attendance at the shoot on March 9 was good, and the contest one of the most interesting which the club has ever held. Eighteen members took part in the medal shoot. Ten of them scored the full 25, and it required fifteen shoot-offs to decide the winner. In the seventh shoot-off Hanauer and Sapp were left behind. Gerlaugh and Rohrer continued to shoot at 5 targets each until the fifteenth shoot-off, when the former broke straight and Rohrer dropped out.

John W. Gerlaugh, the badge winner, shot at 121 targets to-day and broke 111, over a 90 per cent. gait. George Rohrer made a run of 67 straight, which is the best record made this year by any member of a Montgomery county gun club, barring R. O. Heikes. The scores:

	Shot at.	Broke.		Shot at.	Broke.
Kershner	35	28	Sapp	35	25
Gerlaugh	35	28	Brandenberg	30	24
Schwind	28	27	Schaerf	33	22
Oswald	33	27	Hales	35	22
Clark	30	27	Nohr	26	22
Hanauer	29	26	Wetzel	35	17
Donohue	31	26	Landis	35	16
Rohrer	31	26	Kette	35	16
Kuntz	35	25	Brown	35	15

BONASA.

Cleveland Gun Club.

CLEVELAND, O.—The shoot for the Cuyahoga county badge, on March 9, was a close and interesting contest, and was finally won by F. H. Snow, after shooting off a tie on 45 with Williams. Hogen and Martin were close to the leaders, breaking 44 each. In the shoot-off for the badge, at 25 targets, Snow broke 25 straight, and Williams missed his sixteenth bird. The badge went to Snow. Martin and Hogen tied for first prize. Eadie and Blakeslee for second and Kramer took third on 39. The scores follow:

Cuyahoga county badge shoot, 50 targets; open to all shooters of Cuyahoga county: Williams 45, Snow 45, Martin 44, Hogen 44, Blakeslee 40, Kramer 39, Brown 34, James 34, Eadie 40.

BONASA.

Western Pennsylvania Trapshooters' League.

PITTSBURG, Pa., March 12.—At a meeting of the Western Pennsylvania Trapshooters' League, held Thursday, March 10, eleven clubs joined the League, and letters from eight clubs asking information were read by the secretary.

The yearly dues of \$5 were paid by each club. Officers for the year were elected as follows: J. O'H. Denny, Chairman; Charles G. Grubb, Secretary; Board of Control: R. S. Deniker, L. B. Fleming, Louis Lautenslager.

All clubs in western Pennsylvania are requested to become members of the League.

It is optional with the club joining the League as to whether they give a tournament or not. CHARLES G. GRUBB, Sec'y.

Portage County Gun Club.

THE Portage County Gun Club, of Kent, O., will place in competition this year a handsome gold medal with diamond setting, to be awarded to the shooter making the best record for the season. The club is preparing for a good season of sport.

A clergyman in the West of England, preparing candidates for confirmation, had among them a girl from a neighboring inn, where he frequently called for a glass of their noted home-brewed ale. On asking the usual question, "What is your name?" he was astonished at receiving no reply beyond a disgusted "Humph!" Again asked, "What is your name?" this was more than she could stand, and, turning to the class, she said: "Hark at he them! Comes into our house two or three times a week and says, 'Sallie, fetch I a pint,' and now he axes I wat my name be!"

Oral examination in scripture:  
Clergyman—What is the outward and visible sign of baptism?  
Up-to-date Student—The baby, sir.  
Clergyman (somewhat non-plussed)—Um, ah, yes. And what is your duty toward your neighbor?  
Up-to-date Student—To keep your eye on him, sir.—County Gentleman.

A severe looking Bishop was examining a Sunday school class. "Who made the world?" he thundered, fixing a small girl with his eye. "Please, sir, I didn't," she faltered. The Bishop's eye grew sterner as he glared at her, whereupon she tremblingly and tearfully announced, "Please, sir, if I did, I'll never do it again."

An Englishman touring in Scotland after a week of incessant rain, said to an old Scotchman: "Does it always rain in this place?" "Nae," replied the old man, "sometimes it snaws."—County Gentleman.

### Boston Gun Club.

Boston, Mass., March 9.—"Business before pleasure; but I am through with my business for to-day," was what one of the twenty-three attendants at the Boston Gun Club's Wednesday shoot said upon shooting his first event to-day, and from that on his sole idea was that the rest and enjoyment he would secure from three hours with favorite gun and load amply repaid him for the extra trouble and expense he had been put to to be present at the regular matinee. So it is with the majority of our shooters, as they are mostly well-known business men; but they realize that an afternoon free from business cares, etc., will enable them to tackle with renewed vigor all the morrow's problems. How many more should do the same thing is hard to tell, but there are many that never knew the benefits that can be derived from an afternoon with the gun. But, should they ever find out, we are under the impression it would be the same old story, of not finding enough trapshooting to satisfy them.

More than the usual number of visitors were present to-day, seven facing our trap for the first time, and as many more representing the prominent clubs of Boston and vicinity. A Boston Gun Club shoot would not be a shoot unless we had some newcomers, the general feeling being that all are to be made welcome; and surely, what seems better to a visitor and new shooter than a good-fellowship welcome when visiting a new club ground. No club should forget this part of the programme, as it may be the beginning of a larger membership roll, and a chance for a future Heikes, Gilbert or Crosby being brought forth on its grounds.

Honors of to-day were taken care of by Hodsdon, 19yds. seemingly being no drawback to his shell and powder combination, leading by two targets in the prize match; and, with Woodruff as team partner, leading in the team match. While averaging considerably higher for the afternoon than Getchell, the latter's percentage of 81 per cent. is high average for each event on the programme being entered.

The newly acquired find of the club, Bell, was not much outdone, however, his 15-target events not netting the usual amount, and preventing average from coming his way.

Frank's score in the prize match places him in the lead over Bell, as yet the only two to have finished their complete scores. Capt. Woodruff, though, has begun to move, and will bear watching from now on. All the boys are waiting for this, as they are in hopes of a victim in the three-cornered race between Watertown, Harvard and Boston, and depend largely upon their captain to turn the trick. Other scores:

### Ossining Gun Club.

OSSINING, N. Y.—At a meeting of the Ossining Gun Club held at the Weskora Hotel, Ossining, March 7, it was the sense of the meeting that "inasmuch as A. L. Burns, of Mamaroneck, had won the special prize, four silver candle holders, at the shoot of this club, Lincoln's Birthday, 12th ult., according to his knowledge of the conditions governing the same, that he be awarded the prizes and that this action of the club be forwarded to the sporting papers for publication." C. G. BLANDFORD, Capt.

### Vicksburg Gun Club.

VICKSBURG, Miss., March 5.—Great preparations for our three days' target tournament, to be held here May 16, 17 and 18, are being made, and everything at present points to success. We will add fully \$500 in cash and merchandise, and expect to have in attendance some of the best shots in the United States. Messrs. Hayes, Miller, Dinkins, Fletcher, Pinkston and Bradfield are going to do all in their power to make this one of the record shoots for 1904. Besides the cash and merchandise prizes offered, there will be put in competition some very handsome trophies, to be contested for.

Our sister cities—Greenville, Memphis, Natchez, Shreveport, New Orleans and others—had better start practicing. Our local shots will commence about March 20 to shoot a series for several very handsome prizes; this competition to close on the last day of our tournament. Besides the prizes offered, this series of shoots will enable our local boys to get in thorough practice before tournament time, and perhaps some of us may get in line for the Grand American or the World's Fair shoot, which I note follows right after our tournament.

This will be the thirteenth tournament of the Southern Trapshooters' Association, of which our club is a member. We will do all in our power to make it a success.

We will have some of the finest champions with us May 16, 17 and 18, among whom might be mentioned Crosby, Gilbert, Faurote, Spencer, Riehl, Heikes, Anthony and Kaufman. Of course, these professionals cannot shoot well enough to compete for money, but they like to shoot, and they are always welcome in old Vicksburg. None of them are strangers to us.

Of course, Uncle Tommy Devine will be here, and we also hope against hope to have Geo. Hillman with us.

May is a fine time to visit us. Don't be afraid of sickness. Our old Hill City is the healthiest spot in the United States.

RABBIT.

### New Jersey Pigeon Bill.

WE are informed that the contemplated legislation hostile to pigeon shooting at the traps was defeated in the New Jersey Legislature a few days since. The following, taken from the Observer, shows what powerful forces were organized in support of the anti-pigeon bill:

Trenton, March 8.—President George Morrow McCarthy, of the Hudson County S. P. C. A., who drew the bill introduced by Assemblyman Ernst, of Hudson county, prohibiting the use of live pigeons or other fowl as a target for so-called "sports" to blaze away at a few feet from the muzzle of the guns, called on Governor Murphy and presented to him the petition signed by 10,561 Jersey men against the legalized massacre of innocent birds. The petitions were most extensively signed in the counties that the members of the committee which is holding the bill in committee to kill it misrepresent.

Governor Murphy listened attentively to the remarks of President McCarthy on the demand from all over the State from humanitarians for the passage of the act, and stated that he was heartily in sympathy with the movement to secure the abolition of the cruel sport. He emphatically said that he would do all in his power to secure a report from the Committee on Fish and Game, and he gave Mr. McCarthy every hope that he would succeed.

It was stated around the State House that the Governor would have a big task on hand if he attempted to force the Fish and Game Committee, which has defied public sentiment, to report the anti-pigeon shooting bill. The Governor could do it, it is said, if he would resort to the drastic threat of informing the five members of the committee that he would sign no bill introduced by them which succeeds in passing both houses unless they agreed to report the measure forthwith. The defiant committee could thus be brought to its knees.

### Indianapolis Gun Club.

INDIANAPOLIS, Ind., March 5.—The next three shoots, completing the series, will be shot from a distance handicap, 16 to 21yds., with no targets extra to shoot at.

The scores of the ninth contest for the Julius C. Walk & Son cup follow:

Targets:	25	25	*	Shot at.	Broke.
J W Bell, 21.....	23	24	3	53	50
Gus Moller, 20.....	23	22	5	56	50
S H Moore, 17.....	18	19	13	67	50
J C Dixon, 17.....	18	18	16	69	50
H B Sayles, 17.....	17	15	18	69	50
H N Novice, 16.....	15	15	20	83	50
O F Britton, 21.....	23	24	2	53	49
W T Fugate, 19.....	20	23	6	58	49
J M Lilly, 17.....	16	17	16	75	49
C A Medico, 18.....	17	21	10	65	48
Jos Michaelis, 19.....	22	20	4	58	47
W T Nash, 18.....	22	19	6	60	47
E C Dickman, 19.....	21	21	4	59	46
J E Schroyer, 17.....	17	18	11	71	46
Jos Morgan, 17.....	18	17	10	71	45

O Konstanzer.....	13	..	..	25	13
R Johns.....	10	..	..	25	10
J L Head.....	21	21	..	50	42

\*Number broken out of handicap allowance.

### SIDE LIGHTS OF TRADE.

In the following events Winchester factory loaded shells were used: Dave Curran, of Ennis, Tex., winner of the Houston Chronicle cup at the Sunny South Handicap, was challenged by F. K. Sterritt, of Abilene, to shoot for it on Feb. 22. Curran won. Sterritt posted \$75, which was \$25 more than the conditions called for, for a match on the 23d. Curran won again. He shot a Winchester repeating shotgun. In Omaha, March 5, John Severson, Wisner, Neb., defended his title to the P. L. Combs cup, and beat seven of the Nebraska cracks, including Mr. Diffenderfer, the winner of last year's Grand American Handicap at targets. He also used a Winchester repeating shotgun. W. R. Crosby, at Thomasville, Ga., March 2, broke 97 targets out of 100. At Cordele, Ga., March 4, he broke 99 out of 100. In the amateur class at that shoot, Mr. Marbury won first average, Mr. Aycock second, and Mr. Loyd third. At Americus, Ga., March 5, Crosby broke 98. Mr. Smithwick and Mr. Lee won first and second high averages for amateurs.

The indoor rifle championship of the United States was again won with Peters .22-short cartridges, making an unbroken succession of seven of these important events to the credit of this ammunition. The winning of this event is a severe test of man, weapon and ammunition. In four successive years the average of the winning scores has been 245.5 points out of a possible 250, a mark but little short of perfection. In addition to winning the premier events of the indoor season, Peters ammunition won the prizes in the other matches held in connection with the championship. The new champion is Mr. L. C. Buss, of New York city, whose winning score of 2456 is but 2 points below the record for this event, which was made by Mr. L. P. Ittel, of Allegheny City, Pa., in the contest of 1902. A composite target of this championship contest is presented in our rifle department.

Mr. G. W. McGill won high average for the two days' shoot Feb. 26 and 27, at Woodbine, Toronto, Ont. He also won the handsome silver cup in the live-bird event. Mr. McGill and Mr. Wakefield won the two-man team championship of Canada. Each used Lefever guns. The Lefever gun also won high amateur average at the Michigan State shoot, the Interstate cup at St. Joseph, Mo., killing 25 live birds straight; the challenge trophy at Sioux City, Ia.; also the medal for the championship of central Michigan. Send for one of the Lefever Arms Co. handsome 1904 illustrated catalogues.

Such scores as the following speak volumes for the Parker gun: Fred Gilbert, out of 1,000 targets shot at in nine events, broke 962, or 96.2 per cent. The Sunny South Handicap amateur average was won by M. E. Atchison. Mr. T. W. Morfe holds the championship of New Jersey at live birds. Walter Huff, shooting at 100 targets at Macon, Ga., broke 96; at Columbus, Ga., 94; at Americus, Ga., 96.

Polk Miller's book on "Dogs" costs 3 cents in stamps, to cover postage; otherwise it is absolutely free. No dog man or owner should be without it. Write to the Polk Miller Drug Co., Richmond, Va., for a copy. That firm will charge you nothing to prescribe for your sick dog.

The calendar for 1904, issued by the firm of Parker Brothers, Meriden, Conn., presents twenty-four portraits of eminent shooters, who are users of the Parker gun, with a brief synopsis of their famous doings in competition.

The Winchester Repeating Arms Co., of New Haven, Conn., will be glad to send any one free, upon request, a copy of their "Trapshooter's Guide."

### PUBLISHERS' DEPARTMENT.

#### Rates to St. Louis World's Fair.

Tickets to be sold at very Low Rates via Pennsylvania Railroad.

For the Louisiana Purchase Exposition, to be held at St. Louis, Mo., from April 30 to Dec. 1, 1904, several forms of excursion tickets to St. Louis will be placed on sale by the Pennsylvania Railroad on April 25, as follows:

Season tickets, good to return until Dec. 15, 1904, to be sold daily at rate of \$38.80 from New York.

Sixty-day excursion tickets, final limit not later than Dec. 15, 1904, to be sold daily at rate of \$32.35 from New York.

Fifteen-day excursion tickets to be sold at rate of \$26.25 from New York.

Tickets of the forms named above will be sold from other stations on the Pennsylvania Railroad at proportionate rates.

Ten-day special coach excursion tickets will be sold on May 10, and on other dates to be announced later, good going only on special coach trains, or in coaches on designated trains, and good returning in coaches on regular trains, at rate of \$20 from New York, \$18.50 from Philadelphia, and proportionate rates, approximating one cent per mile, from other points.

Excursion Tickets by Variable Routes.—Season tickets and sixty-day excursion tickets will be sold via variable routes; that is, going by one direct route and returning via another direct route. Variable route tickets will be sold applying through Chicago in one direction at the same rates as apply for season and sixty-day excursion tickets to St. Louis, going and returning via the direct routes.

On all one-way and round-trip tickets, reading to points beyond St. Louis, a stop-over of ten days will be permitted at St. Louis on payment of a fee of \$1 and deposit of ticket.

## Why Not Shoot A BAKER?

Do you know that we build to order special Trap and Field Guns at \$60 and \$75 that, for efficiency and finish, equal most \$100 and \$150 grades of other makes?

MANY MEDIUM AND HIGHER GRADES ALSO.

Send for a copy of the BAKER GUN QUARTERLY containing full information.

**BAKER GUN AND FORGING CO.,**

Cor. Liberty & School Sts., BATAVIA, N. Y.

## MY TRAP SCORES

A pocket trap score book, containing 50 pages of score sheets and the Interstate Association Rules for target and live bird shooting, and for shooting under the Sergeant System. The cover bears the title "My Trap Scores," and the pages, in number and form, are arranged to make a complete record of the shooter's doings at the traps. The pages are ruled to make a record of the place, date, weather conditions, number of traps, number of shooters, gun and load used, events, etc. The score sheets are ruled for 25 targets. Bound in leather. Price, 50 cents.

FOREST AND STREAM PUB. CO., 346 Broadway, New York.

# FOREST AND STREAM.

## A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1904, BY FOREST AND STREAM PUBLISHING CO.

TERMS, \$4 A YEAR. 10 CTS. A COPY.  
SIX MONTHS, \$2.

NEW YORK, SATURDAY, MARCH 26, 1904.

VOL. LXII.—No. 13.  
No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

### CONCERNING BIRDS AND TARGETS.

CORRESPONDENTS who use the improper terms "birds," and "killed," and "kills," when writing for publication on matters pertaining to trap shooting at flying targets, thereby contribute materially to the legal abolition of trapshooting at live birds throughout the United States. Moreover, the foregoing terms, as commonly applied to target shooting, are misnomers. They properly belong to the nomenclature of live-bird shooting. When pervertedly used in matters of trapshooting, they afford general and substantial evidence for the hostile use of the part of the daily press and the humane societies which are actively opposed to pigeon shooting at the traps. The daily press in particular is a powerful educator of the masses.

The public is prone to accept published statements literally. The fact that "birds," and "kills," and "killed," are quite commonly used by trapshooters to denote the breaking of inanimate targets, does not in the least change the idea of slaughter conveyed to the public by those misnomers, nor does it in the least impair the force of such misnomers when presented before legislative bodies as good evidence. By the use of those misnomers, trapshooters have aided materially in educating up a broader and more aggressive public hostility to pigeon shooting at the traps, and amplified hostile evidence for hostile legislation.

The trapshooters, as a class, may accurately comprehend the true significance of the misnomers, but the public at large, without the necessary opportunities, or, perhaps, inclination, to inform itself concerning the nice distinctions of trapshooting colloquialisms or awkward attempts at metaphorical embellishments, is certain to understand the terms according to their literal significance, which also is their true significance in the nomenclature of trapshooting.

The daily press abounds in reports of trapshooting competitions at targets, which refer to targets as "birds," and to breaks as "kills," and those reports are not infrequently furnished by trapshooters themselves.

To the public, the "birds," and "killed," and "kills," convey ideas of the incessant slaughter of countless thousands of "innocent doves," by gun clubs of every city and town in the United States.

If this popular belief of the public is considered from an unprejudiced viewpoint, it is quite justified as a consequent to the common and improper use of the misnomers aforementioned as applied to targets. Under the circumstances, it seems to be quite unfair to scoff at the public for its failure to understand that "bird" does not mean bird at all; and that "kill" does not mean kill at all; and all this in view of the fact that both kill and bird in trapshooting nomenclature actually have their literal significance.

In view of the situation as between accuracy and inaccuracy, and as between the trapshooters as a class and the public at large, the more simple and sensible procedure would be, perhaps, to abandon the pernicious use of the terms as misnomers. The true terms, targets and breaks would not, to the public, convey the idea of big, heartless men with mammoth guns blowing innocent doves into fragments around the horizon; or of wounded doves dying in slow torture in multitudes throughout the country; or of an atmosphere laden with showers of dismembered wings, feet and feathers, and blood and butchery everywhere.

In short, if a trapshooter publishes to the world that there was a shoot at "birds," and that a certain number was "killed," the public is quite justified in accepting the statement literally, and the public cannot justly be accused of stupidity therefor. And, independent of all else, accuracy of statement should be cultivated and observed for its own sake.

### SENATOR ARMSTRONG'S BILLS.

OUR remarks last week respecting Senator Armstrong's bills in the New York Legislature relative to the use of guns by boys under eighteen years of age, were based partly upon ignorance of the law as it is to-day, and partly upon misinformation as to the precise scope of Senator Armstrong's amendments. The prohibition against giving a gun to a boy under eighteen years of age was assumed by us to be a novel proposition: while as a matter of fact, the penal code now contains a provision that any person "who in any city or incorporated village in this State, without the written permission of the chief magistrate, sells or gives any pistol or other firearm [which, of course, includes a shotgun], to any person under the age of eighteen years . . . is guilty of a misdemeanor." No special sense of mortification attends this frank confession of ignorance of the law: probably there are comparatively few citizens of the State who know that having given their sons and nephews guns, may have made themselves amenable to prosecution.

This, then, is the law to-day. Senator Armstrong would amend it by reducing the age limit to sixteen, which is in the line of common sense; and by enlarging the present specification of the statute "pistol or other firearm," to read "gun, revolver, pistol, or other firearm, or loaded or blank cartridges or ammunition therefor." The full text of the amendments is printed in another column, together with a letter from Senator Armstrong explaining the motive and intent of his measures. It is further to be noted that the prohibition of adults carrying arms is restricted to public places, and to the carrying of "any pistol, revolver or other concealed firearm," and would not interfere with the sportsman going afield with shotgun or rifle.

### COLD STORAGE.

ONE vicious quality of the system which permits the storing of game in bond in close season is in the encouragement it gives to excessive killing for market in the open season. The ultimate rule must be the absolute abolition of traffic in wild game, without regard to season or place. Pending the realization of that ideal condition, we should at least confine the selling period to the open season for killing. It is quite practicable for dealers to restrict their purchases to the supply of game that can be disposed of in the open season. On the other hand, if they enjoy the privilege of storing their stock on hand at the close of the open season, they will take all that comes up to the very end, and keep it in storage to be dumped on the market when the next season opens. The New York Association for the Protection of Game is thoroughly right in its contention that the present law providing for the cold storage of game "is opposed to the entire spirit of the game law, as it is solely in the interest of those who keep game in cold storage, and would not hesitate to exterminate all game for present profit." Mr. Prentice's bill in the Assembly to repeal the cold storage provision should have the active support of individuals and clubs and protective associations.

### ALASKA BIG GAME.

The bill introduced into the Senate at Washington to repeal the Alaska game law was discussed by the Committee on Territories, on Thursday last, without final action. The repeal of the bill is earnestly opposed by sportsmen throughout the country, on the ground that such repeal would threaten the extermination of a certain species of large game whose numbers are very scant, and would result in head and hide hunting all through the Territory. Among the reasons urged for the bill are that the bears destroy the settlers' sheep, and that the killing of game is the only means by which the settlers may procure fresh meat.

The bill to repeal the law appears to have been introduced largely under the misapprehension that the present law forbids the killing of game for food and also trapping, and that it is a great hardship to the natives whose subsistence and whose trade are thus largely taken away from them. As we have several times pointed out, the Alaska game law makes special exception in favor of natives, miners and travelers, who may kill for food at all times, and does not prohibit trapping.

If the bill actually did work to the prejudice of the

natives of Alaska, the FOREST AND STREAM would be among the first to urge its repeal, but it does not abridge their rights in any degree, except so far as it does prevent their killing and bringing to market and export the heads and horns of game.

It is not certain how the committee will finally act on the bill, but in view of the fact that at least one member of the committee is well known as an earnest advocate of game protection it is hoped that the present bill will remain in force without substantial change.

### COLORADO'S LAST BUFFALO.

A press despatch of March 20 announces the killing in Colorado of the last of the Lost Park herd of buffalo. The story may be true or not, but even if not true, it foreshadows something that must shortly take place. It is sad to know that a great State whose territory for uncounted ages has been traversed by America's greatest mammal, has lost its last wild specimen of that species.

The little bunch of buffalo within the northwest corner of Colorado close to Wyoming has for years been known as the only wild herd of buffalo left in the United States. The Yellowstone Park buffalo are under the charge of guardians employed by the Government and so are in a sense domesticated animals. The little bunch on the head of Dry Fork and Porcupine rivers in central Montana, is believed to have been utterly destroyed about six or eight years ago, by the Red River half breeds, who made a systematic hunt for them. But in the high mountains and among the dense timber of North Park, in Colorado, about Hahn's Peak and Lost Park there has always been a bunch of buffalo, bison, mountain buffalo, strongwood buffalo—call them what we please—which have held their own bravely, though with constantly diminishing numbers. Every year or two we have read accounts of one, two or three of these animals being killed and smuggled across the Wyoming line into that State, and now we are told the last one has gone!

How inadequate is a \$100 fine as the penalty for killing the last buffalo in Colorado. What does the man deserve who would commit such a deed?

### NIAGARA FALLS.

THE latest and most outrageous grab to be schemed for by the commercial spirit of the age is the water flow of Niagara Falls. If the Niagara Power Company shall secure from the New York Legislature the franchise it is seeking, it will be authorized to divert the water of the Niagara River without limit, even to drawing it off in such volume as to destroy the falls. The people not only of New York, but of the country, are alarmed at the prospect that the Legislature may pass the Thompson bill, giving the company this extraordinary franchise; the press has denounced the scheme, and mass meetings of citizens have voiced the public indignation.

The proposition to destroy, or to make possible the destruction of this unique and stupendous marvel of nature, is so impudent and audacious, that it ought to fasten lasting obloquy and enduring infamy upon the names of those who have presumed to attempt it. Only the dark expedients and hidden ways of legislative corruption could compass it. The passage of the bill would not only make possible the destruction of Niagara's cataract, but it would destroy also the self-respect of the citizens of New York, and make our commercialism a byword with the nations of the earth, and earn for us the execration of posterity.

The fighting that is now going on in Southwest Africa, between the Germans and the native tribe known as Hereros, lends an especial interest to Mr. Frank J. Thompson's article this week on the Zulus of South Africa, with whom he was so closely associated for many years. Mr. Thompson's letter gives in a nutshell the salient characteristics of that interesting race, which for many years has been more or less prominently before the public. The British bill introducing coolie labor in South Africa is one that may have great effect on the future of all the native races there, and if put in force its operation will be watched with great interest.

The paper "With the Gloucester Fishermen," announced for the present issue, has unavoidably been deferred to next week. A new chapter of "Floating Down the Mississippi" will be given next week.

# THE SPORTSMAN TOURIST

## Trails of the Pathfinders.

### IV.—Jonathan Carver.

At the close of the "late war with France," when peace had been established by the Treaty of Versailles, in the year 1763, Jonathan Carver, the captain of a company of provincial troops during the French and Indian War, began to consider how he might continue to do service to his country, and contribute as much as lay in his power to make advantageous to Great Britain that vast territory which had been acquired by that war in North America. What this territory was; how far it extended; what were its products; who were its inhabitants, were some of the questions that suggested themselves to Carver. He was a good patriot, and felt that knowledge as to these points would be of the greatest importance to his country. With the natural suspicion that all Englishmen of his time had for the French, he believed that this race, while they retained their power in North America, had taken every artful method to keep all other nations, particularly the English, ignorant of everything concerning the interior parts of the country. "To accomplish this design with the greatest certainty," he says, "they had published inaccurate maps and false accounts; calling the different nations of the Indians by nicknames they had given them, and not by those really appertaining to them. Whether the intention of the French in doing this, was to prevent these nations from being discovered and traded with, or to conceal their discourse, when they talked to each other of the Indian concerns, in their presence, I will not determine; but whatsoever was the cause from which it arose, it tended to mislead." But Carver contemplated something more important and far reaching than the mere investigation of the country, for he says: "What I chiefly had in view after gaining a knowledge of the manners, customs, languages, soil, and natural products of the different nations that inhabit the back of the Mississippi, was to ascertain the breadth of that vast continent from the Atlantic to the Pacific Ocean in its broadest part, between 43 and 46 degrees north latitude. Had I been able to accomplish this, I intended to have proposed to the government to establish a post in some of those parts about the Straits of Annian [now Puget Sound] which, having been first discovered by Sir Francis Drake, of course belonged to the English. This, I am convinced, would greatly facilitate the discovery of the northwest passage, or a communication between Hudson's Bay and the Pacific Ocean, an event so desirable, and which has been so often sought for, but without success. Besides this important end, a settlement on that extremity of America would answer many good purposes, and repay every expense the establishment of it might occasion. For it would not only disclose new sources of trade, and promote many useful discoveries, but would open a passage for conveying intelligence to China, and the English settlements in the East Indies, with greater expedition than a tedious voyage by the Cape of Good Hope, or the Straits of Magellan would allow of."

Carver's projects for crossing the continent to the Pacific Ocean proved abortive; yet he traveled into the interior nearly as far as any one had hitherto advanced. True, the Verendryes and one or two of the Jesuit Fathers went beyond him on this parallel of latitude; yet the work which Carver published is almost the first that touches on a region lying well within the borders of the Louisiana Purchase, and now one of the most important sections of the United States.

In his introduction, Carver has a prophetic word to say about the unhappy relations existing when he wrote between Great Britain and America. "To what power or authority this new world will become dependent, after it has arisen from its present uncultivated state, time alone can discover. But as the seat of Empire, from time immemorial, has been gradually progressive toward the west, there is no doubt but that at some future period, mighty kingdoms will emerge from these wildernesses, and stately palaces and solemn temples, with gilded spires reaching the skies, supplant the Indians' huts, whose only decorations are the barbarous trophies of their vanquished enemies."

In June, 1766, Carver left Boston for the interior parts of North America. He has little to say about the country lying adjacent to the "back-settlements," which, he observes, have often been described. He passed through the Great Lakes, mentioning as he goes various Indian tribes, and some of the products of the country, stopped some little time at the great town of the Winnebagoes, at Lake Winnebago, in Wisconsin, where he was very civilly received. At this time these people had a queen, or woman chief. He discusses this tribe at some length, and incidentally repeats a curious story: "An elderly chief more particularly acquainted me, that about forty-six winters ago, he marched, at the head of fifty warriors, toward the southwest for three moons. That during this expedition, whilst they were crossing a plain, they discovered a body of men on horseback, who belonged to the Black People; for so they call the Spaniards. As soon as they perceived them, they proceeded with caution, and concealed themselves till night came on; when they drew so near as to be able to discern the number and

situation of their enemies. Finding they were not able to cope with so great a superiority by daylight, they waited till they had retired to rest; when they rushed upon them, and after having killed the greatest part of the men, took eighty horses loaded with what they termed white stone. This I suppose to have been silver, as he told me the horses were shod with it, and that their bridles were ornamented with the same. When they had satiated their revenge, they carried off their spoil, and being got so far as to be out of reach of the Spaniards that had escaped their fury, they left the useless and ponderous burthen, with which the horses were loaded, in the woods, and mounting themselves, in this manner returned to their friends. The party they had thus defeated, I conclude to be the caravan that annually conveys to Mexico the silver which the Spaniards find in great quantities on the mountains lying near the heads of the Colorado river: and the plains where the attack was made, probably, some they were obliged to pass over in their way to the heads of the River St. Fee, or Rio del Nord, which falls into the Gulf of Mexico to the west of the Mississippi."

From the Winnebago town, Carver proceeded up the Fox river, and then carried across a short distance to the Ouisconsin river, and proceeded down that. Here he found the great town of the Saukies, the largest and best built Indian town he ever saw. It consisted of "about ninety houses, each large enough for several families, built of hewn plank, neatly jointed, and covered with bark so compactly as to keep out the most penetrating rains." The streets were regular and spacious; and it appeared more like a civilized town than the abode of savages. About the town lay the plantations of the Indians, in which they raise great quantities of corn, beans, and melons; and their annual product was so large that this place was esteemed the best market for traders to furnish themselves with provisions, of any other within eight hundred miles. Near the mouth of the Wisconsin river, on the banks of the Mississippi, the Ottigamies—Outagami, i. e., "people of the other band," that is the Foxes—had a large town, at a place called "La Prairie les Chiens, which signifies Dog Plains;" a great trading place.

About the first of November, Carver reached Lake Pepin, and speaks with the greatest enthusiasm of the beauty of the country; its apparent productiveness, and the extraordinary number of game and wild fowl seen near about it. On the plains, he says, are the largest buffalo of any in America. In the groves are found great plenty of turkeys and partridges; while great numbers of fowl, such as storks, swans, geese, brants, and ducks frequent the lake. A little below that lake he discovered, in a fine, level, open plain, what had once been a breast-work, about four feet in height, extending the best part of a mile, and sufficiently capacious to cover five thousand men; one of the famous mounds for which the Mississippi valley has so long been celebrated.

About thirty miles above Lake Pepin, near the St. Croix river, Carver met three bands of the Naudowessie (Sioux) Indians; and while he was there, a war party of Chippewas approached the camp, and seemed to be preparing for an attack. The Sioux requested Carver to help them; to put himself at their head and lead them against their enemies. This, the traveler was of course unwilling to do, for his work in the country made it important that he should be friendly with all people. He endeavored to persuade the Sioux to allow him to attempt to make peace with the Chippewas, and when at length they assented, he met the invaders, and succeeded in inducing them to turn back without making an attack. He then persuaded the Sioux to move their camp to another part of the country, lest the Chippewas should change their mind, and return to attack them. Carver declares that this diplomatic success gained him great credit with both Sioux and Chippewas; that to it he was indebted for the friendly reception that he afterward met with the Naudowessie of the Plains; and that, when many months later he reached the village of the Chippewas, further to the north, he was received with great cordiality by the chiefs, many of whom thanked him for having prevented the mischief.

About thirty miles below the Falls of St. Anthony, Carver was shown a remarkable cave of amazing depth, which the Indians called Wacon-teebe; that is to say, "the Dwelling of the Great Spirit." Within it is a lake, which "extends to an unsearchable distance; for the darkness of the cave prevents all attempts to acquire a knowledge of it." The walls are covered with many Indian hieroglyphics, which seem to be very ancient, for time had nearly covered them with moss. The Falls of Saint Anthony greatly impressed Carver, as they did the young Indian in his company.

At the mouth of the River St. Francis, Carver says, "I observed here many deer and caraboes, some elk, with abundance of beavers, otters and other furs. Not far above this, to the northeast, are a number of small lakes called the Thousand Lakes; the parts about which though but little frequented, are the best within many miles for hunting, as the hunter never fails of returning loaded beyond his expectations."

Above the St. Francis river, the Mississippi was new ground, for Hennepin, the river's first explorer, had not passed up it further than the St. Francis, and Carver remarks that, "As this river is not navigable from sea

for vessels of any considerable burthen, much higher up than the forks of the Ohio, and even that is accomplished with great difficulty, owing to the rapidity of the current, and the windings of the river, those settlements which may be made on the interior branches of it, must be indisputably secure from the attacks of any maritime power. But at the same time the settlers will have the advantage of being able to convey their produce to the sea-ports with great facility, the current of the river, from its source to its entrance into the Gulph of Mexico, being extremely favorable for doing this in small craft. This might also in time be facilitated by canals or shorter cuts; and a communication opened by water with New York, Canada, etc., by way of the lakes."

Returning to the north mouth of the river St. Pierre, now the Minnesota river, Carver ascended this about two hundred miles, to the country of the Naudowessie of the Plains. The northern branch of the river St. Pierre, rises, he says, from a number of lakes near the Shining Mountains; and it is from some of these also that a capital branch of the river Bourbon—the York, now Nelson river—which runs into Hudson's Bay, has its sources. All this geography comes from the accounts of Indians, and is clearly misunderstood as to distance and location, for Carver says, also, that the river Messorie, which enters the Mississippi far to the southward, also takes its rise at the head of the river St. Pierre. His distances were very far from right, for he makes the St. Lawrence, the Mississippi, the river Bourbon, and the Oregon, or River of the West (Columbia), head all together in these high mountains.

At the great Sioux camp, which he came to on this river, and which he estimated to contain a thousand people, most of whom had never seen a white man, he was most hospitably received. He spent the winter with them, studying their language, acquiring so far as possible a knowledge of the geography of the country, and at last, with a considerable portion of the camp, returning down the river to the Great Cave, and to the burial ground which lay near it. Before parting with the Sioux he held a council with them, at which long speeches were made by both Englishmen and Indians, and finally, Carver left them to return to La Prairie du Chien, where there were some traders from whom he purchased goods for his further journey.

Among the places now well known which Carver visited, was what he calls the Red Mountain, from which the Indians get a sort of red stone out of which they hew the bowls of their pipes. This is, no doubt, the pipestone quarry, described by Catlin, and now owned by the Sioux Indians, which it has been proposed that the Government shall purchase as a park. Carver says, also, that in some of these parts is found a black hard clay, or rather, stone, of which the Indians make their family utensils.

Carver was much impressed by the beauties of the country through which the River St. Pierre (Minnesota river), flowed; of which he says: "Wild rice grows here in great abundance; and every part is filled with trees, bending under their loads of fruit, such as plums, grapes, and apples; the meadows are covered with hops, and many sorts of vegetables; whilst the ground is stored with useful roots, with angelica, spikenard, and ground-nuts as large as hen's eggs. At a little distance from the sides of the river are eminences, from which you have views that cannot be exceeded even by the most beautiful of those I have already described; amidst these are delightful groves, and such amazing quantities of maples, that they would produce sugar sufficient for any number of inhabitants."

Carver at length reached La Prairie du Chien, and after attending to various matters there, returned up the Mississippi to the place where the Chippewa river enters it, a little below Lake Pepin. Here he engaged an Indian pilot, and instructed him to steer toward the Ottowaw Lakes, which lie near the head of that river. About thirty miles from the mouth, Carver took the easternmost of the two branches and passed along through the wide, gently flowing stream. "The country adjoining to the river," he says, "for about sixty miles, is very level, and on its banks lie fine meadows, where larger droves of buffaloes and elks were feeding, than I had observed in any other part of my travels. The track between the two branches of this river is termed the Road of War between the Chipeway and Naudowessie Indians." Near the head of the stream he came upon a Chippewa town, the houses built after the Indian manner, and having neat plantations behind them. He then carried over to the head of the river St. Croix, descended one of the branches, and then ascended another; and on both streams he found several mines of virgin copper. Then carrying across a height of land and descending another stream, he found himself on Lake Superior, and coasted along its western shores until he reached the Grand Portage, between Lake Superior and Lac la Pluie, or Rainy Lake.

Here were met a large party of Killistnoe and Assinipoil Indians, "with their respective kings and their families." They had come to this place to meet the traders from the east, who were accustomed to make this their road to the northwest. From these Indians Carver received considerable geographical information about the country to the westward, much of which, however, is too vague to be very valuable. Many of the great lakes to

the westward were mentioned and described, and some of them are readily recognized. Such are Lake Winnepeek, Lac du Bois, and Lac le Pluye, or Rainy Lake. Of the country about Lake Bourbon, and Lake Winnepeek, it is said that there are found some buffalo of small size, which are fat and good about the latter end of summer. This difference in size Carver attributes to their northerly situation; "just as the black cattle of the northern parts of Great Britain differ from English oxen." But it is quite possible that these "small buffalo" may perhaps have been musk-oxen, and that their location may have been wrong.

"These Indians informed me that to the northwest of Lake Winnepeek lies another whose circumference vastly exceeded any they had given me an account of. They describe it as much larger than Lake Superior. But as it appears to be so far to the northwest, I should imagine that it was not a lake, but rather the Archipelago or broken waters that form the communication between Hudson's Bay and the northern parts of the Pacific Ocean."

As already stated, Carver believed that the headwaters of the Missouri were not far from the headwaters of his St. Pierre river. The Indians told him that they frequently crossed over from the head of that stream to the Missouri. The nearest water to the head of the Minnesota river is Big Sioux river, in Dakota, which is, in fact, a tributary of the Missouri.

The ethnological information there gathered was as little trustworthy as that concerning the geography of the more distant parts.

For example, it is said that in the country belonging to the Pawnees, and the Pawnauees, nations inhabiting some branches of the Messorie river, mandrakes are frequently found, a species of root resembling human beings of both sexes; and that these are more perfect than such as are discovered about the Nile in Nether-Ethiopia.

"A little to the northwest of the heads of the Messorie and the St. Pierre, the Indians further told me, that there was a nation rather smaller and whiter than the neighboring tribes, who cultivate the ground, and (as far as I could gather from their expressions), in some measure, the arts. To this account they added that some of the nations, who inhabit those parts that lie to the west of the Shining Mountains, have gold so plenty among them that they make their most common utensils of it. These mountains (which I shall describe more particularly hereafter) divide the waters that fall into the South Sea from those that run into the Atlantic.

"The people dwelling near them are supposed to be some of the different tribes that were tributary to the Mexican kings, and who fled from their native country to seek an asylum in these parts, about the time of the conquest of Mexico by the Spaniards, more than two centuries ago." After a brief discussion of the reasons which may have led these supposed immigrants, and the Winnebagoes, to leave their southern home for the north, Carver speaks at some length of the Shining or Rocky Mountains, just mentioned.

"That range of mountains, of which the Shining Mountains are a part, begin at Mexico, and continuing northward on the back or at the east of California, separate the waters of those numerous rivers that fall either into the Gulf of Mexico or the Gulf of California. From thence continuing their course still northward, between the sources of the Mississippi and the rivers that run into the South Sea, they appear to end in about forty-seven or forty-eight degrees of north latitude; where a number of rivers arise, and empty themselves either into the South Sea, into Hudson's Bay, or into the waters that communicate between these two seas.

"Among these mountains, those that lie to the west of the river St. Pierre, are called the Shining Mountains, from an infinite number of crystal stones, of an amazing size, with which they are covered, and which, when the

sun shines full upon them, sparkle so as to be seen at a very great distance.

"This extraordinary range of mountains is calculated to be more than three thousand miles in length, without any very considerable intervals, which I believe surpasses anything of the kind in the other quarters of the globe. Probably in future ages they may be found to contain more riches in their bowels than those of Indostan and Malabar, or that are produced on the Golden Coast of Guinea; nor will I except even the Peruvian mines. To the west of these mountains, when explored by future Columboes or Raleighs, may be found other lakes, rivers and countries, full fraught with all the necessities

ing over the lake, in the hope that they might be seen, the chief priest of the Crees informed those who were with him that he would endeavor to obtain information from the Great Spirit as to when the traders would arrive. Carver gave little heed to the suggestion, supposing it to be merely a juggling trick; but the chief of the tribe advised him that the priest had made this offer chiefly for the purpose of allaying his anxiety, and at the same time to convince Carver of his ability to talk with the Great Spirit.

"The following evening was fixed upon for this spiritual conference. When everything had been properly prepared, the king came to me and led me to a capacious tent, the covering of which was drawn up, so as to render what was transacting within visible to those who stood without. We found the tent surrounded by a great number of the Indians, but we readily gained admission, and seated ourselves on skins laid on the ground for that purpose.

"In the centre I observed that there was a place of an oblong shape, which was composed of stakes stuck in the ground, with intervals between, so as to form a kind of chest or coffin, large enough to contain the body of a man. These were of a middle size, and placed at such a distance from each other, that whatever lay within them was readily to be discerned. The tent was perfectly illuminated by a great number of splinters cut from the pine or birch tree, which the Indians held in their hands.

"In a few minutes the priest entered; when an amazing large elk's skin being spread

on the ground, just at my feet, he laid himself down upon it, after having stript himself of every garment except that which he wore close about his middle. Being now prostrate upon his back, he first laid hold of one side of the skin, and folded it over him, and then the other; leaving only his head uncovered. This was no sooner done, than two of the young men who stood by took about forty yards of strong cord, made also of an elk's hide, and rolled it tight around his body, so that he was completely swathed within the skin. Being thus

bound up like an Egyptian mummy, one took him by the heels and the other by the head, and lifted him over the pales into the inclosure. I could now also discern him as plain as I had hitherto done, and I took care not to turn my eyes a moment from the object before me, that I might the more readily detect the artifice, for such I doubted not but that it would turn out to be.

"The priest had not lain in this situation more than a few seconds, when he began to mutter. This he continued to do for some time, and then by degrees grew louder and louder, till at length he spoke articulately; however, what he uttered was in such a mixed jargon of the Chippeway, Ottawa, and Kiklistinoo languages, that I could understand but very little of it. Having continued in this tone for a considerable while he at last exerted his voice to its utmost pitch, sometimes raving and sometimes praying, till he had worked himself into such an agitation that he foamed at his mouth.

"After having remained near three-quarters of an hour in the place, and continued his vociferation with unabated vigor, he seemed to be quite exhausted, and remained speechless. But in an instant he sprang to his feet, notwithstanding at the time he was put in, it appeared impossible for him to move either his legs or arms, and shaking off his covering, as quick as if the bands with which it had been bound were burned asunder, he began to address those who stood around, in a firm and audible voice. "My Brothers," said he, "the Great Spirit has deigned to hold a talk with his servant at my earnest request. He has not, indeed, told me when the persons we expect will be here, but to-morrow, soon after the sun has reached his highest point in the heavens, a canoe will arrive, and the people in that will inform us when the traders will come." Having said this, he

A MAN AND WOMAN OF THE NAUDOWESSIE.

or luxuries of life; and where future generations may find an asylum, whether driven from their country by the ravages of lawless tyrants, or by religious persecutions, or reluctantly leaving it to remedy the inconveniences arising from a superabundant increase of inhabitants; whether, I say, impelled by these, or allured by hopes of commercial advantages, there is little doubt but their expectations will be fully gratified by these rich and unexhausted climes."

The pages which Carver devotes to a description of

A MAN AND WOMAN OF THE OTTIGAUMIES.

From Carver's "Travels Through the Interior Parts of North America." Edition 1778.

the unknown country to the west, are inserted in his account while he was sojourning with these Crees and Assiniboines, at the Grand Portage. There were more than three hundred people in the camp, and as they waited for the traders who did not come, their stock of provisions began to run low; and the coming of the traders was awaited with an impatience that increased day by day.

It was during this season of waiting that Carver had an opportunity to witness one of those prophecies by a priest, or medicine man, which even in modern times have puzzled many cool and clear heads; and though the story of what he saw is long, yet it may be worth while to give his account of it in full. It appears that one day while all were expressing their hopes for the early arrival of the traders, and were sitting on the hill look-

stepped out of the inclosure, and after he had put on his robes, dismissed the assembly. I own I was greatly astonished at what I had seen, but as I observed that every eye in the company was fixed on me with a view to discover my sentiments, I carefully concealed every emotion.

"The next day the sun shone bright, and long before noon all the Indians were gathered together on the eminence that overlooked the lake. The old king came to me and asked me whether I had so much confidence in what the priest had foretold as to join his people on the hill, and wait for the completion of it? I told him that I was at a loss what opinion to form of the prediction, but that I would readily attend him. On this we walked together to the place where the others were assembled. Every eye was again fixed by turns on me and on the lake; when just as the sun had reached his zenith, agreeable to what the priest had foretold, a canoe came round a point of land about a league distant. The Indians no sooner beheld it, than they sent up an universal shout, and by their looks seemed to triumph in the interest their priest thus evidently had with the Great Spirit.

"In less than an hour the canoe reached the shore, when I attended the king and chiefs to receive those who were on board. As soon as the men were landed, we walked all together to the king's tent, where according to their invariable custom we began to smoke; and this we did, notwithstanding our impatience to know the tidings they brought, without asking any questions; for the Indians are the most deliberate people in the world. However, after some trivial conversation, the king inquired of them whether they had seen anything of the traders? The men replied, that they had parted from them a few days before, and that they proposed being here the second day from the present. They accordingly arrived at that time, greatly to our satisfaction, but more particularly to that of the Indians, who found by this event the importance both of their priest and of their nation greatly augmented in the sight of a stranger.

"This story I acknowledge appears to carry with it marks of great credulity in the relator. But no one is less tainted with that weakness than myself. The circumstances of it I own are of a very extraordinary nature; however, as I can vouch for their being free from either exaggeration or misrepresentation, being myself a cool and dispassionate observer of them all, I thought it necessary to give them to the public. And this I do, without wishing to mislead the judgment of my readers, or to make any superstitious impressions on their minds, but leaving them to draw from it what conclusions they please."

The arrival of the traders, so anxiously looked for, did not greatly help Carver, who found that he could not procure from them the goods that he desired, and shortly afterward he proceeded eastward, having coasted around the north and east shores of Lake Superior. He describes the lake, and the various peoples who inhabit its borders, most of whom are Chippewas. During his trip, he found native copper on a stream running into the lake on the south, and describes how large a trade might be made in this metal, which, as he says, "costs nothing on the spot, and requires but little expense to get it on board; could be conveyed in boats or canoes through the Falls of St. Marie to the Isle of St. Joseph, which lies at the bottom of the straits near the entrance into Lake Huron; from thence it might be put on board large vessels, and in them transported across that lake to the Falls of Niagara; there being carried by land across the Portage, it might be conveyed without much more obstruction to Quebec. The cheapness and ease with which any quantity of it may be procured, will make up for the length of way that it is necessary to transport it before it reaches the seacoast, and enable the proprietors to send it to foreign markets on as good terms as it can be exported from other countries." Stockholders in the Calumet and Hecla and in other Lake Superior copper concerns are requested to take notice.

The fishing of Lake Superior impressed Carver as much as it has other travelers. Of these fish he says: "The principal and best are the trout and sturgeon, which may be caught at almost any season in the greatest abundance. The trout in general weigh about twelve pounds; but some are caught that exceed fifty. Besides these, a species of white fish is taken in great quantities here, that resemble a shad in their shape, but they are rather thicker, and less bony; they weigh about four pounds each, and are of a delicious taste. The best way of catching these fish is with a net; but the trout may be taken at all times with the hook. There are likewise many sorts of smaller fish in great plenty here, and which may be taken with ease; among these is a sort resembling a herring, which are generally made use of as a bait for the trout." The foot of the Sault Ste. Marie, which Carver calls the Falls of St. Marie, is noted by him as "a most commodious station for catching the fish, which are to be found there in immense quantities. Persons standing on the rocks which lie adjacent to it, may take with dipping nets, about the months of September and October, the white fish before-mentioned; at that season, together with several other species, they crowd up to this spot in such amazing shoals that enough may be taken to supply, when properly cured, thousands of inhabitants throughout the year."

Passing now through the Straits into Lake Huron, this body of water is described, and attention called to the rise and fall of the waters, which Carver says is not diurnal, but occurs in periods of seven years and a half. Still going eastward, the town of Detroit was reached, and something given of its history in recent years, and especially of the conspiracy of Pontiac, and the death of that chief.

In Lake Erie, Carver noticed the islands near the west end, so infested with rattlesnakes that it is very dangerous to land on them; and also the great number of water-snakes, which lie in the sun on the leaves of the large pond lilies floating on the water.

"The most remarkable of the different species that infest this lake is the hissing-snake, which is of the small speckled kind, and about eighteen inches long. When anything approaches, it flattens itself in a moment, and its spots, which are of varied dyes, become visibly brighter through rage; at the same time it blows from its mouth with great force a subtle wind, that is reported

to be of a nauseous smell; and if drawn in with the breath of the unwary traveller, will infallibly bring on a decline, that in a few months must prove mortal, there being no remedy yet discovered which can counteract its baneful influence." Still proceeding eastward, the author continues to describe the country, mentioning many well-known lakes, and the people about them.

This concludes Carver's journey, but by no means his book, of which the remaining two-thirds are devoted to the manners and customs of the Indians, with a chapter giving vocabularies of several languages, and other chapters treating of the fauna and flora of the vast region passed over. Like most writers about the Indians, he discusses their origin, quoting a great number of authors from the discovery of America to the time of his writing; the last of these, Adair, who, as is well known, devoted a very considerable work to proving to his own satisfaction that the Indians were the lost tribes of Israel. Carver announces that he is of the opinion that "the North American continent received its first inhabitants from the islands which lie between the extremities of Asia and America, viz., Japon, Yesso, or Jedso, Gama's Land, Behring's Isle, with many others;" to which he adds a cluster of islands that reach as far as Siberia, which may possibly be the Aleutian Islands. To support this conclusion, he advances many cogent arguments, and announces that "that great and learned historian Doctor Robinson," is of the same opinion with him.

Concerning the persons and dress of the Indians, Carver has much to say. He notices many things still well known, and speaks of certain others that are so long obsolete as to be almost forgotten. Thus, he declares that: "It is also a common custom among them to bore their noses, and wear in them pendants of different sorts. I observed that sea shells were much worn by those of the interior parts, and reckoned very ornamental; but how they procured them I could not learn: probably by their traffick with other nations nearer the sea." Another custom noted, which has long been obsolete, but is still remembered by the most ancient persons of some of the western tribes, is the woman's fashion of dressing the hair. To the west of the Mississippi, he says, the Sioux and Assiniboine women "divide their hair in the middle of the head, and form it into two rolls, one against each ear. These rolls are about three inches long, and as large as their wrists. They hang in a perpendicular attitude at the front of each ear, and descend as far as the lower part of it."

The characteristics of the Indians; their method of reckoning time; their government; division into tribes; chiefs; their food; dances and many other matters, are described at great length; as is also their hunting, their manner of making war, and, incidentally, the defeat of Braddock, and the massacre of the people under Col. Monroe, at Fort William Henry. Carver, himself, appears to have been with the prisoners, of whom so many were massacred on that unhappy day; but he, himself, at length reached Fort Edward in safety. He tells something, also, of the way in which the Indians have tortured their captives, and speaks of the Illinois Indian brought into the town of Ottigamies, who was bound to a tree while all the small boys in the village were permitted to amuse themselves by shooting arrows at the victim. As none of the boys were more than twelve years old, and they were placed at a considerable distance, their arrows did little more than pierce the skin; so that the prisoner stood for more than two days pierced with these arrows. During all this time he sung his warlike exploits, told how much injury he had inflicted on his enemies, and endeavored with his last gasp to incite his tormentors to greater efforts, in order that he might give still greater proofs of his fortitude.

Following the chapter on war comes one on their methods of making peace; then one on games, marriage, religion, and character. The last hundred pages of the volume treats "Of the Beasts, Birds, Fishes, Reptiles, and Insects, which are found in the interior parts of North America." Of the larger mammals a catalogue is given from which two or three descriptions may be taken.

"The Carabou. This beast is not near so tall as the moose, however, it is something like it in shape, only rather more heavy, and inclining to the form of an ass. The horns of it are not flat as those of an elk are, but round like those of the deer; they also meet nearer together at the extremities, and bend more over the face than either those of the elk or moose. It partakes of the swiftness of the deer, and is with difficulty overtaken by its pursuers. The flesh of it likewise is equally as good, the tongue particularly is in high esteem. The skin being smooth and free from veins is as valuable as shamoy."

"The Carcajou. This creature, which is of the cat kind, is a terrible enemy to the preceding four species of beasts. He either comes upon them from some concealment unperceived, or climbs up into a tree, and taking his station on some of the branches, waits till one of them, driven by an extreme of heat or cold, takes shelter under it; when he fastens upon his neck, and opening the jugular vein, soon brings his prey to the ground. This he is enabled to do by his long tail, with which he encircles the body of his adversary; and the only means they have to shun their fate, is by flying immediately to the water, by this method, as the carcajou has a great dislike to that element, he is sometimes got rid of before he can effect his purpose."

There is a very long description of the beaver, and its extraordinary intelligence.

The list of birds, too, is a long one; but that of the fishes is very short. To snakes, as might be imagined, much space is given; but to insects very little. Carver describes the lightning bug, but adds: "Notwithstanding this effulgent appearance, these insects are perfectly harmless; you may permit them to crawl upon your hand, when five or six, if they freely exhibit their glow together, will enable you to read almost the finest print."

Trees, plants and shrubs are all described, and among them the wild rice, of which Carver says: "In future periods it will be of great service to the infant colonies, as it will afford them a present support until in the course of cultivation other supplies may be produced; whereas in those realms which are not furnished with this bounteous gift of nature, even if the climate is temperate and the soil good, the first settlers are often exposed to great hardships from the want of an immediate resource for necessary food."

In his appendix, Carver sums up conclusions drawn

from his extensive travels in, and wide knowledge of, the interior of the continent. He has faith in the discovery of a northwest passage, and believes that the Hudson's Bay would be a safe retreat for the adventurous navigators who might try, at first unsuccessfully, a northwest passage. He even names a certain Richard Whitworth, gentleman, of England, who had purposed pursuing nearly the same route as Carver, and having built a fort at Lake Pepin, to have proceeded up the river St. Pierre, crossed over to the river Messorie, till, having discovered the source of the Oregon, or River of the West, he would have sailed down that river to the place where it is said to empty itself near the Straits of Anian. Carver was to have accompanied this Mr. Whitworth on his explorations, and many of the preparations had been made for the trip, "when the present troubles in America began, which put a stop to an enterprise that promised to be of inconceivable advantage to the British dominions."

So, the War of the Revolution put an end to Carver's western explorations. GEO. BIRD GRINNELL.

## Zulu Habits and Customs.

OF course, on my first arrival in Natal, South Africa, I was brought in contact with the native tribe of Zulus, but did not begin to study their traits and characteristics until making preparations for my first trip into the interior, when I found that I could not induce a single one to accompany me. I began to despair of being successful, when I fortunately made the acquaintance of a son of the Commissioner of Native Affairs, the Government official who has charge of all native business, and they look up to him as the great head of their nation. On mentioning my dilemma to him, he kindly offered to extricate me, and explained the reason of my failure. Whenever a Zulu applies for a situation, he has to undergo an examination to see that he does not bear the marks of a lash on his shoulders and back. On the slightest provocation, a Boer will make a vigorous application of the sjambok (a rawhide whip), and as my intended journey would be almost entirely in the Boer country, the Zulus were afraid of my not preventing them from using their favorite implement of torture. He spoke to my help, guaranteeing that I would not allow them to be whipped, whereupon they unanimously decided to accompany me. Thereafter I never had the slightest difficulty in procuring help, as those who had previously accompanied me bore witness to my constant protection.

Soon as one mixes among the Zulus, they will notice some peculiarity about him, and give him a nickname, having reference to this characteristic, by which he will be known throughout the entire country. On my arrival in Natal I wore a full beard and mustache, while the colonists generally sported the mustache alone. Thereupon the Zulus christened me "the man without a mouth," and I would frequently meet parties of them who had never seen me before, when I would be saluted with the following remark: "Ugh! the man without a mouth." The Boers have followed this custom, and my sobriquet with them was "the wolferman." Their name for the hyæna is wolfer, and they could not understand why I should pay them for one of the greatest nuisances from which they suffered, as their flocks of sheep were constantly curtailed by them.

The Zulus are a brave, shrewd and superstitious race; a belief in witchcraft is common among them, and they generally endeavor to propitiate an evil spirit, instead of worshipping a good one. By nature they are herdsmen, and they therefore do not show much liking for agriculture, using every effort to increase the herds of cattle, which form almost their entire wealth. They are tall and slimmer than the negro, and exceedingly active. They are of a dark brown color, with black and curly hair, and give forth the same odor as the negro; but their lips are not so prominent, and the nose in higher and not so flat.

Polygamy is universal, and when a Zulu has two wives he is independently wealthy, as the women build the huts and cultivate the crops of Indian and Kafir corn, while the husband lies around doing nothing, except occasionally indulging in a pipe of dried hemp leaves, which at first renders him frantic and incoherent, until he falls into a senseless state, which lasts for some time before he becomes perfectly conscious. The pipe used is an adaptation of the hubble-bubble, being made of a cow's horn, with the stem inserted near the point and long enough to raise the bowl above the water, which is put in the horn. The lips are inserted in the large end, which is trimmed so as to make a close fit around the mouth, and the smoke sucked up through the water.

A Zulu's food consists almost entirely of corn meal mush and milk, the corn being pounded to an extraordinary fineness and boiled for quite a length of time. When thoroughly cooked, all squat around the pot and help themselves by means of long-handled wooden spoons, which are of native manufacture. During my residence in Natal there was a law compelling every one to furnish each Zulu in his employ with three pints of Indian meal per day, which was really more than could be eaten, and I found that by purchasing a neck piece of beef thrice a week there was a considerable reduction in my outlay for food. Besides, the natives enjoyed it so much the more, as they had never been accustomed to meat for diet, and were fairly frantic to get at it.

During my trips to the interior my rifle usually kept the larder filled with game, which was about our sole nutriment. So sure as I hired a new Zulu, I found that in a short time he became sick from over-eating, and my constant remedy was a huge dose of castor oil, which the patient would gulp down with the greatest eagerness and then wipe the remains out of the cup with his finger and lick it off with gusto, so as not to lose a drop of the greasy material.

Their wages were fixed by law at 5 shillings and rations per month, and so soon as one received ten shillings in silver, his great anxiety was to change it into gold, so that it could be concealed more easily. At one time the banks were short of half sovereigns,

as so many had been hoarded and hidden by the natives, for the purpose of purchasing cows. A queer instance of this habit once occurred with my gang, in order to thoroughly understand which it will be necessary to give a rough description of a Zulu hut. To construct one, a lot of poles are cut and planted in a circle. The tops are then drawn in and lashed together, forming a dome-like framework, which is thatched with grass, leaving an opening at the summit for the escape of the smoke, and another at the side to serve as a door, which is so low that it is requisite to go down on the hands and knees in order to make an entrance. By some carelessness the hut of my gang caught on fire and burnt like a tinder. So soon as the complete structure was reduced to ashes, there was an instantaneous rush of its occupants, who commenced digging at sundry spots and quickly unearthed their store of half sovereigns, which had been buried for safety.

So soon as a young Zulu collects enough cows to purchase a wife, he hunts around until he finds a damsel whose father is willing to sell, provided the price is satisfactory. After the sale has been concluded, there is a carousal entitled "dancing in," after which the husband leaves his child wife in the care of her parents, while he seeks some occupation by which he can accumulate enough bovine currency to make a second purchase, which renders him affluent, as his two wives will release him from all labor. Henceforth his sole solicitude is that a majority of his progeny will be females, which in the due course of time are parted with at the highest market price, thereby increasing his herd, which is looked after by his male children, who continue in this service until they are old enough to get employment elsewhere and gain enough coin to purchase cows and follow in the footsteps of their provident father.

During my residence in Natal, the supply of damsels became so scant that their price ran so high as to prevent the young men from investing. Whereupon the Commissioner of Native Affairs conceived a scheme, by which he relieved the ill-feelings of the young men and created a source of revenue for the colony. He got the Colonial Parliament to pass a law which fixed a limit on the price of damsels, except those of chiefs, and every man who wished to secure a helpmate was forced to go to the nearest magistrate, who would issue a marriage license for a named fee, which went to increase the Colonial revenue. It proved to be immensely popular with the young men, who were a majority of the native population, and also with the colonists, who ignored the justification of polygamy, in order to lessen their taxation. Just after the bill was passed I reached Ladysmith on my way up into the interior on the day appointed by the Commissioner to proclaim the law to the natives. He was received by an enormous crowd, the younger portion of which continuously shouted his praises. Previous to marriage a Zulu wears his hair au naturel; but after wedlock the crown of the head is shaved and the hair immediately surrounding the circlet is colored white, while the balance is interlaced and arranged into various kinks, plaits, etc., which are kept in order by the use of a very singular pillow. It is made of a piece of wood hewn out in the shape of a plank, about fourteen inches in length by six in width, which is carved with various designs, and the upper edge consists of two concavities for the purpose of supporting the neck, thus allowing the knotted portion of the hair to project beyond, and I often wondered how one could enjoy a refreshing slumber with such an uncomfortable rest for the head.

The first requisite for one, on his arrival among the Zulus, is to acquire a smattering of the language, which is highly sonorous and pleasing. The commencement is usually made with what is colonially termed as kitchen Kaffir, of which the following is an example. Soon after arising in the morning I would call out to my body servant, "January, cook kettle." A short time afterward I would be addressed as follows: "Kettle cookeelee, M'kos," which, freely translated, means "the kettle is boiling Boss." It is wonderful how quickly the children of the colonists acquire a knowledge of the Zulu language, which is attributable to their being cared for by Zulu boys, as the females are not allowed to enter into service. During my residence in Durban I never saw a native female servant. Among the Boers I noticed a small number, but comparatively few, and they were of the tribe known as Fingoes.

Before the building of the railway from Durban to Pietermaritzburg and Pretoria, the mails were carried by Zulus, who tramped in various directions throughout the colony. They would start from Durban about sunset with the bags on their shoulders, and arrive in Pietermaritzburg, between fifty and sixty miles, before daylight the next morning, there being but one relay on the route, and I have frequently seen them lying asleep in the portico of the post-office with the mail bags serving as pillows.

The milk supply of Durban was brought in by Zulu boys, perfectly naked, with the bottles slung around their necks. They usually stopped in front of my shanty on the outskirts in order to put on coarse colonial shirts, as there was a municipal ordinance forbidding the entrance of a naked Kaffir into the corporate limits. A Zulu girl wears no clothing until she becomes a wife living with her husband, when a rough skirt of calf's skin serves as a petticoat in the remote districts, while those in the neighborhood of the colonial stores turn out in the same style of dress made of cheap cotton goods. The women are forbidden to touch a cow, consequently the operation of milking is performed by the men, which is about all the labor they do.

In one of my trips into the Zulu country I had crossed the Natal boundary but a short distance, when I encountered a novel idea in the shape of baskets, which held liquids. They were woven from a species of rush, and when not in use, were placed in running streams, so as to keep the material from which they were made well swollen. Some of them were quite large and used for the purpose of brewing a native beer from Kaffir corn, which I imagined was a variety of sor-

ghum, from its close resemblance to that plant. The beer was strongly intoxicating, and I frequently met parties of natives under its influence.

A Zulu is proud, warlike, superstitious and indolent, but when one once gains their confidence, he can certainly trust to their faithfulness, as was frequently proved by me, during my stay among them. Their warlike qualities have been frequently proved. One of the first instance of this was when the Boers crossed the Drakensberg Mountains and attempted to settle in Natal. They were surprised and slaughtered by the Zulus at a place known as Weenen (Weeping), which I visited. The entire party, some 600 in number, including women and children, were massacred. Since, several desperate wars have taken place between them and the English colonists, in the last of which the Prince Napoleon, only son of Louis Napoleon, was killed in a surprise. In Natal no Zulu is allowed to have a gun, and they are all armed with their native weapons, namely the knob-kerrie, or club, and assegai, or spear. The knob-kerrie is usually made of heavy wood, and occasionally of the horn of the white rhinoceros, a species that is fast becoming, if it is not already, extinct. I have one in my possession which was obtained in exchange for tobacco, that I prize very highly, as I doubt if there is a duplicate of it in this country. I have seen a Zulu boy throw a small wooden one whirling and cut down a quail in full flight. The assegai is a rather light spear, which is thrown with surprising force and accuracy. Several times did I see one hurled and transfix a grinning Vervet monkey over fifty feet distant. From my experience with them I would say that the Zulus are vainglorious, superstitious and indolent; but if one gains their confidence, they are wonderfully honest and faithful. On my departure from Natal, my body servant, January, wished to accompany me, but as there was a colonial law forcing every one who carried a Zulu to foreign parts to give security for a safe return, I was compelled to leave him behind.

FRANK J. THOMPSON.

## It Just Happened So.

### II.—That the Gull was There.

AN interesting illustration of the excellent marksmanship of Uncle Sam's men behind the guns, as developed during the recent inspection trip of the naval committeemen on the United States ship Dolphin, has just come to light. Representative Roberts, of Massachusetts, was of the party. Approaching Gunner's Mate Spoer, of the ship, Mr. Roberts offered him \$1 to hit a seagull. Spoer took a 40-pound 6-millimeter Colt's automatic gun, and after a trial shot he popped a seagull on the fly at 400 yards. One of the Representatives was firm in his declaration that the shot was an accidental one, whereupon Spoer shot another gull at 350 yds. The crowd of astonished witnesses to the feat finally came to the conclusion that Spoer was the crack shot of the ship. This Spoer modestly disclaimed, saying, "We've a shipload of 'em, sir." Spoer got his dollar.—Washington Star.

### III.—That the Shark was There.

E. Baero, master of the bark Margharita, has answered the petition of damages filed by Juan Martinez.

In his petition for damages Martinez said that he sailed from Pisagua, Chili, July 21, on the bark Margharita, bound for Savannah. During a storm, while the bark was some miles off the coast of the Falkland Islands, he was ordered aloft to reef a sail. When he reached the yard arm and started to perform the hazardous job the yard arm gave way, and he was plunged into the sea. As he sank a shark or some other sea monster bit one of his legs off. He was rescued from the water almost dead from loss of blood and the severe shock to his nervous system.

Martinez claims that his fall into the sea was in the discharge of his duty, and was caused by the insecure manner in which the yard arm was fastened, which was the fault of the ship owners.

It is in the narrative of Martinez that the real horror of such an ordeal as he went through is truly depicted. He can scarcely speak English, but in his description one not at all familiar with the Spanish language can supply with imagination what some of his excited sentences mean. Martinez hobbles about on his crutch. "I never want to go to sea in a sailing vessel again," he said. "I shall never forget that night," and then he related the story:

"We were sailing off the coast of the Falkland Islands somewhere, when a heavy gale struck us," he said. "I was ordered to go aloft and reef a sail. The masts were whipping about like reeds, and it was all that I could do to keep from being snapped into the water. When I reached the yard arm and prepared to reef the flapping sail, I felt something give way, and down I went. I seemed to have fallen a mile before I struck the water. As I felt the sea close above me, and I went down and down into the waters, which were even darker than the night itself, I gave up all hope of life.

"As I was rising to the surface again, I felt a powerful pressure on my leg. Quick as a flash I drew my knees up to me, putting one against the head of the monster in an endeavor to break his hold. This seemed to infuriate him, and he commenced shaking me as a bull-terrier would a rat. I had no instrument that would be effective against such a powerful monster, but in sheer desperation I pulled out a small pocket-knife that I had and made an effort to strike with it. I was strangling, and my strength was fast leaving me. I began to lose consciousness, and I could feel the bone in my leg being crushed. I felt something give way as I neared the surface, but never had an idea that my leg was gone. As I rose to the top, I saw a light up above, and I knew that I was at the side of the bark. I called as loudly as I could, and was finally hauled aboard, where I lost consciousness. When I came to, my leg was missing, and they told me that I was in that condition when they fished me out of the water."—Savannah (Ga.) News.

## Natural History.

### Kadiak Grizzlies Again.

For the benefit of anyone who may possibly want to go to Kadiak Island for the giant bears that have made the island famous, let me say that the simplest way to get there is to take a cannery steamer from San Francisco to Karluk Beach, on the Shellikoff, or west shore of Kadiak Island. From there take another cannery steamer to the cannery at Uyak Bay. Be sure to finish out your outfit here, for beyond Uyak Bay there are neither stores, roads, horses, conveyances, or even human beings, and the only houses to be met with, if they can be called houses, are two deserted barabaras of the natives, one at the end of the trail to Karluk River, and the other at the foot of Karluk Lake. From the cannery at Uyak Bay you go in open boat to the head of the bay, and from there is a portage over a pretty blind trail to the barabara just alluded to on Karluk River. From this point you follow up the river to its source at Karluk Lake, and I venture to say that you will not be there long, if it is the right season, before you make the acquaintance of some of the giant Kadiak grizzlies, and when you see them I think you will admit that they are the largest grizzlies you ever saw.

The "carry" or portage from the bay to the river is covered in some places waist deep with toondra or Siberian moss, usually water-soaked, and there are miry spots on the trail almost knee deep, so you must take your high rubber boots along, and of course you must have guides and baidarkas besides your regular white man's outfit. Be sure to take plenty of blankets along, too, for one morning in the middle of August we found ice half an inch thick in our coffee pot that had stood outside of the tent over night.

Once at Karluk Lake, all you have to do to find your bears is to sit in your baidarka with your rifles and let your Aleut guides paddle you quietly around the shores of the lake. If it is in August and your experience is like ours, you will not only soon see grizzlies, but you will have an opportunity to shoot at them in perfect safety from your boat, or if you prefer the excitement of a land encounter you can take a grizzly trail and follow it up on land; but I may remark here, that if it is ever true that "discretion is the better part of valor," it is when one is on the trail of a Kadiak "big bear." I will only add that if any one goes to hunt these bears at Karluk Lake, he should go in August when the salmon are spawning in the shallow water along the shores of the lake, for that is the time when the bears congregate about the lake. At other seasons of the years they are probably scattered indiscriminately over the island, and it is only a matter of chance whether you see one on the lake or anywhere else.

I have called these bears "grizzlies" because they are commonly known by that name, but I am aware that some naturalists distinguish them from *Ursus horribilis*, though as far as I can see they look as much like the regulation grizzly as two peas look alike, except that the Kadiak variety is on a bigger scale than the ordinary grizzly.

LIVINGSTON STONE.

### Do Bears Destroy Game?

Editor Forest and Stream:

Sooner or later, in the discussion on bear protection now going on in your columns, the question was bound to come: "Do bears play any appreciable part in the destruction of our large game?" The casual reader will answer, "Of course they do." Then the question follows, "Is that the result of general hearsay, or of fairly reliable observation?"

In your last issue, one of your correspondents, who undoubtedly knows well his own ground, calls down the law on Bruin on account of his game-killing proclivities, maintaining that he is responsible for large numbers of moose, caribou and deer that disappear annually. Two or three interesting incidents of Bruin's carrying away deer are mentioned; but in each case the supposition seems to be that the bear appropriated game which had already been shot, rather than that which he had himself hunted and killed. Undoubtedly your correspondent has other cases in mind which the writer and many other naturalists would be glad to hear. So, in the interests of Bruin and of natural history, this article is written, in the hope that some of your readers may be enough interested in the subject to send their own observations.

It is generally held, I think, in more or less definite fashion among hunters, that Bruin is a game-killer; but it is astonishing how hard it is to find first-hand evidence on the subject. Whether this be, as your correspondent suggests, because Bruin is a sly dog and conceals his depredations, or because he is really innocent of the charge, is an open question. Personally, I have known one or two cases where bears have undoubtedly killed fawns and calves, but in no case am I at all certain whether this were an accidental affair, a bit of Bruin's good luck, or the result of deliberate hunting. I have found where bears have pounced upon wounded or helpless animals and by killing them have saved the poor brutes from a slower death. No credit to the bear, of course, but it might influence our point of view and call down the law on the hunter. And I have known of cases where a hunter, returning for his game, found it missing, and Bruin was the ultimate winner. But I have not yet found a genuine case of a bear stalking a free deer, a moose or caribou, and getting his game. Once, possibly, I came near it, in surprising a big black bear that was lying in wait in some bushes at a narrow opening between two barrens. A herd of caribou were going that way, to pass from one barren to the other, and it is possible that Bruin was watching there to catch one.

The difficulty in the case seems to be that a bear's odor is so strong that a man—to say nothing of the sensitive nose of a deer—can often detect him even when he is lying to leeward. The strong, doggy smell

is a warning that even fawns must notice, and so the game can readily look after itself. Pigs and sheep are easily caught, but a deer is a different proposition; and so it may be that Bruin is no game killer for the simple reason that he cannot be, even with the most earnest intentions.

In the brief season when fawns are left hidden in the woods, while the mother feeds, the bear might easily destroy the little fellows, and probably does, if he chances to stumble upon them. At such times, however, fawns are cunningly hidden (and probably have something of the game bird's power of withholding scent); and I judge besides that Bruin is little of a hunter, contenting himself with simply taking the good things that come his way—with an occasional *ausflug* after sheep or shots that he can get without trouble.

At most times of the year Bruin is well fed, thanks to his inclusive appetite and to nature's abundance. Indeed, he seems to make little effort for his food, except to ramble about perpetually. If he finds dead meat, he eats it; but, judging from my own observations, he will go further and take more trouble to get fish than flesh; and at all times he prefers honey and mast and berries and grubs to either. In the summer and autumn he seems to be almost entirely herbivorous. In the winter, when deer are in their yards and more at the mercy of their enemies, Bruin is safely tucked away where hunger does not bother him. In the spring, when he comes out after his long fast, he seems to avoid meat in the first few days; but in the absence of other food, will turn to whatever dead animals he can find. It may be at this season that he occasionally kills some of the animals that have been weakened by the long winter. All these are, of course, mere indications, which prove nothing conclusively, but which may, however, point to the fact that big game suffers very little from this prowler in the black coat.

In the Yellowstone Park, where one of the chief objects is to protect the game, bears are not molested. Mountain lions and wolves are shot at all seasons; but Bruin and old Ephraim go their peaceful ways and are protected like the elk and bison. Mr. C. J. Jones ("Buffalo" Jones), game warden of the Park, says positively that bears are not molested there simply because

they do no harm to the game. In forty years of his life among animals, he tells me, he has known hardly a single case of game being destroyed by bears of any kind.

Certainly in the Park, where game is so abundant, he has splendid opportunity to settle the question. Yet one man's experience counts for just for one man's experience and no more, in settling any question of animal habits. Moreover, brutes of the same species differ widely from one another even in the same locality. It may possibly be that the so-called ranger bear, which appears occasionally and which hibernates only a small fraction of the winter, during the heaviest storms, is simply a larger bear which, contrary to the habit of its species, has taken to killing game and so does not need to den up, as his fellows do, when the heavy snows come.

In speaking recently with another hunter from the same locality, who is a well-known guide for the Rockies, he said decidedly that bears do destroy game; and he mentioned the well-known fact that in the spring grizzlies are often caught feeding from the carcasses of winter-killed elk. But when I questioned him closely he said frankly that he had himself never seen a specific case, nor did he know of one, where he was fairly sure that the bear had caught and killed his game.

So there is the question with which we started. Will not the hunters of FOREST AND STREAM give us their own observations and experience, and so help to settle a problem in natural history which has interested the writer, and no doubt other readers, for many years past? Incidentally it may help to settle the primary question whether or not Bruin should be protected in regions where the farmers' sheep and pigs do not turn the balance against him.

Wm. J. Long.  
STAMFORD, Conn., March 11.

E. J. Chase, of Newcomb, N. Y., writes in the Essex County Republican:

"Since the opening of the bear protecting campaign I have read with much interest the various articles of discussion on the subject in the papers, and am pleased to see such strong argument drawn out against the

protective measure, but am surprised that some of the stronger points have been omitted, points which should have much weight in our State Legislature.

"It is an undisputed fact that bears cause great havoc in the sheep pasture, and also take pigs, calves, colts, etc. I wish to say right here that the strongest point of the whole argument is the fact that bears commit even greater depredations on our noble game animals, the deer, moose and elk.

"It is well understood by persons having any knowledge of the nature of deer that the mother leaves her fawns in hiding each day or night and proceeds to some distant pond or stream for feeding, and while the fawns are thus left they offer no resistance to the hungry bear, who very easily locates them by the use of his very sensitive nasal organ, and a young deer makes a very desirable repast for him.

"It has been my experience to discover where several fawns had been thus caught and devoured by Bruin, whose tracks were in evidence to prove no mistake, and surely if several cases of this kind have come within the limited scope of my experience, there must be a great number throughout the vast Adirondack wilderness.

"The above conditions are fully applicable to the moose and elk, whose natures are identical with that of the deer.

"The State is expending a large sum of money to restock the Adirondacks with these noble game animals, and surely our legislators will not enact laws that will be antagonistic to the interest sought.

"The ravages of bears are unlimited; they do not hesitate to enter any stream in quest of fish, and will literally clean them out during the spawning season.

"They are equally as destructive to our game birds, and are particularly fond of taking an old partridge from her nest and at the same time secure the eggs or young birds.

"I am at a loss to conceive any possible excuse for any person who may wish to pass a law to protect black bears, unless it may be to gain notoriety in some way; certainly it is not for the purpose of enhancing the best interests of the Adirondacks."

## Alaska Indians and the Game Law.

Editor Forest and Stream:

Since so much has been printed of late regarding the abundance of game in Alaska, and the privations endured by the natives in consequence of the so-called "absurd piece of legislature," known as the Alaskan game law, I deem it my duty to state the facts regarding the Indians and the game, as I found them during a visit to the Cook Inlet country in 1901.

The enemies to the Alaskan game law assert that there are yet large quantities of moose, caribou, deer, sheep, goats and bear in Alaska. This I do not think will be contradicted by any sportsman who has traveled in the country. It is not so much a question of whether the game is there, as it is how long it will remain, under existing circumstances. The buffalo once roamed our western plains in such vast numbers that people said it was impossible to exterminate them, yet in less than ten years they were wiped from the face of the earth, and that before the time of smokeless powder and expansion bullets. Are we to wait until history again repeats itself before we come to our senses?

Speaking in a general way, game is still plentiful in Alaska, but the stories that one hears about the wanton destruction, and about its abundance fifty years ago, proves beyond a doubt that it is rapidly being exterminated. This is particularly true about the populated districts where it has become necessary for those dependent on the game for their food to travel further away before they are satisfied. Still fish are usually plentiful where other game is scarce.

Is it any reason why game should not be protected because it is still found common? We are told that the animals are so abundant that it is nonsense to protect them. Can anyone point to a country that has been civilized or is undergoing civilization, where the game is as abundant now as it was before firearms were introduced? In every case the most stringent laws are necessary, and we have only to look at our West and to Africa, to convince us that there the protection to the animal life came too late. Is it necessary to flaunt in the face of Congress and the people, such chestnuts as the passenger pigeon, great auk, Labrador duck, American bison, and Steller's scow; and many other animals that have fallen under the advance of civilization; to prove to them that animals are exterminated regardless of their abundance.

If the Alaskan game is to be saved, the time to act is before it is too late, and that time has now arrived.

For the benefit of those who think that the natives never kill game without a cause, and do not waste the meat, I will say:

During my trip up the Knik River, I came near getting into serious trouble with my three Indians, because I would not allow them to kill everything they

saw, from an eagle to a moose. They claimed that they could not live on my larder of rice, beans, flour, coffee, milk and bacon, but must have fresh meat; and they wanted to kill meat to take back to their hungry parents.

As we were leaving the country we came suddenly upon two yearling moose, I killed one and the Indians shot the other. No sooner had the animals fallen, than my guide informed me that the Indians objected to packing the meat (piece by piece) a quarter of a mile over the level (but marshy) country to our boat. And these were the Indians who for weeks begged me to allow them to kill meat for their hungry families.

A few days later a large bull moose was seen near camp. Although we had all the meat we could possibly carry, the Indians wanted to go after it. That same afternoon a second moose forded the Knik River near us, and again the Indians would have killed it had I not interfered.

One of the Indians admitted that he and a companion had shot five moose the winter before, and had saved the meat of but one. When asked why he did not take the others, he replied that they "were bulls, and tough."

During the spring of 1889, an Indian killed fifty moose back of Tyonek, where they were once common, but have since almost entirely disappeared. The North American Company's agent at Knik gave the Indians an order for twenty-four head skins from bull moose. One windy day the entire order was filled, and little of the meat from the noble animals was saved.

My guide, Mr. H. H. Hicks, whom I found to be perfectly reliable and who has lived in the country for six years, trading and hunting with the Indians, told me that they were wanton destroyers of game. Mr. J. L. Davis, of Kadiak, informed me that the Indians on Afognak Island, and the adjoining mainland, were killing bears during a season when their skins were worthless, simply saving the intestines, which are used to make waterproof garments.

Game law or no game law, the Cook Inlet Indians, at least, will have the same hardship-starvation story to tell every winter. It is the perpetual winter cry of the entire northland, and this is a country where fish, and both large and small game can be secured by little exertion.

At the time that I visited Alaska, there was no game law, still I heard hunger stories from the time that I landed at Tyonek until I left the country. While none of the natives were in an actual state of starvation, they claimed to be in want of food, and were constantly begging. Yet, whenever I took a trip into the timber, I found snowshoe rabbits and spruce grouse common within three miles of the village. At Knik, some eighty miles northward, I heard the same stories; yet back of this place is where one of my Indians killed five

moose, four months before, and saved the meat of but one. Moose were fairly common fifteen miles from the village and there was then no law to prevent them being killed, yet the inhabitants were too lazy to go for them. Here, also, I saw the dogs patrolling the beach and mud flats at low tide, catching the fish that had become stranded in the pools, while their owners lay about camp and begged credit of the traders.

Of course, it is harder to hunt in winter than in summer or in fall, but there is really no need of an Indian stirring from his cabin during the winter, unless it be to get water and fire wood. If he so chose, during the summer and fall he could lay by enough dried berries, fish and moose, caribou, deer, sheep and goat meat to feed his entire family, regardless of its size, for a year; yes, years.

I will leave it to any fair-minded person, if there is an excuse for anyone going hungry in a country where berries are abundant in summer, and where from the first of July until the middle of September, the salmon run up the streams in such numbers, that the fishermen are often obliged to allow part of their catch to escape before they can haul their seine ashore. Even the bears glut themselves to such an extent that they choose what to them are the choicest parts, eating only the head and belly. Candle fish (small fish, so fat, that when dried they will burn) are so abundant, that I have walked along the beach and picked up dozens as they were washed ashore by the waves. My guide told me that he knew of places where, at certain times, he could scoop up half a bucket full at a time.

At Skagway I saw both Indians and whites paddling about the bay over schools of fish (herring, I think they were), capturing them by means of long poles, having nails driven into the end at intervals of two inches or more. One of these poles was thrust into the water by a man seated in the bow of the boat, and by a sweeping motion it was drawn through the schools, which were so compact, that each time from one to eight fish were impaled on the spines and flipped into the boat. I saw bushels of fish captured in this way; the water was black with them, and when the steamers drew up to the dock the fish scarcely moved out of their path.

Lack of foresight and lack of energy, are usually responsible for the hardships endured by Indians. An Indian does not hunt because he likes it, it is labor to him, his way of earning his living, and so long as there is meat in camp, so long will he postpone his labor. Even after he has consumed his last mouthful, he frequently does not attempt to replenish his larder until the pangs of hunger demand it. Then he starts out and his family fast until he returns; if perchance he is unsuccessful for a few days, or if he is further delayed by accident or storms, as is frequently the case, the period of hardship for those dependent on him is

prolonged. Once he is among the game he does not hesitate to slaughter everything that he can, then he returns home with the choicest parts and feasts, until again compelled to hunt.

As summer draws near, you will hear him say, "Wait until the salmon come; I am not going to be hungry again next winter, I am going to dry enough fish to keep myself and family in meat until the next spring." Poor fellow: he means it all right, but when the salmon come and he has had his fill, he becomes lazy, forgets hunger, and next winter brings its same story of starvation.

The stories of lack of food are seldom heard from the missions, where the influence of the missionaries is felt, but from the Indians beyond their reach. "The mission Indians," as a rule, are industrious. They freight goods for the whites, fish for, or work at the canneries, and lay by a winter's supply of dried fish or meat for themselves.

So I say that if the Alaskan natives living along the Pacific (and within a belt 100 miles from the coast), between the town of Wrangel and the head of Cook Inlet, will begin to dry fish and berries as soon as the season opens, and in the fall dry the meat of the large game animals, which the laws allows each man to kill, they will have food in plenty all winter; and it will not take a man and his wife more than two weeks to do it either. Then, if they will put in part of their spare time trapping furs, making "eucla" (dried fish for dog food, which is purchased and shipped north by the commercial companies), or fish for, or work at the canneries, the income will easily supply them with clothing, groceries and other necessities.

Formerly, the large game animals were so plentiful that they could be killed from cabin doors. Now, however, the Indians are obliged to travel from ten to fifty miles before they find it in quantities. This, of course, entails more labor to get the meat back to camp, and the Indians are loth to follow the hunt in consequence, preferring to lay about camp and complain that the game has all been killed out.

It is the wanton, reckless slaughter that is exterminating the animals; killing simply for heads, skins, intestines, and killing for the pleasure of killing, which trait seems to be born in the northern Indian. The amount of game shot and actually consumed is a minimum in comparison to the amount that is slaughtered.

I am in favor of a game law which will allow the Indians to kill all the meat they need, between the months of September and January, provided they will agree not to kill wantonly. I sincerely believe that (with the exception of bears on Kadiak Island) in the localities where most of the killing would be done, the number of animals taken would not outnumber the yearly increase.

The question naturally arises, how are we to enforce game laws; how can we show the Indians their errors? A single issue of FOREST AND STREAM is too small to answer this question.

Much good could be done by appointing or sending agents to the larger Indian villages to explain the game law. Instead of threatening them, they should be reasoned with. Tell them the stories of the passenger pigeon and the buffalo; how at one time the birds were so abundant, that limbs of trees broke under their weight, and the sky was darkened with their flight; tell about the buffalo migrations and the sight that met the eyes of Col. Dodge when he went west. Compare the pigeon flights and the herds of buffalo with the schools of herring and the salmon runs, and then explain to them how quickly they were all exterminated. At last, wind up with an explanation that the Alaskan game law is not intended to cause them hardship, but to prevent the extermination of the game in the same manner that the pigeons and buffalo have gone, and that the Government wants both the white man and the Indian to cease killing, for the sake of killing and to assist it in keeping the game law, and in this way preserve the game for their children and grandchildren.

Pictures of the buffalo and pigeon migrations distributed to a few families in each town would help to keep the stories in their mind, and herald them to outlying districts by visiting natives. This, it seems to me, is one way by which much good could be done in preserving the big game.

It has not been my object to prove that the Indians are the only slaughterers of game in Alaska; the whites are equally as bad. I could enumerate many instances where the killing of moose at Turnagain Arm, and deer about Wrangel Narrows, is positively shocking. I have confined my remarks to the Indian question, because, as has been said, attempts are being made to prove that it is the game law that is causing the suffering, and that the natives never kill more game than they use.

J. ALDEN LORING.

OWEGO, N. Y., March 17.

P. S.—Since writing the above, I have read Mr. Gouverneur Morris Phelps' letters in last week's issue of FOREST AND STREAM. My observation regarding the abundance, distribution and destruction of the Sitka deer, on the islands and southern coast of Alaska, agrees perfectly with his statement.—J. A. L.

### A Good Shot.

A FRIEND bought a fine hammerless ejector gun last summer, and not having any time to use it, loaned it to a friend of his to go after ducks. When the gun was returned the gentleman said: "Say, Mr. L., your new gun is no good for wild ducks, but for tame ones it's a corker! I got four shots into a flock of tame decoys and got ten; and at \$5 per, they were too rich for me. If they had been wild ducks I would have got possibly two or three at the most."

E. H. K.

The talk of scarcity of game and fur in this locality may seem to be a myth after reading the statement of Edward Minerly, one of our local hunters. He says: "I have caught 65 skunks, 300 muskrats, 5 minks 40 opossums, 5 foxes, 2 greys, 1 red, 40 raccoons, 1 bear and 3 wildcats, at Plattekill, and about 300 rabbits.—New Paltz (N. Y.) Independent,

## Harking Back.

OUT of the dim past comes a letter from an old playmate, who, although out of sight for forty years, yet rarely out of mind. He was older than I, and from him I learned to know the haunts of the woodcock, snipe and quail.

We carried our muzzleloaders, shot pouches, flasks and caps afield many an early Saturday morning. He owned old Dick, and of course on such trips Dick led the way and pointed the quarry. Dick was a pointer, and yet was he marked and spotted like a carriage dog. Good of nose, staunch, invaluable at retrieving and obedient, he was responsible for many a full bag and pleasant day in the swamp, marsh and stubble. Many were the birds we had brought to our hands that we doubted if we hit. But while we shot where we thought the woodcock was a-going through the thick alders, yet Dick knew and fetched.

And that day up in Connecticut with old Pa Hinman when we missed Dick for fully half an hour, only to see him bounding over stones and crawling under fences toward us with a fine cock partridge that had carried away the contents of two barrels, Dick knew and found our bird.

And Rob writes, "Well might you say, 'turn back the hands of time forty years and make us boys again!'" He goes on and says J. P. and myself are alone left of the M. crowd of gunners, and he is almost blind.

"The rest have all gone to the happy hunting grounds. Joe L. died last month. Charlie, you would not now know the old stamping grounds we knew so well as boys, and over every foot of which we tramped with guns on our shoulders. They are cut up and built upon, and bricks and mortar loom up where the snipe arose and went off with a scape! scape!

"I have done no gunning for years, and the old gun is laid away to rest. Not that I can't shoot even now as well as I ever could and can see as well and could no doubt make some of the younger fellows take notice, and can walk as far as I ever could, but the old haunts are gone, and the ones we loved to go with have gone with them.

"I can picture your boy and the prairie chicken just as if I were with him. What a day it must have been for him! We were there once, you and I, ourselves, and we know."

And you put down the letter and find yourself wandering through the woods among the old familiar scenes; now crouching under cover awaiting the evening coming of the woodcock at the old Mile Pond; now perspiring at every pore as you slashed through the hip-deep black muck and tore your way through the branches and alders of Moriches Swamp; now basking in the sun behind your scanty blind on old Rockaway Beach, as you whistled and lured the snipe to your decoys; again at old Huntington, where we hunted woodcock in July and quail in October, and not the least forgotten at old Riverside, where in the Connecticut swales and along the sunny sidehills we followed the plump woodcock as they dodged betwixt and between the white birches, or stopped the lordly partridge as he broke from 'neath the protecting hemlock and went thundering on his course that ended in a fluttering thud upon the ground surrounded with a glory of fluttering feathers.

Yes, Bob, I remember the old days, and if there are any hunting grounds across the river that we must all cross some day, we'll be boys once more and live our happiest days over again.

CHARLES CRISTADORO.

## Spring Duck Shooting.

SYRACUSE, N. Y., March 16.—*Editor Forest and Stream:* In your issue of March 12 there appeared an article by Madison Grant, secretary, wanting to know who W. E. Hookway, secretary, represents. I have the honor to represent 90 per cent. of the duck shooters of central New York. I mean shooters, and men who own a shotgun and go hunting. They are not fishermen or persons who never go hunting, or those who have a theory "what a duck law should be for the other fellow."

We have an organization for the preservation and protection of ducks, and our aim is to get a law fair to all, rich and poor alike. The present law is too one-sided, and it is sure to be appealed or amended, as one-sided legislation will never stand.

Now is the time to get a satisfactory law.

We admit that more ducks would be preserved if none were shot, but fail to see why ducks should be preserved for the wealthy.

If too many ducks are shot, then cut the shooting days down to twenty days a year if necessary; but have ten days' shooting on southern flight and ten on northern, and also limit the number of ducks to be killed by each shooter.

With a limit of ducks killed in one day, no man will pay \$3,000 for a share in shooting preserves, as they do at the present time.

Why should the wealthy shooter be allowed to kill from seventy-five to a hundred and fifty ducks a day in the fall of the year on their preserves, and a poor farmer be prevented from killing ten in all the spring shooting he does on his wet back lot?

The men I represent claim it is no more harm to kill a duck in March than in November, as long as the duck is not paired or mated.

We favor cutting down the shooting days, and having them Wednesday, Thursday and Saturday of each week from Sept. 15 to April 15, which will give in central New York sixty-two days a year, against a hundred and seven, present law, not counting January and February, on account of weather conditions. There cannot be as many ducks killed in sixty-two days as in a hundred and seven.

Around Syracuse the best points and ponds have been bought or leased, and there is no place for a poor man to go in the fall. The best points and ponds at Montezuma marshes have all been bought up lately. The two islands in Cross Lake are now owned by two men, and the other good places have now been closed to the unfortunate.

On the northern flight any one can get a place, as our swamp woods, which are dry in fall, contain from three to four feet of water, and the poor farmer who owns the land can go down into his woods and get an outing without hearing what he does in the fall, "Get out of here; this is my pond."

We ask that a fair and impartial law be passed, one that will preserve ducks, and one that will treat every one alike.

Let the wealthy have their preserves, but cut down the shooting days and give the poor man a chance.

In central New York the southern flight of black ducks does not amount to much because we have no water. We have thousands in the spring on account of the high water, and those few who breed here are killed off in August by lawless shooters; and if a few ducks which do nest here could be sent on north it would be better for the duck, as she and her young ones would not be killed off in August by a pot shot.

We would be thankful to FOREST AND STREAM for any suggestion as to a law that would be fair to all; but we feel grieved to see a man go to his preserve in the fall and kill more ducks in one week than all the shooters combined in Onondaga county kill in the entire spring shooting.

If the present law is fair, we fail to see it; and we do not feel that we who want a few days on northern flight are the only game butchers.

We are organizing, and expect to have shooters in every Assembly District, and we now ask the FOREST AND STREAM to consider all the facts and conditions, and suggest a law fair to all. And also would like to have a suggestion from any interested duck shooter.

We also suggest a law being passed preventing the carrying of guns of all kinds during the months of May, June, July and August in woods, on lakes, streams, etc., as there is no way now to prevent lawless shooting.

W. E. HOOKWAY.

## Game Cold Storage.

NEW YORK, March 19.—*Editor Forest and Stream:* The purport as stated in your issue of March 12, of the bill introduced by Mr. Prentice, to amend Section 141 of the Game Law, would seem to be inadequate. The object of the Prentice bill is to prevent the storage of game during the close season.

In March, 1902, an amendment to Section 141 was introduced in the Legislature permitting proprietors of cold storage warehouses upon giving a bond for \$1,000, to keep game in cold storage during the close season. This bill was passed through the Legislature at a highly accelerated pace, in fact its speed was so swift that no public hearing was given on the bill nor did the public even have opportunity to remonstrate. The New York Association for the Protection of Game heard of the introduction of the bill, and passed a resolution directed to be sent to the Governor and all the members of the Legislature, protesting against its passage, but before this resolution could be printed and sent to the Legislature the bill was passed and signed by the Governor. It was vicious legislation, in the interest of a few owners of cold storage warehouses, and diametrically opposed to the people of this State, and this I fancy will explain the manner of the passage of the amendment of 1902.

The Prentice bill merely seeks to strike game from the provisions of the section as it now stands and so prevent the storage of game during the close season. I believe if the public, and sportsmen generally, knew of the introduction of this bill they would clamor for its passage.

XPER.

NEW YORK, March 1904.—At a regular monthly meeting of the New York Association for the Protection of Game, held at the City of New York on the 14th day of March, 1904, the following resolution was adopted:

"Resolved, That the New York Association for the Protection of Game favors the passage of Assembly Bill No. 1040 amending Section 141 of the Game Law, by striking out game from the provisions of the Section, and that this resolution be printed, and a copy be sent to Mr. Prentice and the Chairman of the Committee on Fish and Game in the Senate and the Assembly, and the remainder distributed by the Special Committee on Legislation."

ROBERT B. LAWRENCE, Secretary.

## The Adirondack Bears.

*Editor Forest and Stream:*

The talk about our Adirondack bears gets on to the edge of one's nerves. The story of Mr. Hardy, in the issue of March 12 is particularly suggestive, even though he is from or in Maine. He has bought, say, 5,000 bear skins of which he thinks fifty were shot to death in a fair way. The others were trapped. No one need doubt this statement. The people of the Adirondacks know that "very few bears are ever shot by fair shooting." The man who has "killed his bear" usually has to acknowledge that he got it by unfair shooting. Now, what I want to know is this: What kind of a man is it, let alone asking what kind of a sportsman is it, that will go out and set a trap for any kind of game? The one blot on the reputation of the men who come to the Adirondacks that is deeper than any other blot is their trapping of the bear. To set a trap is to acknowledge that the trapper hasn't the brains of a bear; he can't get a bear by fair shooting; he is unable to do it even with the aid of dogs.

This is not an appeal in behalf of bears, but in behalf of manhood. The woods makes men, if the bipeds who come to the woods will but show some inclination manward. But the weaklings who come here to get the name of killing a bear (to get the name, mind you, not the requisite skill to kill one), these poor curs haven't backbone to stand upright, let alone leaning manward. The fact that but fifty out of Mr. Hardy's 5,000 bears were killed by fair shooting shows that the bear is the game best worth a man's time of any in the woods. I do not mean to argue in favor of a close season, but I do say that the extermination of the bear would be the greatest—at least one of the greatest—evils that could befall the Adirondacks.

The letter of George L. Brown, editor and manager

of the Post and Gazette, makes an appeal that is particularly fetching. If he will let me know at what particular time of the year he and his neighbors are "run over by bears" I'll certainly visit the place and photograph the stampede for the benefit of readers of FOREST AND STREAM and the law-makers of New York. I agree with his consensus of opinion that "Bruin is a beast of prey," and that he should be "shot on sight." But what I have been trying to learn these many years is how to get the sight without the use of a trap. If bears are so numerous there as to add to the burden and heat of the day—well, the only burden and heat that afflicts us on this side of the mountains in connection with bears is due entirely to our inability to get sight of the wily beast.

One other point of the letter of the editor and manager of Post and Gazette is notable. He says "our sheep, pigs, cattle and horses, our crops and fruit trees" have been "totally destroyed" by Bruin. That is a most interesting statement. I beg that he will amplify—just how many of each have been so destroyed in that county during the last year, or, say during the last time the bears "run over" the county. I have lived on the edge of the great wilderness for sixteen years, and in that time not one domestic animal has been destroyed by a bear anywhere in my section. A bear came to the house directly across the road from mine one morning early, and it smelled of the chicken coop, but went to the swill barrel a moment later, leaving the chickens unhurt. My neighbor's wife got up to build the fire about that time (good woman, that—she built the fire), and when she went out to get some wood she met the bear. But the bear didn't run over her—not a step. He hiked it for the woods. Neither swill nor chickens could tempt him to remain in the presence of a lady uninvited. The bear, as said, is of all game in the nation the most difficult to get by fair hunting. For this reason and for this alone, I hope they will long remain with us, even though they do run over some of the Essex county editors and managers and add to the heat and burden of the day. It is a good thing to have them here if only to attract to our region now and then one whom all the gods declare to be a hunter sportsman—one who can kill his bear by "fair shooting." And meantime, some others among us are doing as well as we can to acquire the skill of these rare great ones, and we don't want to lose our incentive.

JOHN R. SPEARS.

NORTHWOOD, N. Y., March 18.

From the Elizabethtown Post, March 10:

When Senator Townsend's bill relating to the protection of wild black bears in the State of New York was reached in the Senate Monday night, Senator Townsend offered an amendment to except Essex county from the provisions of the bill.

Speaking of the Essex county exception in the Albany Argus of Tuesday, March 8, 1904, Smith, the editorial writer whose fun-making is proverbial in and about the Capitol, said:

"Senator Townsend's bill, to protect the black bears of the State and give them a close season wherein to be as reasonably safe from the out-of-season hunters of the Adirondack region as the deer and other game animals are, has been favorably reported from the Senate Committee on Fish and Game with an amendment exempting Essex county from its provisions. Senator Prime and Assemblyman Graeff were prepared in the event of not being able to exempt the whole county of Essex, to have inserted a provision exempting Editor George L. Brown and the Elizabethtown Post from the operations of the proposed black bear law. Editor Brown has waged continuous war against the proposition to put the black bear among the game animals of the State entitled to protection of law, and he has been successful in getting his county out of the list of those where Bruin may be protected for a period of the year."

The Post and its editor have followed the plain path of duty regarding this bear matter, representing an immediate constituency, and doing what was reasonable in aiding to crystallize public sentiment against a measure which we believed to be not only obnoxious but positively dangerous to the best interests of Essex county as a whole. If our attitude along the line of duty has furnished material for our newspaper friend, fun-maker Smith, of the Argus, and thus added to the enjoyment of the world, we certainly shall take no offense. However, we were merely instruments used toward a much-desired end, and Senator Prime and Assemblyman Graeff are entitled to the credit for the exemption of Essex county when it came to the final "shown down" in the Legislature, and have our sincere thanks for the manly part they have taken in representing their constituency, notwithstanding their personal views on the bear protection matter. Personally, we are satisfied, as the exemption of Essex county is what we have fought for from the start to finish. If the other counties of New York State want bear protection, let them have it.

## Senator Armstrong's Bills.

SENATE CHAMBER, ALBANY, March 15.—*Editor Forest and Stream:* My attention has been called to a letter from Mr. Redmond, of Rochester, in your issue of Feb. 13, criticising some bills which I have introduced relative to dangerous weapons. I inclose you copies of the bills with amendments which I have made to them to meet some objections which were made, and to perfect the measures.

If you will examine Section 409 of the penal code, as it now exists, you will see that the sale or gift of a firearm to any person under the age of eighteen years, or of an air gun or spring gun to any person under the age of twelve years, or of any toy pistol or instrument in or by which loaded or blank cartridges may be used, to any person under the age of sixteen years, is already prohibited. I have endeavored in this bill to not do more than to equalize the age below which such dangerous weapons and instruments shall not be intrusted in irresponsible hands, by making the age uniformly six-

teen years, and at the request of the State Medical Association have included in the prohibition loaded and blank cartridges. I think it will be readily conceded that such dangerous weapons ought not to be put in the hands of irresponsible boys; but in order to do justice to those who hold Mr. Redmond's views, and to limit the application of the existing Section 409, I find it necessary to amend Section 410, so that the prohibition of the possession of these dangerous weapons should only apply to their possession by persons under sixteen in public places.

You will readily see, therefore, that boys may still shoot at marks on their own premises, go afield hunting, and have the utmost freedom in their use, provided they do not carry them in the public streets. This means that boys of that irresponsible age, when they are upon the public streets, must either refrain from carrying these instruments or be in charge of an adult person. The latter part of my amendment to Section 410, from lines 9 to 17 inclusive, is only aimed to regulate the carrying of concealed weapons by persons over the age of sixteen, and certainly does not interfere with the carrying of guns, rifles or other hunting implements.

Now for the purpose of these amendments. It is two-fold. First, I am seeking to protect song birds and animals from the annoyance of irresponsible boys with Flobert rifles and toy guns, than whom our song birds and our pets have no greater enemy. At present, as the law exists, boys by the hundreds in the public streets of cities, villages and towns are carrying these weapons, at an age when they are quite irresponsible, and shooting at every bird or animal which moves whenever it strikes their fancy. They can only be apprehended by being followed and arrested in the act of shooting at a protected bird or animal. If this amendment becomes a law, the possession by them in a public street of such weapons will be sufficient. They cannot be touched in any other place than upon a public street.

In the interest of the song birds and animals, both pets and other kinds, I feel as if I could appeal confidently to your many years of friendship to such legislation to correct the wrong impression which has gone forth that I am seeking to do something either ridiculous or unjust.

The other part of the purpose is as I have suggested, at the request of such men as Doctor Louis C. Ager, Third Avenue and Silliman Place, Brooklyn, President of the New York State Medical Association, to prevent the blank cartridge nuisance among children, and to this end I have made the amendment take effect on June 1, so as to govern the procedure at the next Fourth of July celebration.

Will you not read this carefully; and if you discover that they do more than I have suggested, advise me; and if you find that they do not, support me in the effort which is approved by the Forest, Fish and Game Commission of the State, and by many of my sportsmen friends who hope to see the measures enacted.

WM. W. ARMSTRONG.

The amendments proposed by Senator Armstrong are as follows, new matter underlined, words to be omitted in brackets:

Section 1. Section 409 of the penal code is hereby amended to read as follows: A person who manufactures, or causes to be manufactured, or sells or keeps for sale, or offers, or gives, or disposes to any person of any instrument or weapon of the kind usually known as slungshot, billy, sandclub or metal knuckles, or a person who offers, sells, loans, leases, or gives any gun, revolver, pistol or other firearm or loaded or blank cartridges or ammunition therefor [to any person under the age of eighteen years], or any air gun, spring gun or other instrument or weapon in which the propelling force is a spring or air or [who sells or gives away] any instrument or weapon commonly known as a toy pistol or in or upon which any loaded or blank cartridges are used or may be used, or any loaded or blank cartridges or ammunition therefor [to any person under age of sixteen years is guilty of a misdemeanor.

Section 2. This act shall take effect June 1st, 1904.

Section 1. Section 410 of the penal code is hereby amended to read as follows: A person who attempts to use against another, or who with intent so to use, carries, conceals or possesses any instrument or weapon of the kind commonly known as slungshot, billy, sandclub or metal knuckles, or a dagger, dirk or dangerous knife is guilty of a felony. Any person under the age of sixteen years, who shall have, carry or have in his possession in any public [street, highway or] place [in any city or incorporated village in the State, without a written license from the police magistrate of such city or incorporated village any pistol or other firearm of any kind] any of the articles named or described in the last section which it is forbidden therein to offer, sell, loan, lease or give to him shall be guilty of a misdemeanor. Any person over the age of sixteen years who shall have, carry or have in his possession in any public street, highway or place in any city or incorporated village in this State any instrument or weapon of the kind usually known as slungshot, billy, sandclub, or metal knuckles or a dagger, dirk or dangerous knife, or who, without a written license from a police magistrate in such city or incorporated village, shall have, carry or have in his possession in any such public street, highway or place any pistol, revolver or other concealed firearm of any kind shall be guilty of a misdemeanor. This section shall not apply to the regular and ordinary transportation of firearms as merchandise, nor to sheriffs, policemen or other duly appointed peace officers [or for use without the city or village limits].

Section 2. This act shall take effect June 1st, 1904.

## Legislation at Albany.

ALBANY, March 19.—Governor Odell has signed Assemblyman Reeve's bill (438-477) relative to leases of oyster lands.

Bills amending the forest, fish and game laws have been introduced recently in the Legislature as follows:

Senator Elon R. Brown, providing for additional protection against forest fires, in accordance with the recommendations of the special joint legislative committee which investigated the subject during the summer.

Assemblyman Hooker, defining the powers of boards of supervisors in relation to the protection of fish and game.

Assemblyman Simpson, authorizing the Forest, Fish and Game Commission to sell and dispose of buildings on the abandoned Beaver Kill hatchery, in the town of Rockland, Sullivan county, and authorizing their removal from the hatchery lands.

Senator Carpenter, amending Section 100 so as to provide that this article shall apply only to the counties of Kings, Queens, Nassau, Suffolk and Westchester, and to Long Island Sound.

Assemblyman Cook, adding a new section, to be known as Section 41a, so as to provide that trout shall not be taken from brooks and streams in Erie county for two years from June 1, 1904.

Assemblyman Denison, forbidding the taking of ducks, geese, brant and swan on Black River Bay in the night from sunset to daylight.

Assemblyman Robinson, providing that carp shall not be placed in Conesus and Hemlock lakes, Livingston county.

The Senate has passed the following bills:

Senator Townsend's (12-883), for the protection of wild black bear.

Senate Committee on Forest, Fish and Game, relating to and defining the boundaries of the Adirondack Park.

Senate Committee on Forest, Fish and Game (481-754), providing that no person shall take any wild deer between one-half hour after sunset and one-half hour before sunrise.

Assemblyman J. T. Smith's (293-518), providing that there shall be no open season for deer in Columbia county prior to Sept. 1, 1907.

Senate Forest, Fish and Game Committee, creating the Catskill Park.

The Senate has advanced the following bills to third reading: Senator Townsend's (15-753), requiring non-residents to procure a license before being permitted to hunt wild deer in this State.

Senate Forest, Fish and Game Committee (668-811) relative to the prevention of forest fires.

The Senate Game Committee has reported the following bills: Senator Le Fevre's (326-356), making the close season for grouse, woodcock and quail in Ulster county from Dec. 16 to Oct. 15.

Assemblyman Coutant's (389-979), allowing the use of tip-ups and set lines in Ulster county in fishing through the ice.

Senator Elon R. Brown (473-536), providing that the close season for plover and other birds shall be from Jan. 1 to Sept. 15.

Assemblyman G. H. Whitney's (741-876), providing that perch shall not be taken in Saratoga county from Feb. 1 to May 1.

Assemblyman Harvey's (482-848), providing that the close season for black bass in Seneca Lake shall be from Jan. 1 to Sept. 15.

Senator Ambler's (602-721), providing that the close season for gray squirrels in Dutchess county shall be from Dec. 1 to Oct. 15.

Senator Barnes' (410-699), providing that trout shall not be taken from the streams of Rensselaer county for the purpose of selling the same.

The Assembly has passed the following bills:

Assemblyman C. R. Matthews' (687-807), making the close season for lake trout from Oct. 1 to April 15.

Assemblyman Chanler's (870-1080), providing that suckers may be taken with nets through the ice in Crumellow Creek.

Assemblyman Stevens' (709-1194), making the close season for trout in White Creek in the towns of White Creek and Hoosick, in Rensselaer and Washington counties, from Sept. 1 to April 30.

Assemblyman Nichols' (284-1193), striking out the clause that makes the close season for grouse and woodcock in Ulster county from Dec. 1 to Sept. 30, and in Orange county from Dec. 1 to Oct. 15.

Assemblyman Patton's (611-1243), providing that wild duck may be taken in Erie and Niagara counties from March 1 to Oct. 15.

The Assembly has advanced to third reading the following bills: Assemblyman Cowan's (518-1297), providing that there shall be no open season for Mongolian ring-necked pheasants or English pheasants, except in Suffolk county, before 1910.

Assemblyman Bedell's (951-1183), allowing the use of nets in Wallkill Creek or River in the town of Wallkill from Sept. 1 to May 30.

Assemblyman Wood's (950-1182), giving the game protectors an annual salary of \$600 and \$600 a year for expenses.

Assemblyman Stevens' (982-1220), providing that special game protectors shall have the same power as to the right of search without warrant as regular protectors.

## 100 Sportsmen's Finds.

Some of the Queer Discoveries Made by Those Who Are Looking for Game or Fish.

95

THE story of the discovery of human bones and bangles in the interior of a crocodile captured at Fort Johnson, Rhodesia, brings to mind another story which may appositely be recalled at the present juncture. Everybody has heard of "Mrs. Macquarrie's chair," as they call the eastern point of Farm Cove, in Sydney harbor. There it was that a poor emigrant, in precable days, killed and towed ashore a shark, cut him up, and found a London newspaper in his internals. In the paper was the announcement of the war between France and Germany. The shark had outdistanced the steamer by which the mail was coming, and here the discoverer had the fact to himself. He gave his information to a wealthy wool dealer, who bought all the season's clip at 9d. per pound and sold at 3s. after the news of war had arrived by the ordinary channel. He cleared, it is said, four millions sterling by the deal. The man who killed the shark and extracted the news of price—well, he received a battered silk hat and a five shilling piece, and unrestrained liberty as to the disposal of the shark.—St. James's Gazette.

## Concerning Dogs.

BERRYVILLE, Va.—*Editor Forest and Stream:* The article regarding cats as vegetarians makes me think that I never hear stories of cats, or in fact, anything regarding the intelligence of various animals. I do not want to add a tribute to the dog—any dog.

I once owned a dog which could have been full brother to the one owned by the youngster who described his pet's pedigree as being "half p'inter, other half jest dawg." This dog not only ate vegetables of every description, but was especially fond of fruit. When strawberries, cherries and gooseberries were in season, I would usually find her down in the garden feasting upon the ripened fruit. She it was who found the first strawberries, and after a storm in summer, which shook the ripened cherries and peaches from the trees, she would make a dash for the trees before the children could get there before her. She was also exceedingly fond of nuts, and would hide them away like a squirrel and munch on them as her fancy dictated.

When I returned from a day's sport in the fall, covered with burrs and beggars' needles, she would sit at my feet and carefully pick the burrs from my clothes with her teeth. If beef and other meats continue so high, and the numerous trusts about the country continue to hold a tight rein on "what we shall eat and what we shall drink," why cannot the cat and dog meat be utilized? The principal objection is prejudice, and prejudice must have arisen, because these animals were thought to be carnivorous only. But the FOREST AND STREAM has proved this to be otherwise.

E. A. L.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

## Fishing from Galveston Jetties.

GALVESTON, Tex., March 14.—*Editor Forest and Stream:* Spring is on us, and the born, not made, fisherman is overhauling rods and reels, and trying the waters, although there will be no really good fishing before April, and in fact no mackerel much before May.

From the middle of May to the first of November may be called the Spanish mackerel season of this part of the Gulf. I say mackerel, because all other fishing is secondary to it; and the only drawback to it is that mackerel fishing spoils a fisherman for all other fishing.

There is the same trouble as to our jetty fishing. No salt-water fishing is ever satisfactory to the man who has stood on a flat granite rock six miles out in the Gulf and fished with rod and reel in 30 feet of water.

One of the charms of fishing is the uncertainty of what the day and the water will bring to our bait, and in a cast from the jetty we may draw a shark, a tarpon, a june (or jewfish), pompano (or two of them; they frequently are caught in pairs), a redfish, sheepshead, speckled trout, sea-cat, rockfish (also called the black sea bass on the Atlantic coast), or an angel fish, a pig-fish (sea perch), or last, but not least, the jackfish (a first cousin to the yellow-fin of the Pacific), and occasionally we draw a kingfish; but we are not fishing for any of these; we are after the Spanish mackerel, and are disappointed when the lottery gives any other prize.

I belong to the Tarpon Club—we call it so because we do not fish for tarpon. Our waters are teeming with tarpon; but our preference is for other fishing, as we can get all the sport and exercise we want in landing fish that are as good to eat as to catch. We get colt-hitched-to-the-line business when we don't want it, in the sharks and jackfish that we have to fight it out with and that are just as gamy, fight just as hard, and the jack is just as long as the average tarpon.

If you never caught a jack it is worth a trip to Galveston to do so. I say to Galveston, because you stand up to it and fish at sea from the rock jetties, and you do the work at one end, and the jack at the other attends fully to his business, and will give you a sweat bath and all the work you want for from ten to thirty minutes; and when you find he does not weigh over fifteen to twenty-five pounds you can't take it in that it was only a jack on the hook.

We land a tarpon once in a while on the rocks. We fish with reels, line and hooks that would hold a tuna if the fisherman were in a boat and the fish did nine-tenths of the work of hauling the boat along for three or four miles.

It must be borne in mind that when tarpon are fished for on the coast of Florida or at Rockport, Tex., it is from a boat and in shallow water, say three to six feet. It is a different sort of fishing to land a tarpon in twenty or thirty feet of water and standing on the rocks. We think we can fish. We have fishermen who have averaged three days in the week for seven months in the year for the past ten years, who have the best tackle, and we think there is more skill shown in landing two tarpon in a season on the jetty than in three a day from a boat and in shallow water. If you want to "mix up" with tarpon, however, come and try them from a boat in the shallows of Galveston waters; the tarpon are here all right. It is no uncommon thing to lose a half a dozen hooks to tarpon in an afternoon's jetty fishing. When other fish are biting and we see a tarpon loafing toward our bait we reel in fast; or if he hooks himself, we turn down the end of the rod, put the brake on, and let him carry off the hook to remind him of the occasion.

Now, brother angler, do not for a moment suppose that the weather always suits, or the fish always bite when the wind, tide and water promise great sport. We draw blanks enough to make us enjoy the red-letter days when we catch mackerel until our arms ache, or more fish of other sort than we can carry.

When mackerel are in season, we do not think it an average day when a party of six or eight catch less than 75 to 125 pounds of mackerel in three hours and a sprinkling of other fish.

Did you ever catch a Spanish mackerel? You have to have a float, as he comes along at thirty miles an hour within three feet of the surface. When he strikes, your cork goes under, out of sight, as if shot out of a gun. If you hook, you do not know for a few moments whether it is a 3-pound mackerel or a 100-pound tarpon that you are "mixed up" with, and once in a season you may get an eight or nine-pound mackerel that makes you wonder whether you have come up against the leviathan of the deep. He is not only game to the last in the water, but as savage as a Spitz dog when you have him on the rock.

What the California fisherman call Catalina sea bass we call June-fish; they frequent the deep water of our jetties, do not grow quite as large as in the Pacific, but do grow to weigh from one to two hundred pounds. We never fish for them; we leave them to pot-fishermen, with a shark hook and a clothes line—main strength and awkwardness. We don't care to catch fish that have to be jiggered up when they sulk to

make them move. Any one who thinks there is sport in them had better not come to Galveston jetties unless he is willing to lose all taste for June-fish, by a knowledge of better things. A Los Angeles paper will give a column to every jewfish caught at Catalina, when certainly three out of every five times a man goes fishing on our jetties he gets better sport than a jewfish can give.

There are many fishermen that would come from New York or Chicago, to catch a jackfish from the rocks if they only knew the sport the jack will surely give them. Come and try it; there are plenty of them. We will spare our fellow Waltonians a few.

The facilities here for the fishing stranger are exceptionally good. Half-way out on the North Jetty, two miles and a half from land, is a house where accommodations for fishermen can be had at very reasonable rates; it is decently kept, and one can spend a week or so with a good boat and fish fare. A boat plies three times a day to the city, some seven miles away.

The Tarpon Club is a private club; our boat (combination sail and power) goes to the jetties at daybreak every morning that there is a prospect of fishing, returns at 12, and goes again at 1 P. M. Nine-tenths of the time many of the members of the club are away, and a fisherman, right, can nearly always be made a visiting member for ten days, with the same privileges as the annual member has; and can fish with as dignified and sober a crowd as ever spun fishing yarns; and can eat fish on the boat that will taste as good as they did when you were a boy.

G. E. MANN.

## Mascalonge or Maskinonge.

It was far from my intention or inclination to take part in the discussion of Mr. Chambers and his Canadian friends concerning the proper vernacular name of the mascalonge, as that subject has been thoroughly discussed in past issues of FOREST AND STREAM. I feel called on, however, to take up my flail and do a little threshing of this old straw, inasmuch as Mr. Chambers in FOREST AND STREAM of March 12, says:

"Dr. James A. Henshall credits Mr. Fred Mather with having investigated the origin and etymology of the word to a greater extent than any one else up to his time, and with having, as a consequence, deliberately favored the Chippeway form of the name—maskinongé, as opposed to the French derivation—masque allonge, and its variations. Yet in spite of this fact, and of the priority of the Indian over the French nomenclature, Dr. Henshall clings to the supposition that 'common consent and custom have decreed among the majority of anglers that it is mascalonge, and mascalonge it will be for generations to come.'"

The words are quoted from "American Game Fishes," (1892). In "Bass, Pike, Perch and Others" (Macmillan Co. 1903), I enter quite fully into the scientific and vernacular nomenclature of the mascalonge, to which I would refer any one feeling an interest in the matter. My opinion, as quoted by Mr. Chambers, is not a "supposition," but is, I think, a fact. Among angling authors who use or favor the name "mascalonge" I will mention Dr. Tarleton H. Bean, Edward A. Samuels, Charles Hallock, A. N. Cheney, Robert B. Roosevelt and Fred Mather, while, as stated, it is also used by a majority of anglers in the United States. Eugene McCarthy, author of "The Leaping Ouananiche," in his "Familiar Fish" (1900), favors the Indian derivation of the name but uses the form "muskellunge." And notwithstanding Fred Mather considered that the proper derivation of the name was from the Ojibway, and not from the French, he always wrote it "mascalonge," and never "maskinongé."

Mr. Robert B. Roosevelt, an uncle of the President, fished for many years in Canada, and always employed Indian or half-breed guides. In his "Superior Fishing" (1865), he invariably uses the name "mascalonge," with two l's. In his "Game Fish of the North" (1862), he says:

"The name of this fish is derived from *Masque allonge*, long snout, which is a translation from the Canadian Indian dialect, of *Masca-nonga*, words which have the same signification; and from corruptions of these two designations arise our common names. I took great pains to ascertain precisely how the Canadian boatmen, who are a cross of the Indian and Frenchman, pronounced this name, although in their French *patois* he is ordinarily called *Brochat*, and the best my ears could make of it was *Mas* or *Muscallung*, the latter syllable being guttural. But as the most sonorous, expressive and appropriate name is Mascalonge, it is desirable that all sportsmen should employ it."

I have fished a good deal in Canadian waters in Ontario, Quebec and New Brunswick, and my experience fully agrees with that of Mr. Roosevelt, as I never heard the term "maskinongé;" it was either mascalonge or muscallunge.

De Witt Clinton (1815), called it "muscallunga." De Kay (1842), used the common name "muskellunge," preferring it to maskinongé. Rev. Zadock Thompson was the first naturalist to give an accurate description of this fish; he conferred on it the specific title *nobilior* (1849), and used the vernacular name of "masquallonge." In "Bass, Pike, Perch and Others" I have retained the

specific name *nobilior*, as in my opinion the later name *masquinongy* is irrelevant and was bestowed on insufficient evidence. The generic name *Esox*, another good old name, having been rehabilitated and *Lucius* relegated to synonymy, the mascalonge has again come into its own name and estate as *Esox nobilior*.

Mr. Chambers bases his claim for "maskinongé" on priority, legislative enactment and a resolution of the North American Fish and Game Protective Association. While the law of priority is of necessity an immutable one in scientific nomenclature, it can not, for obvious reasons, be applied to vernacular nomenclature. Were it to be strictly enforced we would have, according to Longfellow (Hiawatha), the Indian names: Kenosha for pickerel; maskenozha for pike; sahwa for perch and ugudwah for sunfish. We would also have "trout" for the large-mouth black bass, as that name was the first to be bestowed by the English settlers of the Carolinas, though a question of priority might have arisen in favor of "salmon" and "chub" applied to the same fish by the English settlers of Virginia.

Common names are the result of custom and usage, and it is well if they can be made of uniform application, but this can not be accomplished by legislative enactment or resolutions. It will take some generations yet to relegate the name "trout" in the Southern States for the large-mouth black bass, and to firmly establish the name pike-perch for the Canadian names of okow, doré and "pickerel." I can join hands with Mr. Chambers in endeavoring to secure uniformity of common names for our game fishes, but in order to obtain this result we must adopt the name most in vogue, and it will be fortunate, indeed, should it prove to be both proper and distinctive. The Century Dictionary gives twenty variations based on the names mascalonge and maskinongé, and amid this embarrassment of riches we must choose as between mascalonge, maskinongé and muskellunge, though in regard to the latter name it is worthy of remark that the letter "u" has no part or parcel in either of the original derivations, Ojibway or French.

JAMES A. HENSHALL.

## Newfound Lake Fishing.

NEWFOUND LAKE, Bristol, N. H., March 5.—In Newfound Lake landlocked salmon and lake trout fishing is good from April to Sept. 1. The lake, entirely surrounded by hills, lies partly in the towns of Bristol, Bridgewater, and Hebron. It is fed by numerous springs, the water having a general depth of from forty to one hundred feet, thus making a cool abiding place for the trout and his royal cousin, the landlocked salmon.

Bristol is on a branch road, thirty-two miles north of Concord, 107 miles from Boston. The fishing season—trolling with live bait—opens about April 15, or as soon as the ice clears from the lake. Each year's fishing record is an improvement over the previous one, more fish having been taken last season and a larger number per diem, thus the Fish and Game Commissioners' plan of artificial propagation (which was so severely criticised and ridiculed here by some local fishermen a few years ago), is now showing good results. The lake is kept well stocked with game fish, and it is now understood by store-keepers and summer boarding houses that it is to their financial advantage to see that the fishing shall be along the line that the commissioners have laid out.

It is up to Commissioner Wentworth to answer certain allegations made out against him in the local paper as to why certain fish that he has put in, or caused to be put in, do not bite. In the first place, a summer sojourner, writing from Philadelphia, asks what species of whitefish were put in Newfound, as he has never caught one. Mr. Wentworth answers, "The whitefish put into Newfound Lake are the true whitefish of Lake Michigan." Then follows the discussion whether they will take the bait. One gentleman of Laconia writes that the fishermen at Lake Winnisquam take quite a number through the ice with bait, one man taking twenty-four in one day's ice fishing. The largest known to have been taken weighed 5½ lbs. Other fishermen maintain that whitefish were seldom, if ever, taken with the hook; so the question is put squarely to the Commissioner, Why do not the whitefish in Newfound bite?

The second count is by the same gentleman, as follows: "Why are not smelt caught with hook and line in summer in Newfound, as I have done in Lake Sunapee for bait and pan. Will Mr. Wentworth tell me why?"

Then the third and last count is by a resident on the shore of the lake, who in the local paper asks, "Why are not the white perch, of which there are a number in this lake, caught with hook and line, as the writer has seen done in other New England lakes. Will Mr. Commissioner tell us why?"

The reason why smelt are not caught with hook and line in this lake is advanced by our local fishermen as being that there are not any to catch, and that's the answer. The determination of men and boys to net any that run up the brooks in spring to spawn is answer enough.

SAMUEL HENTALL.

## The Massachusetts Banquet.

THE annual dinner of the Massachusetts Fish and Game Protective Association, celebrating the thirtieth anniversary of its incorporation, was held at the Hotel Brunswick on Friday night, March 18. President W. S. Hinman presided. Among the guests of the evening were Chairman J. W. Collins, of the Massachusetts Fish and Game Commission; L. T. Carleton, of the Maine Commission; Wm. H. Boardman, of the Rhode Island Commission; the Rev. Dr. W. H. Rider, of Gloucester; Hon. Salem D. Charles; General A. O. Davidson; Hon. R. S. Gray; S. O. Staples, member of the Legislature; A. W. Robinson, former president of the Megantic Club; J. D. Loud; Nathan Tufts; Dr. Martin, of Franklin; Dr. Wm. Conant; Col. Stoddard, A. C. Mitchell, and others of the Middlesex Club. Ex-President Wiggin, and Mr. Nash, of the Committee, were absent because of illness. Guests and members numbered more than one hundred, and the occasion was one of the most delightful in the long series of the Association reunions. When the time came for the speaking, President Hinman reviewed the history of the Association, which for nearly a third of a century has been a force in protecting the game and the fish of the commonwealth.

"The purpose of the organization," said President Hinman, "is not to kill. One-half of the men who compose its membership never wet a line nor pull a trigger. Its membership is composed of sportsmen from the Cape to the Berkshires, and we are afflicted with numerous agricultural, horticultural, sportsmen's and gun clubs. We have done much work in the past, and are active to-day.

"Perhaps all of us are not aware of the fact that about 95 per cent of the quail in the covers of the State have died during the past winter. Not 5 percent of the quail in the covers last October have survived the severe weather and deep snows of the past months. We have made repeated efforts to save the birds by feeding, but the grain which has been put out has been covered by the snows. Ice has formed a crust, covering the birds, which perished miserably under the snow, sleeping huddled on the ground as they do.

"While the hardy New England partridge has doubtless wintered better, many of even the fur-bearing animals have suffered. Even the thrifty fox has been forced by hunger to come off the hills to be fed in the farmyards. We have done what we could to save the birds and are setting about making up the loss. We have 90 dozen quail ready to be put out and have contracted for 150 dozen more. We stand ready to purchase 1,000 dozen quail this spring to restock the covers.

"We plead for our birds and animals which make their abode in the remote places. We strive to care for them as best we can, as well as our domestic animals are sheltered and protected. We are not an organization formed for the fostering of the killing spirit. We aim to protect our native wild birds and animals and hand them down to our children."

The Rev. Dr. W. H. Rider, of Gloucester, in a happy vein, compared modern fishing tales to the story of Jonah and the whale and the Hebrew story of the quails. Here he told an entertaining narrative of his trip down the west branch of the Penobscot and lauded the man who catches and kills only what he wants, deprecating the men who kill for the sake of killing and belittling the so-called sportsmen, who take trout only to have them rot in the sun. He advocated a concerted movement for the removal of the present fine attached to most of the game laws of the State, and favored imprisonment. He was greeted with three cheers, given standing, as he finished his eloquent address.

Chairman L. T. Carleton, of the Fish and Game Commission of Maine, said:

"We in Maine are engaged in the protection and propagation of fish and game within the borders of our State. I cannot tell you of the beneficial influence of the support of an organization of this kind. The power of such an influential body of professional and business men cannot be overestimated.

"We have found in Maine that laws are necessary. In Maine for many years men were permitted to come and go and kill at will, until our beautiful lakes and streams were almost depleted and there was scarce a track of deer or moose in our broad forests. We found that laws were indispensable. We followed the example of Moses, the great law giver and creator of the first game law when he laid down the commandment: 'Thou shalt not take the mother bird from the nest.' This is the rudiment and the purpose of all game laws. We believe there is not so good a State in the Union for the out-of-doors life as ours."

Capt. J. W. Collins, Chairman of the Massachusetts Fish and Game Commission, spoke of the immense moral and practical value of all similar associations and expressed his appreciation of the unvarying support which the Massachusetts Association had always given his Commission.

Charles W. Bartlett told a number of stories, fishy in the extreme, of his experiences at the Rangeley Lakes in Maine, and Walter R. Terry narrated stories of the halibut and salmon fishing on the Spokane River in Alaska. The Hon. Salem D. Charles, Chairman of the Street Commissioners, ascribed the success and advance of the Anglo-Saxon race to its love for nature and the wild and the chase and hunt. He lauded the pursuit of health of body and rejuvenation of mind along the valleys and over the hills and along the streams.

"To those of us who have been there," he said, "there is no delight to compare with the hour in the log cabin in the stillness of the Maine woods, with the very perfume of nature in the air. There is health and beauty and true enjoyment in it that exists nowhere else."

Charles Wilson had a fund of Scotch stories and M. T. Callahan told many amusing anecdotes of the son of Erin. Thomas Hall sang several songs.

Henry Hurlburt drew a comparison between the law and fishing and hunting and told of his effort at farming pheasants. The Hon. William S. Morse told of the value of proper legislation, and President Hardy, of the Middlesex Fish and Game Protective Association,

lauded the influence of such organizations. The evening closed with the singing of "America."

A pleasant feature of the evening was the entrance of a member of the club in the garb of a farmer, intent on searching out a member of the club who shot his chickens for quail and his hens for partridges. He wore a police badge as big as a Roman shield and his noisy entrance, amid protests of President Hinman and the feigned efforts of a half-dozen waiters to eject him, was a genuine surprise.

The success of the anniversary celebration was due to the committee composed of President W. S. Hinman, George W. Wiggin, A. R. Brown, N. LeRoy, C. W. Dimick, M. H. Richardson, N. C. Nash, M. A. Morris, B. C. Clark, Gilmer Clapp, Rolin Jones, J. R. Reed, Thomas H. Hall, A. D. Thayer, and Secretary H. H. Kimball.

## Fishing on the St. Lawrence.

*Editor Forest and Stream:*

The only disappointment awaiting the visitor to the beautiful Thousand Islands is the small catches of the most faithful and skillful angler. Thirty years ago we could always depend upon our breakfast of fish within fifteen or twenty minutes' time; but now we fish all day for the same catch and only succeed by visiting distant waters. What causes this difference? Of course, there are more fishermen now, and steamers may drive the fish away; but to my mind the chief cause lies in the destruction of fish by the minnow peddlers, who go up and down the river with their long net, sweeping every minnow from the quiet bays where the water is warm and shallow, two of the prerequisites for safety and comfort of minnows. Several years ago I cleaned out my harbor between my landings, and by scattering food there, attracted the fish, so that by letting down a yard square net I could catch bait at any time; but the minnow peddlers would come with their fifteen-yard nets and sweep every fish from my harbor. These fellows are an impudent set, whose only stock in trade is a net, a leaky old boat worth \$5, and a barrel for the fish. They never pay anything to improve property or a dollar of taxes, and yet they have more privileges than those who have paid thousands of dollars for improvements, and are heavily taxed to keep the beautiful river a desirable summer resort. They catch enough fish with one sweep of their net to supply a whole colony of cottagers for a season, provided they were allowed to grow to maturity. I have watched them many seasons, and I have never seen them throw any back after a haul. I will venture that half of them are game fish and the rest are food fish for the game fish; so in either case, it works disappointment to the angler. Unless these depredators can be stopped soon, fishing among the Thousand Islands will become a roaring farce.

All of the cottagers deplore the evil, but seem helpless to remedy it.

I write this in the hope that those interested may agitate the matter until these sweep nets are abolished.

DR. C. E. LATIMER.

## How Claren Caught his Fish.

From the Young Contributors' Column of the Brooklyn Eagle.

LAST summer, when I was in the country, a little boy by the name of Claren Sowle moved into a house near us. Claren was five years old, and he liked to fish very much. The first week he was there he fished every day, but did not catch any. One day he said to his mother:

"Mamma, I know why I don't catch any fish."

"Why, Claren?" she asked.

"Because they see that I am a little boy, and then they don't bite. Do you know what I am going to do?" he added.

"What, Claren?" she asked.

"I'm going to put papa's hat on, and see if they won't bite then."

So Claren put his father's hat on and went fishing. He caught four large trout.

"Mamma," he cried, when he came home, "I fooled the fish. They thought I was a big man, and look at what I have got," he added, holding up his prize.

WALTER V. MOORE.

## How Savarin Fried Fish.

In Savarin's "Physiologie du Gout," which was, according to Balzac, a veritable decalog, irrefragable as the laws of Kepler, is thus set down the way to fry fish: "The beauty of a good fry is in carbonizing or browning the surface by sudden immersion—the process known as 'the surprise.' It forms a sort of vault to inclose all that is valuable, prevents the fat from reaching it, and concentrates the juices so as to best develop the alimentary qualities. Don't forget when you have any of those trout weighing scarcely more than a quarter of a pound, and fetched from streams that murmur far from the capital—don't forget, I say, to fry them in the very finest olive oil you have. This simple dish, properly served with slices of lemon, is worthy of a cardinal. In exactly the same way you should treat smelts, of which adepts think so much."

Have you, my dear housewife, have you ever tried to fry your fish this way? Have you ever cooked small fish in deep boiling oil or lard in the way you would a doughnut or a cruller? Did you ever fry your meat croquettes this way—or are they generally soft and greasy out of a shallow pan?—Good Housekeeping.

## Kipling's Pacific Salmon.

WASHINGTON, D. C., March 14.—*Editor Forest and Stream:* "H." will find Kipling's statement that the Pacific Coast salmon rose to his flies, in "From Sea to Sea," Part II, Chapter XXVII, page 108 (Scribner's). "He [the salmon] broke for the fly and got it!"

E. H.

NEW YORK, March 19.—*Editor Forest and Stream:* If your correspondent will refer to Kipling's "From Sea to Sea," Vol. II, page 37, et seq. (Doubleday & McClure edition), he will find the description he asks for of the salmon caught with a fly in an Oregon stream by the author.

E. B. ROGERS.

## Carp Stop Sawmills.

A PRESS dispatch from Grand Rapids, Wis., says that for several days carp have filled the river around Hastingford in such numbers that saw mills and grist mills have been obliged to shut down, as the fish get into the waterwheels and make it impossible for them to run. The fish are of large size, 10-pounders being common. This is the spawning season for carp, and they leave the big streams and crowd into water two to four feet deep.

## The Kennel.

### English Law of Trespass.

CAN a trespasser sue for damages for injuries received while trespassing—e. g., from the bite of a dog? His Honor Judge Addison has held that a boy who had wilfully trespassed upon premises where he had no business to be, and was bitten by a dog there, was entitled to damages, the county-court judge drawing a distinction between such a person and a burglar. The Law Times ventures to doubt the correctness of this decision. The older authorities lay it down that a trespasser cannot sue for injuries received while trespassing. Modern writers qualify this doctrine. It is said by some that, although the trespasser is liable to an action of the trespass, he is not thereby debarred from suing for an injury which might be occasioned to him. The proper view, says our learned contemporary, seems to be rather this, that a person going on to property on lawful business has a right to be protected against traps, and also against obstacles wilfully placed in such a position as to be likely to cause injury. For instance, a person would not be justified in putting a savage dog in the way of access to the house, so that persons innocently coming for a lawful purpose might be exposed to attack. But the case is very different where a person strays from the ordinary approach to a house and trespasses on the adjoining land where there is no path. Here, if he sustains an injury not caused by any wrongful act of the owner, he has no remedy, as obviously he has only himself to thank for the mischief. The boy in the case referred to was really a trespasser, and, therefore, would seem to be disentitled to an action in respect of any injury to which he was a contributory party.—Shooting Times.

### Points and Flushes.

Mr. F. R. Hitchcock, a member of the Eastern Field Trials Club, and until a few years ago one of the most active contestants in the field trials of America, was elected president of the Saratoga Racing Association on March 17. Mr. Harry Payne Whitney was elected vice-president, succeeding Mr. Hitchcock. Mr. Hitchcock is a steward of the Jockey Club, and has a stable of race horses under the care of W. P. Birch. Mr. H. B. Duryea has leased the running properties of the late W. C. Whitney stable, of Mr. Harry Payne Whitney as executor.

On March 8, Mr. S. E. Shirley, J. P., of Ettington Park, Stratford-on-Avon, and Lough Lea, Carrickmacross, Ireland, died in London. He was president of the English Kennel Club. He also was its founder, and was identified with it conspicuously since its organization in 1873. He was a noted dog breeder and bench show judge.

Mr. G. T. Teasdale Buckell, of London, England, visited FOREST AND STREAM office for a while on Thursday of last week. He has swung around a large circle of United States in which the setter and pointer of high degree abound; that is to say, Georgia, Tennessee and Chicago. Mr. Buckell was the chief breeder of the setter now known as Llewellyn. While in this country he purchased some setters which he will take with him to England. On his return he will write for publication some American notes, which from his sane and prolific pen will be both entertaining and instructive.

## Khama.

Now THAT so many American yachtsmen have imported British boats, both sail and steam, the news that another vessel has been purchased does not cause the widespread comment and interest it would have done a decade ago. We now look upon each new English yacht that is brought out to the States very much as though the boat had been built in one of our own yards.

English-built boats have played an important part in the history of American yachting during recent years, and there is now to be found in our waters the pick of the British racing vessels. The importation of British yachts has been of great benefit to our yachting in every way and their remarkable beauty has always been a subject of much comment, while their substantial construction and careful rigging have proved valuable object lessons.

A few years ago bargains were to be found in the British yachts, but that day has passed and Americans buying boats abroad now pay for them all they are worth, and the expense of the ocean trip runs the investment up to a tidy figure. Then again, after the boats reach this side, considerable money has to be expended on the interiors, which have to be refitted to make them suitable for our requirements and climate, both of which differ materially from the conditions prevailing on the other side.

The last of the notable English boats to make an appearance in our waters was the handsome Fife cutter Khama. This vessel was purchased early in 1903 by Mr. Seymour J. Hyde, of New York city. Mr. Hyde has been closely identified with American yachting for the past twenty years, and he has owned many well known yachts. Two trips were made to England by Mr. Hyde before deciding on Khama, and he looked carefully over all the modern vessels of about her size. Mr. Hyde at that time owned the 35ft. waterline Fife yawl Albicore, which he afterward sold. He had used Albicore several seasons, and she proved to be such an admirable boat that he made up his mind to purchase another Fife production.

Khama was made ready for the ocean voyage as early last season as was possible, but considerable difficulty was experienced in procuring a crew. After some delay a crew of eight men was shipped. The navigator and the captain had some difficulty soon after starting, and it was decided to put back. The captain quit the vessel, and another man was given the billet. The new officer had crossed the Atlantic three times before in yachts of about Khama's size, and when he came aboard he found she was not suitably fitted for the long and hazardous trip. No life lines had been rigged (these boats only have a very low rail), and her skylights were not properly protected; these and many other things necessary for the

safety of those on board were lacking. More time was lost in having stanchions made for the life lines, and heavy wooden boxes to cover the skylights. Finally the boat was equipped to suit the new officer's ideas and a second start was made. When off the Tuskar—a light on the Irish coast—a vicious gale was encountered, and Khama was put back to harbor for the second time. These delays were most vexatious, and after repairing some minor damage done during the storm, she made a third start. This time she kept on and came through to New York without accident or incident worth recording.

Khama made the passage under a jury cutter rig, and a good idea of her appearance may be had from the photograph that accompanies this article. Alternate gales and calms were met with and she consumed something less than a month in making the actual voyage. No head winds were experienced, but either it blew so hard she was under a reefed trysail or else she was becalmed, and had it not been for the continued flat weather a faster passage would have been made.

The writer talked at length with the officers and crew that came out in Khama, and all agreed that she was a very fine vessel, and an admirable sea boat. A considerable quantity of case oil was carried for use in case of emergency, but none was required even in the worst weather.

Khama showed signs of having met bad weather on her arrival, but she was not strained in any way, and no

damage was done but what paint would rectify. She was towed to Jacob's yard, City Island, as soon as possible, and the work of overhauling and refitting was commenced. Her deck was scraped, and the paint was

Khama Racing in British Waters.

Khama—Showing Jury Rig. Photo taken just after her arrival at New York.

Khama Racing in British Waters.

burned off her topsides. In a few days she began to present a smart and ship-shape appearance. Her bottom is coppered, and the metal was found to be in perfect condition when she was hauled out, and there was not the slightest sign of growth anywhere and no wrinkles in the copper.

All the yacht's racing sails were sewed up in burlap and stored below. This proved to be a mistake, for some of them became damp (the hatches were almost constantly closed, and little or no air found its way below), and as a result mildewed. The usual custom is to send such gear out by steamer, as the yacht is more buoyant without the extra weight, and the sails are less liable to be injured.

Khama was designed by Mr. William Fife, Jr., and built by Messrs. William Fife & Son at Fairlie, Scotland, in 1900, for Mr. James Knott, of Glasgow. She was only in commission in 1901, the year she came out. Her owner did not put her overboard the second season, as practically all the racing boats in her class were on this side, having been purchased by Americans.

Khama is a very handsome vessel. Her ends are long and graceful, and her low freeboard gives her a very shippy look. She is very much like Isolde, both on deck and below. Her construction is composite and her planking is double, the outer skin of which is mahogany. Below her arrangement is identical with that of Isolde, both in size and fittings. If one was not familiar with certain details it would be difficult to tell which vessel one was aboard, Khama or Isolde. Even the upholstery is of the same material and design.

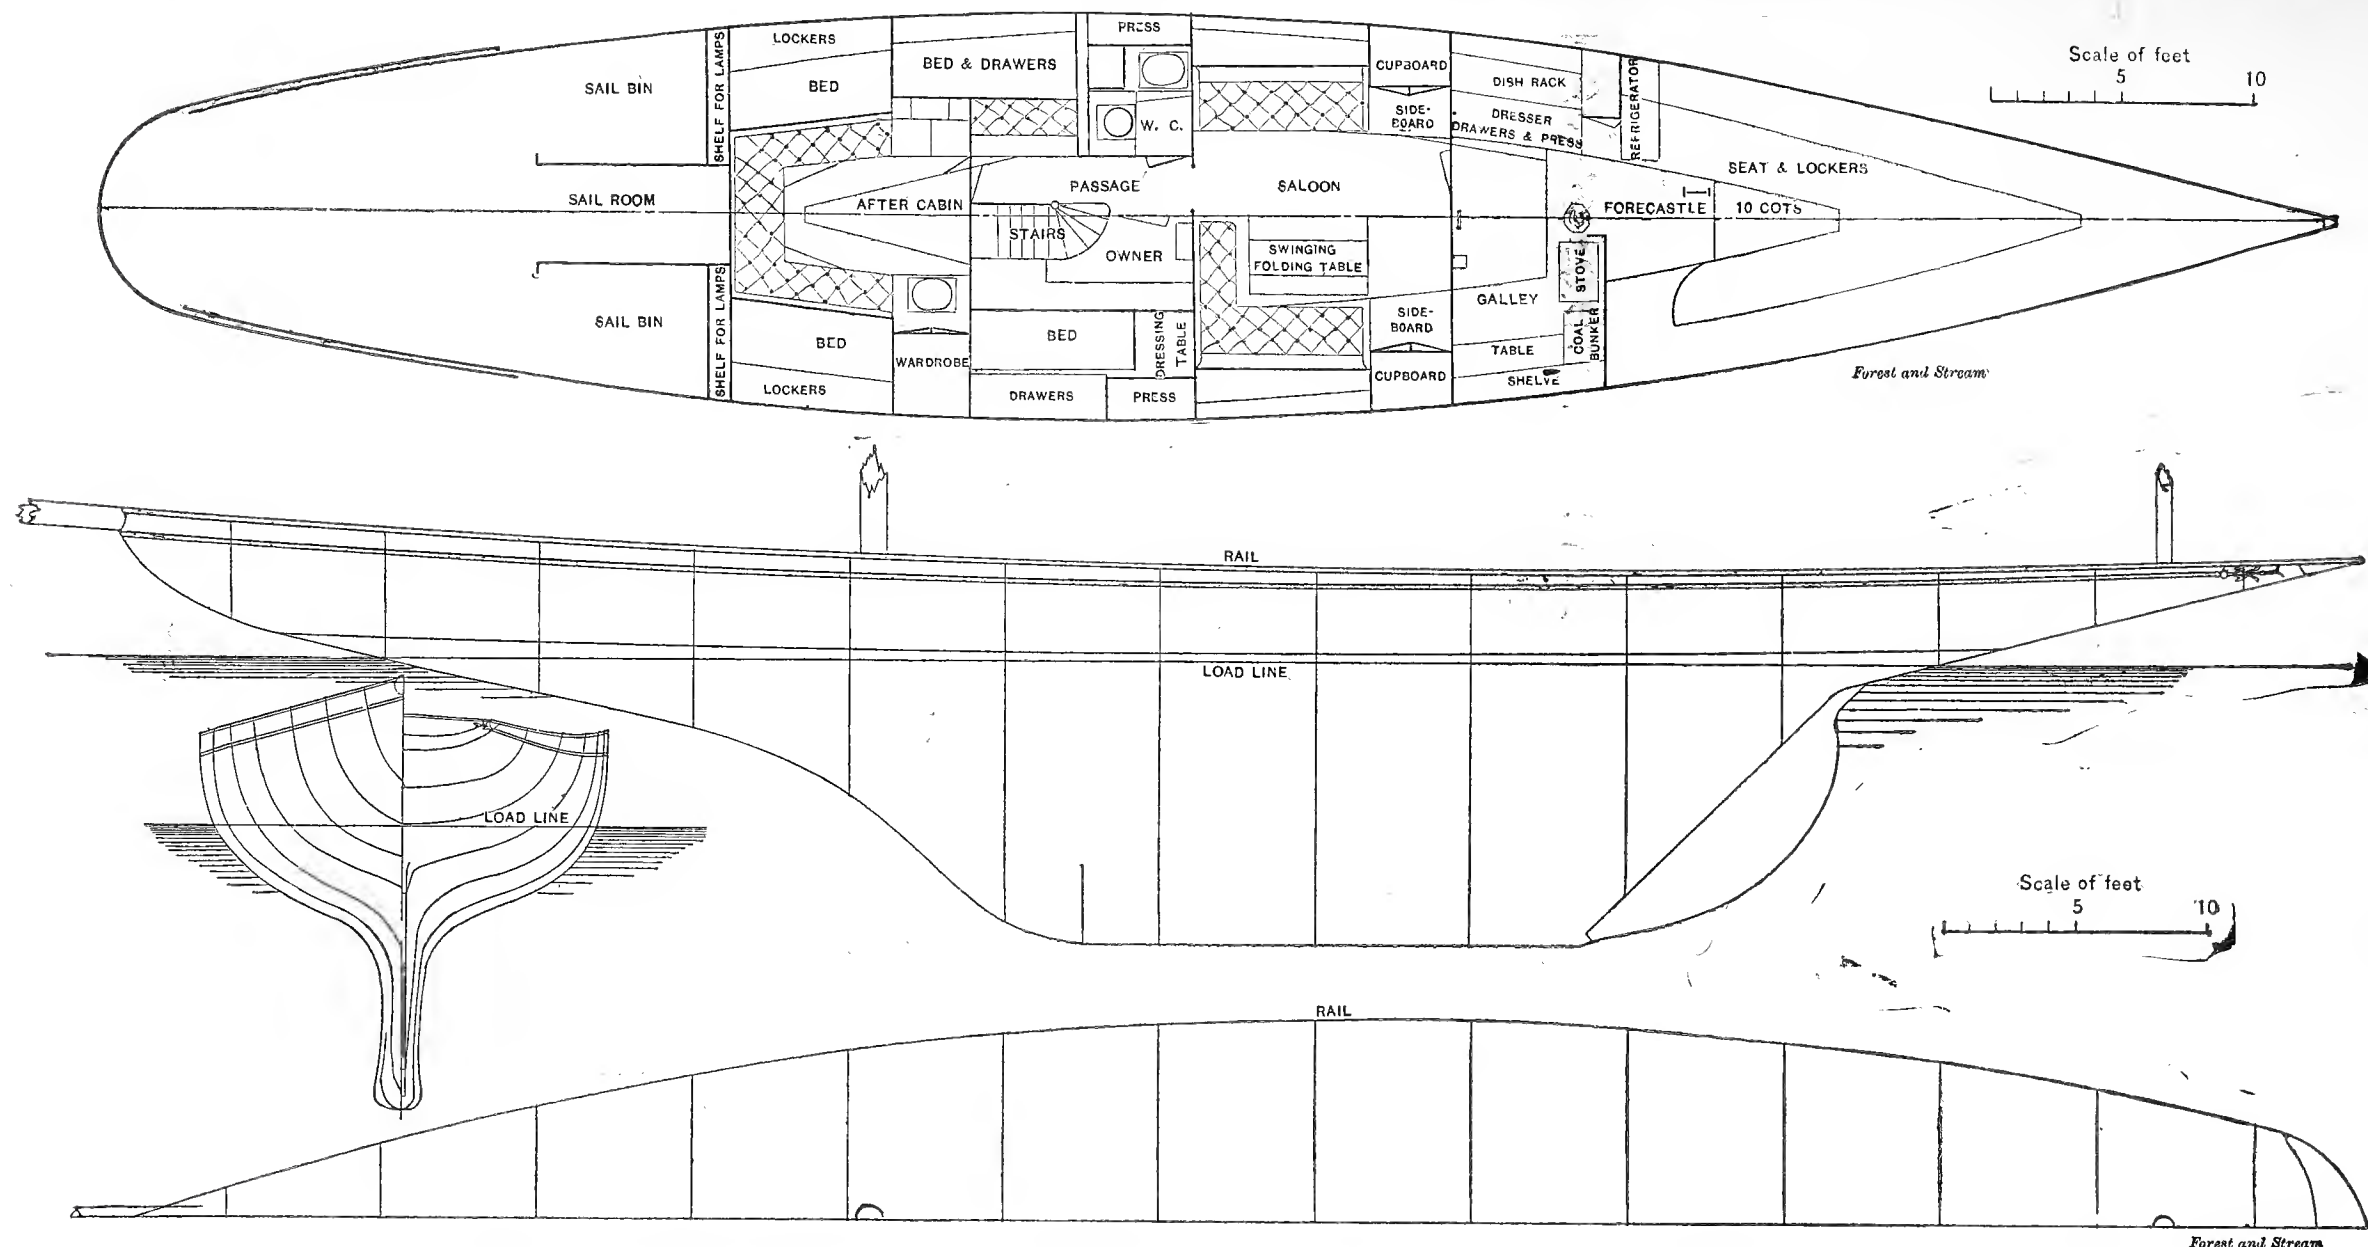

The companion leads to a steerage with a berth and a toilet room to port. Opposite on the starboard side is the owner's room. Aft is the ladies' cabin, and forward of the steerage is the main saloon. Forward Mr. Hyde made some changes; the captain's room was removed and that space was thrown into the galley. This made unusually fine quarters for the steward and cook to work in.

Her dimensions are as follows:

Length—	
Over all	86ft. 6in.
L.W.L.	60ft.
Overhang—	
Forward	10ft. 6in.
Aft	16ft.
Breadth—	
Extreme	15' 1. 6in.
L.W.L.	14ft. 9in.
Draft—	
Extreme	10' 1. 9in.
Freeboard—	
Bow	5ft.
Stern	4ft.
Least	3ft.
Sail area (cutter rig)—	
Fore triangle	1,511.12 sq. ft.
Mainsail	2,239.97 sq. ft.
Topsail	704.13 sq. ft.

Total 4,455.22 sq. ft.

KHAMA—LINES AND CABIN PLAN—DESIGNED BY WM. FIFE, JR.—OWNED BY SEYMOUR J. HYDE.

Mr. Hyde disposed of his English crew soon after the yacht's arrival, and most of the summer Captain Clayton Haff was in charge. Six Scandinavians were carried in the crew in addition to the steward and cook.

We show two sail plans, the one of the cutter rig which she carries at present, and another of a yawl, which Mr. Hyde contemplates adopting. Khama now steers with a long tiller, but a wheel will probably be substituted this season.

Little is known of Khama's speed, as Mr. Hyde did not race her any to speak of, only participating in two or three of the racing runs on the N. Y. Y. C. cruise. While she did not get any prizes on these occasions, she showed up very well.

## British Letter.

THE new Clyde 36-footer restricted class continues to attract northern sportsmen, the latest supporters being Messrs. B. G. Allan and T. C. Glen-Coats, who have ordered boats from Mylne. The class now consists of seven owners, all well-known and experienced yachtsmen, and with two such designers as Fife and Mylne providing the lines of the boats, there will, no doubt, be a lot of keen and healthy rivalry in the class which gives every promise of flourishing. The boats will conform to yacht racing rules and regulations as far as is compatible with local conditions. As a class they are deserving of success, but it is not without a feeling of disappointment that one learns they will probably cause the disappearance of the 36ft. Y. R. A. class, started in 1902, and which provided a large share of sport for two seasons. Falcon, Eusay and Eileen are in all probability not to be fitted out unless they change hands, so that the smart little Mylne designed Barabel, which has been champion of her class during both seasons, will be the only representative, and Mr. MacIver is hardly likely to go to the expense of fitting her out, unless he has something to race against. The new restricted class is also cutting deeply into the Clyde 23ft. length class; in fact, Mr. Leckie's champion, Cymbeline, is about the only boat spoken of as likely to fit out. Although the new restricted class will consist of boats in every way worthy of the sport they are to maintain, it certainly seems a pity that their existence should prove fatal to the other classes above mentioned, which have shown such excellent form; and it is most sincerely to be hoped that new blood will be infused into them to save them from extinction. The racing between Falcon, Eusay, Eileen, and Barabel was one of the leading features of the Clyde regattas last year, while, as for the 23ft. class, they have been an institution so long, and a training squadron for amateurs, that their disappearance would cause a gap which it would, indeed, be difficult to fill.

The famous old 40-toner Norman has been purchased by Professor D. W. Finlay, who was formerly one of the leading amateur yachtsmen on the Clyde, and the 40-rater Vendetta has been sold by Mr. W. W. MacClellan, and will leave the Clyde for southern waters. Norman is so well-known that it is impossible to add to the long string of doughty deeds performed a quarter of a century ago by her when in charge of Tom Diaper. Vendetta's career has not been so successful as that of Norman. Built in 1893, for Admiral the Hon. Victor Montagu, from designs by the late Arthur E. Payne, she found in the Watson cutter Carina a far too formidable opponent, and was early disposed of by the admiral. Vendetta was Payne's second attempt at a vessel of this size, his first being Corsair, also the property of Admiral Montagu. Corsair was a much more moderate type of boat with the then characteristic short knee bow, so common among the small raters designed by Payne, and generally known as the Payne bow. In Vendetta the Southampton designer produced quite an extreme type of boat with great beam and im-

mense overhang for that period. It was soon found out that Vendetta was too big for her sail area, and it was only in broad reaching in a fresh wind that she showed her great speed. She was laid up for a time, and for some years has been raced in the handicap classes on the Clyde under the flag of Mr. MacClellan with a fair amount of success. Vendetta will be a distinct loss to the district.

At the annual meeting of the Solent Classes Racing Association, which was held at the Royal Portsmouth Corinthian Y. C., Portsmouth, Feb. 27, Colonel Bucknill made a proposal to start a cruiser class as a Solent class with American ratings and Yacht Racing Association time scale. The proposal was discussed, but did

times of tide, and the Bridlington Town Council and Harbor Commissioners have combined with the railway company in their efforts to improve the locality for yachtsmen.

Additional accommodation is to be provided for yachts lying alongside the quay, and it is proposed to lay moorings outside for larger yachts. Under these circumstances the Royal Yorkshire Y. C. has decided to hold its annual regatta at Bridlington, and the fixture will be extended to a week. This is emphatically a move in the right direction, as few places are so unfitted for yachting as the waters of the Humber, especially in the vicinity of Hull. The courses, too, were necessarily monotonous, being merely down the Humber and back; whereas, in Bridlington Bay is a fine, open expanse of blue water, free from the terrific tides which are the *bête noir* of yachtsmen on the Humber, so that a big triangular or quadrilateral course can be laid. If this new programme is adhered to the regattas of the Royal Yorkshire should receive a fillip which they would never have had as long as the venue was the muddy and swift running Humber.

E. H. KELLY.

## Challenge for Manhasset Bay Cup Accepted.

Mr. Edward M. MacClellan of the Manhasset Bay Y. C. has notified Mr. T. Alfred Vernon, secretary, and Henry J. Gielow, chairman of the regatta committee of the Atlantic Y. C., that the challenge for the Manhasset Bay challenge cup has been accepted.

Mr. MacClellan sent the following letter to Mr. Alfred T. Vernon:

Edward M. MacClellan, Secretary,  
Manhasset Bay Yacht Club,  
No. 90 Water Street,  
New York, March 15, 1904.

T. Alfred Vernon, Secretary Atlantic Y. C. City:  
My Dear Sir—Referring to your letter of Feb. 19, containing challenge of the Atlantic Y. C., on behalf of the sloop Bobtail, for a match for the Manhasset cup, I beg to advise that your letter was placed before the trustees of this club at a meeting held on the 11th inst., and the challenge of your club accepted.

The arrangement of details connected with the match has been placed in the hands of Mr. Charles D. Mower, chairman of our race committee, who will at once take this matter up with Mr. Gielow, of your club.

It has given us much pleasure to have received the first challenge for this season from the Atlantic Y. C., and we trust that the races of the match will prove to be as successful as were those of last year. Yours very truly,

E. M. MACCLELLAN, Sec'y.

## Speed Launch for C. V. Brokaw.

At Woods' yard, City Island, there is building a speed launch, from designs by Messrs. Tams, Lemoine & Crane, for Mr. C. V. Brokaw. The boat is 50ft. long, and is double planked. She will be equipped with a 150 horse-power Smith & Mabley simplex that will make 850 revolutions and not weigh more than 2,000 pounds.

The steam launch Buccaneer has been sold through the agency of Messrs. Tams, Lemoine & Crane, to Mr. F. A. Keep, of New Orleans. The British steam yacht Surf, owned by Mr. F. D. Lambert, has been chartered by the same firm, to Mr. Alfred W. Hoyt, of New York city.

## Thordis Changes Hands.

Mr. Charles A. Heney, of Boston, has sold his 25-footer Thordis through Messrs. MacConnell Brothers, of this city, to Mr. D. C. Newman Collins, of New York. The same firm has sold for Mr. Walter Murray Beiling, of Bayonne, N. J., the 21-footer Eaglet to Mr. Edmund Reeks, of New York.

Mr. Calus C. Bragg, has sold his schooner yacht Alsacienne, ex-Norseman, through MacConnell Brothers, to a prominent eastern yachtsman. The same firm has sold the 79ft. steam yacht Navarch to Mr. Gilbert E. Orcutt, of New York City.

Khama being overhauled at City Island.

not receive much support and was not put to the meeting. An amendment, however, was carried to the effect that a small handicap class be formed for this year only, to consist of boats between 5 and 20 tons, and that the Solent clubs be asked to encourage it and notify in their fixtures the dates of the cruiser races. This is a much better idea than that of Col. Bucknill, for whatever may be the merits of the American rating rule, it is at present an unknown quantity, and, as the idea of the cruiser class was to fill up the gaps caused by the disappearance of the 36ft. and 30ft. classes, it is not contemplated that the class will be a permanent one.

For some years the members of the Royal Yorkshire Y. C. have been considering the advisability of transferring their annual regatta from the Humber to Bridlington Bay, and no doubt this would have been done long ago, but for the lack of accommodation for yachts in Bridlington Harbor and want of deep water. The North Eastern Railway Company has now offered to provide a powerful dredger for the purpose of dredging out the harbor, so that yachts may lie afloat at all

# A Long Island Cruise.

## A Power Boat Trip from Jamaica Bay to Peconic Bay.

BY GEORGE E. CRATER, JR.

A MAN who has never experienced the sensations of an earnest sportsman, has yet to learn how to live.

I shall tell you of a little cruise which I took with my friend, Mr. W. H. Norledge, an Englishman, who appreciates sport in the broadest sense and who cast his fortunes with mine on the morning of July 5 last.

We had talked over a way of spending the holiday of the day before, and had agreed that we should go to my club, located on the shore of Jamaica Bay, view the fireworks of the Fourth and dine together at the Oriental, at Manhattan Beach.

Accordingly, on the afternoon of the Fourth, we journeyed together to the club, and finding a comfortable and cool spot on the veranda, we at once set about to refresh with the aid of some good cigars and the proverbial Scotch high ball.

We enjoyed the yacht races provided by the club for the amusement of the club members and their guests. Before us lay the *Americus*, a trim little craft, of 20ft. waterline, of which I was a modest owner. Her little 3 horse-power engines had been carefully cleaned and the canvas hood had been snugly adjusted by the boatman in charge of the club wharf.

We soon caught the enthusiasm of our brother yachtsmen as they raced their sailing craft in an earnest endeavor to merit the approval of the ladies present, and incidentally, to win a club trophy. I could not stand the strain a moment longer and at once set about in a vain endeavor to find some of the other members who owned small power craft, with a view of arranging a match.

It may be well to say that I had not heard that the builder of the *Americus* had previously raced this little skimming dish against every 20-footer in the bay and on both sides of the island, and had easily won every match.

I was keenly disappointed in failing to find anyone who was willing to try his steel with me, and I hastened back to my friend, and for a half hour found myself in deep thought. At last I hit upon an idea which afterward proved most delightful, and was a trip long to be remembered. I shall attempt to describe it for you, for I am sure you will be interested and it may be instructive.

First, let me say that I am an amateur, and my friend likewise, so if we do not use the vernacular of the yachtsmen, you must overlook and try to enjoy our experiences without criticising us. On this memorable evening, I suggested to my friend that we stay all night at the hotel and get a good early start in the morning and cruise up the coast and in through Jones' Inlet, and thence through Great South Bay, through Shinnecock Bay, the canal to Peconic Bay, and down Peconic Bay to Craterdale, a summer place of which I was very proud, and which was located on Peconic Bay, at Red Cedar Point, about seven miles east of Riverhead.

My friend was quite agreeable, and we set about making preparations; the commodore of the club tried to persuade us that the proposed cruise with the *Americus* would be a dangerous undertaking and advised us not to attempt an outside trip in so small a craft.

His interest was well meant, but we could not allow our seamanship to be thus questioned, aside from casting an insinuation on the *Americus*, which boat we were very fond.

Neither my friend nor I had ever been over the course we outlined, and did not know exactly how we were going to accomplish our task. We finally decided that we must employ a pilot and immediately interrogated the commodore and other club officers, who informed us that they knew of no one who would attempt the trip in the *Americus*, which made us the more determined.

We finally found a life saving station, and after the usual refreshment and cigars at a nearby resort, a pilot, by the name of Davis, agreed to go with us and see us through the inlet. Accordingly, it was arranged that he should have breakfast with us at Hales' store and restaurant, the only place open at 4 A. M., the next morning, and that we would get away at sunrise.

After putting on 5 gallons of gasoline, 76 proof, and filling the stationary gasoline tank of the *Americus*, we spent the evening watching the people, who seemed to find amusement in sitting at tables and eating all sorts of horrors, and drinking the queerest mixtures. Being the night of the glorious Fourth, we found much amusement in "slumming," and finally retired at 3:30 A. M., for we had but one hour to rest before we had arranged to breakfast with the pilot.

A heavy knock at the door reminded us that the hour was up, and we hastily put on the few garments which we had removed, and hurried out into the glorious morning; and such a morning, the birds were singing everywhere, and far above us a flock of wild geese were winging their lazy flight over the placid waters of Jamaica, evidently bound for some far off feeding ground.

We hurried on to the restaurant, and there found the genial wife of the proprietor, preparing our bacon and eggs, ordered the night previous, and we had not long to wait before the pilot made his appearance, and we put him through the same initiation. A good breakfast over, we hastened to the *Americus*, and in a jiffy all was put aright and we were off.

I shall never forget that day! As the dainty little *Americus* glided on and out through the bay, the pilot, Mr. Norledge and myself, as if by the same sentiment, sat speechless and drank in the soft sea air and the grandeur of it all, and truly no men were ever nearer to their Creator, for we were thankful that we were sportsmen.

On shot the little craft and soon we had gone the full length of Jamaica Bay, and before us we could plainly see the broad expanse of ocean with its heavy swells, and we had but to plow our way through the turbulent waters, where the peaceful Jamaica Bay joins the Atlantic, and we were in the ocean.

Up to this time hardly a word had been spoken, and

KHAMA RIGGED AS A YAWL.

KHAMA RIGGED AS A CUTTER.

as we shot through the seas and felt the swells of the ocean, we began to realize that our task was not an ordinary one, by any means. The continual hum from the little engine and the sharp reports of the exhaust, told us that the little craft was as true as steel, and was doing her part to give us a safe and enjoyable cruise.

We kept the log, of course, and, if you like, I will quote from that, for you can then know the depth of the waters and will be able to take this trip yourself, should you desire.

After leaving Jamaica Bay we headed off shore for about three knots, and then sailed due E. The water along the coast has an average depth of 9 fathoms, which is ample of course. We passed the Rockaway Life Saving Station, and could plainly see several of the men in charge of the station, watching us, and one of whom had a glass. This was so with every life saving station we passed, and the Long Beach Station, reported to the Herald, "A queer, small craft passed here, bound E., at 9:43 A. M., carrying blue pennant with white hatchet, and white pennant with letter 'A'."

We seemed to be a source of wonder and amusement to Uncle Sam's life savers, and, no doubt, they thought

that they were in for it and would have an opportunity of trying their skill on the crew of the *Americus*, but not so.

Directly south of Shelter Island and Shelter Island Inlet, we passed a red, whistling buoy, and found that we were in 10 1/4 fathoms of water. This buoy we passed to the right or, if you prefer, we left the buoy on our port hand. Three and a half miles due E. we again passed a similar buoy in 11 fathoms of water. After passing this last buoy, we altered our course and steered N.E., and after a run of 5 1/2 miles, we sighted the bell buoy off Jones' Inlet. A good, stiff breeze had now sprung up and we began to feel our little craft rocking merrily on the waters of the Atlantic, and soon by her excellent behavior, we unanimously agreed that the *Americus* was a little queen, and a match for the element, and we settled down to plan our course through the Inlet.

Passing the bell buoy to starboard, we could plainly see the grim outline of a large tramp steamer, beached and a total wreck off the point, and about 1/2 mile S.W. of the Short Beach Life Saving Station. Here we met our first mishap. The pilot and Mr. Norledge were busily engaged in a discussion regarding the cause of

wreck of the British tramp, when suddenly we felt a jar and the engines began to double their speed and we were not moving. Only a moment was necessary to decide what caused the accident; a large piece of heavy timber floated by and our wheel had struck it and loosened it, and there was no further resistance in the water, and hence our little engines were putting up a merry pace.

The pilot advised us that he could adjust the wheel in no time, and with a large wrench, made his way to the stern and started in. Mr. Norledge and I agreed to use a pair of oars and keep the head up to the wind, thus giving the pilot a better chance. The pilot gave up in despair, after working in the water for nearly an hour, and informed us that we could do nothing but try and paddle our way through the Inlet. He also encouraged us by telling us that the weather was getting heavier every minute and we would have to try and get through the Inlet at once, and in the hope that we would find the waters of Great South Bay more calm, we commenced to paddle, with every thing on board which could be used for the purpose.

After about half an hour of this sort of thing, I concluded to try my hand with the wrench, and while Norledge and the pilot paddled I worked to set the jam nuts on the shaft, which would make fast the wheel again. A number of heavy swells broke over the stern and drenched me, but I stuck to the thing, and after a half hour of hard work and with the assistance of a leather washer I cut from the top of my shoe, I managed to set the wheel, and off we started again.

We could now see that the sea was breaking heavily on this point of land off the life saving station, and that the Inlet seemed a seething mass of foam and spray, and to tell you truly, I did not think the outlook very inviting.

We had planned to go through the Inlet, and through it we were going. Norledge and the pilot took the wheel, and with a life buoy by the side of each, were ready for the task. I unlaced my boots and placed a life buoy close beside me, and notified them that the "Engineer" was ready. The Americus seemed eager for the task, and we did not have long to wait. The pilot explained to us that every fourth comber was usually light, and that he proposed to ride in on the crest of every favorable one. I agreed, and we soon found our little craft on the very top of a crested breaker, and I would increase the speed on every such occasion, and the pilot would put the bow directly into the mountain of foam, and we would land some hundred or more feet nearer the more calm waters of the Great South Bay.

Again and again we repeated the same operation and the Americus really seemed to enjoy each new danger, and I can assure you the sport was exhilarating. We shipped several barrels of water, and Norledge kept the pump going, and in half an hour we had passed this inlet and had put in at Egg Island, where we refreshed and washed up for luncheon.

During the excitement, we had not forgotten to make our soundings and found that we had 4ft. of water, directly off the point, and by keeping in close to the inside shore of Short Beach, we found about 8ft. of water on an average. The pilot here took the upper channel leaving Deep Creek Meadows and Snipe Island on our port side, and we found that the lowest amount of water we had was 3ft., and from that amount to 17ft.

This was not the best course, as we afterward found, for there is a good channel with an 8-foot average of water, which is easily reached by steering a course due N. of the point on Short Beach, and leaving Deep Creek Meadows to starboard. After a repast of several kinds of sea fish and a big plate of clam chowder, and a good cigar, we were all eager to be on our way, and the Americus seemed as eager.

We hurriedly set out, and steering a course between Green and Low Islands, were soon in South Oyster Bay. The channels are very difficult to find all through the Great South Bay, and we had much difficulty from grass, which continually fouled our propeller and caused us no end of delays, for we were obliged to stop and clean the wheel many times. The channels lay close to the shore and directly off of Strong's Point, Fleet's Point, Conklin's Point, etc., and in the order named. The water at low tide is about 3ft. on an average all the way along this coast, and power boating is not as delightful as it might be in Great South Bay.

Next we passed Nicholls' Point, where we found a good, hard bottom, and about 10ft. of water in the channel. We steered a course due E. from this point and found that we had plenty of water and as much grass, but not nearly so difficult to navigate. Our log registered 8 miles from Nicholls' Point to Blue Point, and we then headed into the channel for Patchogue. Here we found a refreshing "snack" and some good cigars. We rested for half an hour, and then decided to set out again, and as every soul on board the Americus was an officer, we all smoked on duty and enjoyed our fragrant Havanas to the fullest extent.

The weather was very rough; and by this time the sky was cloudy and overcast, but we paid no attention to the weather, except to note that the barometer fell several degrees. The wind now and again would dash the foam from some breaking wave into our little craft, but we would only laugh and relight our cigars and enjoy the exhilarating situation.

We were soon off Howell's Point, and found about 7ft. of water in the channel, and thence we laid our course across Bellport Bay, which is grassy and very difficult to navigate. We were able to follow the channel here, for the life saving station, situated at Smith's Point, had marked the channel, so that they could be able to get supplies by boat from Patchogue.

From this point through Moriches Bay, we had to overcome innumerable difficulties, grass in particular, and very little water. The latter, at low tide, has only an average of about 3ft., and the extremely soft bottom makes poling slow and tedious. We persevered, however, and after traveling 9½ miles in this sort of water and mud, we arrived at Petunk Point.

There is an alleged canal or waterway connecting Moriches Bay at this point with Shinnecock Bay; we managed to get through this canal, and under an old abandoned bridge which crosses it, and once more found

ourselves in full view of a lighthouse and a short space of clear water. The channel here lies off the shore from Phillips' Point, and we steered a course due E. from this point to the Shinnecock Lighthouse, on Penquoque Point.

One of the life saving crew from the lighthouse at this point became very much interested in our craft and our trip and begged to go with us a part of our journey, offering to pilot us and aid us through Shinnecock, which we accepted, for our pilot had never been through the Great South Bay, nor had he ever sailed through Shinnecock.

We soon had our new pilot aboard, and after initiating him to a high ball and a good Havana, we set out again, and on the last stage of our cruise. Our new pilot had no difficulty in taking us around Cormorant Point, and to the hotel at Canoe Place, where we sent him to the railroad depot, and gave him a ticket back. He was delighted with the little craft and expressed himself in regard to her again and again, and wondered at her performance and the ease with which she could be handled in rough waters.

We were doomed to another disappointment. For after leaving the hotel at Canoe Place, we entered the new canal, connecting Shinnecock Bay with the Great Peconic Bay. In the canal we found a tide gate and a large sloop on the other side of the gate, and we learned from her captain that he had been waiting for two days for the water to open those gates. We were now doomed to spend some time, unless we could pry open, or in some way find means of getting around or through the gate. The captain of the sloop was in a bad temper and only laughed at our predicament, and evidently seemed happy in the thought that misery loves company.

It was now getting well along toward evening, and the sun's last rays were tipping the housetops in a quiet little village about a mile away. I had visions of spending the night there and not making the goal which we had set out to make and for which we had worked so hard. It seemed a shame, and I managed to get an ax and we were going to try and cut the gates loose and stand the damage in order to make our record good.

This we soon found was impracticable, so we set about to plan some way to get the Americus over the gates. She was not so heavy, and, with help enough, I was satisfied that we could pull her over the gates. I took out a bottle of Scotch and proceeded to get the captain of the sloop in proper form to help us, and to remove a look which was plainly evident came from disgust and an attack of that tired feeling. You would be surprised to know how quick a good cigar and a high-ball will put you right after a long, hard day's work—and the tired sportsman has generally had his share of the work.

Soon my disgruntled friend was in a better humor, and I proposed to him that we bring the sloop alongside, and that he put his boom over on my side of the gate as a sort of derrick; and that I would make slings of rope and we would hoist the Americus clear and put her on his side of the gate. He finally assented, and we set about making slings in which to hoist the little skimming dish, as she has been affectionately called ever since.

Soon all was in readiness and a dozen or more farmers and townspeople from the little village crowded around to watch. When all was in readiness, I took out our last box or cigars, and after supplying my curious friends, I invited each one of them to give us a hand, and soon we had about twenty sturdy men on to the ropes, and the tackle began to tighten and lo! the Americus left the water. It was but the work of a few minutes to swing her over on the other side of the gates, and after a division of the cigars remaining among my newly made friends, we again got aboard and soon the big sloop passed from view, in the distance and in the mantle of night which now was fast settling upon us.

We lit our port and starboard lights and settled down for a run of about 7 miles down Great Peconic Bay, the finest body of land-locked water in America, and the yachtsmen's paradise. I had telegraphed my man in charge of Craterdale to go to Red Cedar Point and hang a lantern on the point, so that I could find the way up the channel and to the front of the old farmhouse, where both the Americus and her tired crew would find shelter, food, and rest.

As if realizing that she had made a record day, the Americus eagerly plunged ahead and found little difficulty in making good speed on the less turbulent waters of Peconic. We had soon passed the 7 miles, so our taffrail log indicated, and I looked in vain for the light but to no avail; and on we went, until we were getting close to the town of Riverhead, the lights of which were now plainly visible and which meant that we had passed Craterdale some 9 miles.

A quick turn and soon we were on our way back, and when the log again registered the proper mileage, we used the whistle, and to our satisfaction, far over in the direction of Craterdale we could see a faint glow of a lantern and could see that it was being swung for our benefit, and in less time than it takes to tell you, we were alongside of the light and my man had arranged that he would fire three shots in rapid succession, which was to be taken at the house that we had been sighted and were coming in the channel and would be ready for a good supper.

The three shots were given, and we took our man aboard and started up the channel at half speed, for the hospitable old country house, where we, tired and hungry sportsmen, were to be well dined. Soon the little Americus drew alongside of the dock, and in a moment every tired seaman was at the table with a fine broiled spring chicken before him and a good bottle of claret, and I can assure you we did not stop eating except to discuss the trip. Next followed a big, home-made, blueberry pie and a cup of good coffee for each officer—and we were all officers, as I have before related—and then we drew around our chairs and each had a pipe and a good smoke.

An hour later a crew of tired sportsmen were slumbering on an equal number of feather beds, happy, content, and far away from the noise of a busy city, convinced that yachting was the king of outdoor sport. The little Americus remained in her berth at the dock,

the wonder and admiration of all who knew of her extraordinary cruise; and I can truly say that I would rather be a sportsman for a day, than the king of an empire forever!

## Y. R. A. of L. I. Sound.

THE March general meeting of the Yacht Racing Association of Long Island Sound was held at the Arena, No. 41 West 31st Street, New York City, on Monday, March 21, 1903. The following amendments to the racing rules were voted upon favorably:

Rule II. To strike out Section 1 and substitute the following: "Yachts shall be rated for classification and time allowance by racing measurement, which shall be determined by multiplying the length by the square root of the sail area, and dividing the product by 5.5 times the cube root of the displacement."

$$L \times \sqrt[3]{SA} = RM$$

$$5.5 \sqrt[3]{D}$$

Section 2. To strike out first line and substitute: "Length shall be ascertained by measuring the load water line length in a—"

To add a fourth paragraph to read as follows: "The load water line beam shall be measured at points one-eighth of the length of the load water line from its forward end and from its after end, and these measurements added. If this sum exceeds the maximum load water line beam, such excess is to be added to the load water line length. The result so obtained shall be the measurement of length."

To strike out Section 4.

To add the following to be numbered Section 4: "Displacement shall be ascertained by multiplying the area of the immersed midship section in square feet by 55 per cent. of the load water line length, the result being the measurement of the displacement in cubic feet."

To amend Section 6 by inserting the words "or remove" between the word "board" and "any" in the second line.

To strike out the second paragraph of Section 8.

Rule III. To reletter certain classes.—Referred to Executive Committee with power.

Section 2. To amend the first line to read "The restricted classes shall include only such yachts."

To strike out Section 3.

To add a new section to read as follows: "A yacht in a restricted class appearing alone in her class, may enter and compete in the relative sloop classes, provided that notice is given as specified in Section 3."

Add new section to Rule III: "A yacht availing herself of the privilege provided in Sec. 3, 4 and 5, must display on both sides of her mainsail, in addition to her regular racing number, the letter of the class in which she starts."

To strike out Section 6.

Rule XV. Section 1. To insert the words "in red" between the words "anchor" and "and."

To amend Section 2 by providing a starting signal for the knockabout class.

Rule XVIII. To amend the second sentence of Section 2 to read "The Committee boat at the finish line shall show a red ball, and after sundown shall show two red lights and at intervals the club's night signal."

Section 3. To substitute the words "flag N of the code" for the words "a mark ball" in the third and fourth lines.

Rule XIX. Section 1. To strike out the words "a red ball hoisted under flag B" in the second line and substitute "flag Y."

Section 2. Substitute flag "Q" for flag "B."

Restricted Classes: To change the title of the 18-foot restricted class to the 18-foot knockabout class.

Table of Scantlings: To strike out the columns applying to the 25-foot and 21-foot classes and change the headings of the remaining columns to apply to the 32-foot, 27-foot and 15-foot restricted classes.

Code Signals left with Executive Committee with power. Voted that code signals in colors be printed in book of rules, 1904.

The following officers were unanimously elected: Thos. H. Macdonald, President; Chas. E. Tower, Secretary; E. M. MacLellan, Treasurer.

Executive Committee—Frank B. Jones, Robt C. Mitchell, Chas. T. Pierce, Clinton H. Crane.

Requested that Regatta Committees advise all owners of racing yachts to send their measurement certificates to their club measurer, for the purpose of having same corrected, so as to show the measurement under the new rule and thus avoid confusion which otherwise will result from delay in doing this.

The racing schedule for 1904 is as follows:

Saturday, May 28—New Rochelle Special.  
Monday, May 30—Harlem Annual, Bridgeport Special; Indian Harbor Special.  
Saturday, June 4—Knickerbocker Annual.  
Saturday, June 11—Manhasset Bay Annual.  
Saturday, June 25—Seawanhaka Annual, New York; Athletic Special.  
Friday, July 1—American Annual.  
Saturday, July 2—New Rochelle Annual.  
Monday, July 4—Hartford Annual.  
Saturday, July 9—Riverside Annual.  
Monday, July 11—Manhasset Bay Cup Race.  
Tuesday, July 12—Manhasset Bay Cup Race.  
Wednesday, July 13—Manhasset Bay Cup Race.  
Saturday, July 23—Hartford Special.  
Saturday, July 30—Indian Harbor Annual.  
Saturday, Aug. 6—Hempstead Harbor Annual Shelter Island Annual.  
Saturday, Aug. 13—Horseshoe Harbor Annual, Bridgeport Annual.  
Saturday, Aug. 20—Huguenot Annual; Northport Annual; Hartford Special.  
Saturday, Aug. 27—Huntington Annual; Corinthian Stamford Annual.  
Saturday, Sept. 3—Indian Harbor Fall; Hartford Special.  
Monday, Sept. 5—Norwalk Annual, Sachem's Head Annual.  
Saturday, Sept. 10—Seawanhaka Fall.  
Saturday, Sept. 17—Manhasset Bay Fall.  
Saturday, Sept. 24—Riverside Fall.

### Katrina and Venus.

TERMINAL, Cal.—*Editor Forest and Stream:* Katrina was designed by Mr. J. H. Holmes, an amateur of the Humber Yawl Club, England. I used the plans as published in *FOREST AND STREAM*, making a few changes, which I thought would be better for the local conditions, and they proved to be about right.

The draft I increased 5 in., using 2,500 pounds of iron outside. Her original rig was that of a knockabout with the forestay leading to the stemhead, but in the first season she had a short bowsprit of 3 ft., and in 1893 it was increased to 5 ft. She had about 500 ft. of sail in jib and mainsail; were I building to that model again I would step the mast about one foot further forward, as she always had considerable weather helm, but was much improved after the changes were made in her headsail.

For a sea boat her equal would be hard to find; in that size her good freeboard, moderate overhangs, and compact sail plan gave me just the boat that I wanted, and I only sold her in order that I could build one larger which would give me more room on a cruise. You can see by looking at the charts that our cruises are all deep water and off shore, and are of quite a

Venus.

different kind than those indulged in by our eastern friends, and I well know whereof I speak, having been born and brought up in the east.

Our favorite ground is around Catalina Island, lying off shore some 25 miles. The South Coast Y. C. goes there on the Fourth of July, which, so far, is the only cruise that they have taken as a body, except one to Ocean Park, some 30 miles up the coast where we went to race for a cup, put up by the Country Club of that place, and managed to bring it home with the Venus, which was not very hard, seeing that none but our club boats were entered.

Earlier in the summer we made a cruise to Santa Barbara, everyone talked of going but only five boats made a start (the smallest turned back, finding it too rough), but the others had a very fine trip, although it was a little sloppy for the two smallest of those going through, Venus and Katrina. On this trip—my wife being along—we accepted an invitation from Mr. H. H. Sinclair to accompany him on his schooner Lurline, which he had just bought from Mr. John D. Spreckels, of San Francisco, making a cruise to Honolulu and Japan in Lurline. I sent the Katrina up with a couple of boys, and the Venus went up with her owner, Commodore Pease and a party of friends. The Venus has never been beaten since she was launched, but I expect to go down this summer before a new boat, built by Mr. Joseph Fellows; and as he designed and built the Venus, he feels certain that in the new boat he has worked an improvement. Whether he has or has not, time alone will tell, and Mr. Pease, who is now ex-commodore, is certain to make a good fight before he acknowledges defeat.

As a club, we are out for the Lipton cup, given by Sir Thomas to the Corinthians of San Diego. We hope to make a strong bid for it this summer, and if we don't bring it back it will be because they have a better boat or better sailors, which as yet we are not willing to concede.

JOSEPH T. PUGH.

### YACHTING NEWS NOTES.

#### Yacht Milwaukee is Awarded Cup.

After waiting for two years and a half, the owners of Milwaukee, which boat, on Aug. 17, 1901, won the special prize offered for competition between 35-footers by the Chicago Y. C., have been rewarded by the receipt of the handsome cup, accompanied by a letter from the committee to whom was referred a protest which resulted in the long delay in making the award. The cup is now in the possession of Mr. Robert Nunnemacher, chairman of the Milwaukee syndicate which built the yacht Milwaukee in 1901 to compete in the trials for the selection of a defender of the Canada's cup, which Invader won at Chicago in August of the same year by defeating Cadillac, the Detroit craft selected by the committee to meet the Toronto yacht.

Milwaukee was not successful in the trials, but out of courtesy to the yachtsmen who had brought yachts to Chicago to compete in the preliminary contests prior to the real thing for the Canada's cup, the Chicago Y. C. offered a trophy for special race after the cup races were finished, and Mr. Nunnemacher entered the craft which Chicago yachting writers dubbed the "sidewalk." The day of the special race was set for Aug. 17, 1901, the entries being Milwaukee, Illinois and Yankee. In a whole sail breeze the Jones & Laborde creation led the other 35-footers around the Chicago Y. C.'s 15-mile course on the day of the contest. Milwaukee ran away from Illinois, and Yankee was hardly a competitor after the first leg of the course had been sailed. Milwaukee carried her new centerboard, which was 14 in. deeper than its predecessors, and 1,350 sq. ft. of canvas under

a double reef. In the race she almost caught up to the 52-footers, in spite of her 8-minute handicap.

Immediately after the race, Mr. George Pynchon, of Illinois, entered a protest against Milwaukee, and in sending the cup to Mr. Nunnemacher, who is the chairman of the Milwaukee syndicate, Chairman Robert Thorne, of the regatta committee of the Chicago Y. C., addressed the following letter to Mr. Nunnemacher, which is self explanatory:

Chicago, March 7, 1901.

Mr. Robert Nunnemacher, Chairman Milwaukee Syndicate, Milwaukee, Wis.:

Dear Sir—In the matter of the protest filed by Mr. George Pynchon against the yacht Milwaukee, the winner of a race held under the auspices of the Chicago Yacht Club, Aug. 17, 1901, the regatta committee renders the following decision: "At the time of the protest some doubt existed in the minds of the regatta committee as to the proper manner in which to measure the girth of the Milwaukee, and the matter was therefore referred to the council of the Yacht Racing Union of the Great Lakes, who ruled that 'if a hollow is formed in the water line profile, such hollow shall be filled up by drawing a straight line from the lower extremity of the centerboard and extended forward to waterline mark, and girth taken at that line.' Immediately after the race the Milwaukee went out of commission, and it was impossible for the regatta committee to re-measure the boat. However, Article 4 of the racing rules of the Yacht Racing Union provided that 'measurers may accept for the measurement of the girth the designers' written certificate or drawing, certified to as being correct by designer and builder.' With the measurements we had, together with this written certificate, we find that, according to the ruling of the council, that the Milwaukee measured 34.60 feet on the day of the race. We therefore overruled the protest and award the prize to the Milwaukee. We greatly regret the delay in our decision; but it took a long time for us to secure the ruling of the council of the Yacht Racing Union, and in the meantime our committee's duties had expired and the matter was inadvertently overlooked."

The cup has been this day shipped to Mr. Nunnemacher at Milwaukee. Very respectfully,

The Regatta Committee C. Y. C. for 1901.

Robert Thorne, Chairman.

Milwaukee will be placed in commission again this year by Mr. Nunnemacher, who hopes to arrange for another series of races during the season with Illinois, which is now owned by Mr. Joseph Uihlein, of Milwaukee. Mr. Nunnemacher is enthusiastic over Milwaukee as a result of a trial he made against the speed of Invader and Cadillac at Chicago on Aug. 14, 1901, the day of the final race between the American defender and Canadian challenger. On that day he got Milwaukee under way 4 minutes after Invader and Cadillac got the gun, and finished 7 minutes sooner than Invader, a net gain of 11 minutes.

A. W. FRIESE.

MILWAUKEE, March 19.

#### California Y. C. Fixes

The regatta committee of the California Y. C. has issued the following programme:

May.—Saturday, 7th, opening; Sunday, 8th, cruise in squadron; Saturday, 14th, open; Sunday, 15th, open; Saturday, 21st, open; Sunday, 22d, handicap race; Saturday, 28th, cruise to Benicia; Sunday, 29th, special orders; Monday, 30th, special orders.

June.—Saturday, 4th, open; Sunday, 5th, open; Saturday, 11th, open; Sunday, 12th, open; Saturday, 18th, open; Sunday, 19th, class flag regatta and owners' cup race; Saturday, 25th, open; Sunday, 26th, open.

July.—Saturday, 2d, cruise to San Mateo Point; Sun-

Katrina.

day, 3d, clambake, San Mateo Point; Monday, 4th, return from San Mateo Point; Saturday, 9th, open; Sunday, 10th, Wallace trophy race; Saturday, 16th, open; Sunday, 17th, open; Saturday, 23d, up river cruise; Sunday, 24th, up river cruise; Saturday, 30th, up river cruise; Sunday, 31st, up river cruise.

August.—Saturday, 6th, cruise to Sheep Island; Sunday, 7th, fish chowder, Sheep Island; Saturday, 13th, open; Sunday, 14th, open; Saturday, 20th, cruise to California City; Sunday, 21st, cruise to California City; Saturday, 27th, open; Sunday, 28th, race for 20 ft. class.

September.—Saturday, 3d, cruise to Petaluma Creek; Sunday, 4th, cruise to Petaluma Creek; Monday, 5th, Labor Day Cruise; Friday, 9th, Admission Day, Pacific interclub regatta; Saturday, 10th, open; Sunday, 11th, open; Saturday, 17th, open; Sunday, 18th, open; Saturday, 24th, open; Sunday, 25th, race for 20 ft. class.

October.—Saturday, 1st, open; Sunday, 2d, Vincent handicap regatta; Saturday, 8th, open; Sunday, 9th, open; Saturday, 15th, rendezvous at Sausalito; Sunday, 16th, cruise outside; Saturday, 22d, open; Sunday, 23d, open; Saturday, 29th, closing day; Sunday, 30th, cruise in squadron.

#### Harbor at Cape May.

Mr. T. Alfred Vernon, secretary of the Atlantic Y. C.

has sent Mr. Theodore E. Burton, chairman of the Committee on Rivers and Harbors, House of Representatives, Washington, the following letter in regard to a proposed harbor of refuge at Cape May:

The members of the Atlantic Y. C. regard with great interest and satisfaction the proposed action of the Government, under pending legislation in Congress, of providing to make available a harbor of refuge, on the now almost harborless coast of New Jersey, at Cape May, N. J., and thus establish what we regard as most desirable and of absolute necessity in the way of assuring the safety of our large and increasing fleet of pleasure vessels, as well as for the mercantile marine, along the coast.

They have long been impressed with the great need of a harbor

Venus.

on the New Jersey coast, of a place of refuge between here and the Capes, and now express our sincere approval of the project under way to meet this need, by the harbor at Cape May, and sincerely petition your honorable body to report favorably on this proposed legislation that this important work may be taken in hand at an early date.

#### Two New Speed Launches.

Two speed launches are being built at the Lozier shops, at Westchester. One of the boats was designed by M. Ferguson. She is 37 ft. 1 in. over all; 33 ft. waterline; 4 ft. 5 in. breadth; and 8 in. draft. Her power will consist of a 30 horse-power motor. The second boat is from designs by Mr. Henry J. Gielow. This craft is 26 ft. 3 in. over all; 25 ft. 3 in. waterline; and 4 ft. 4 in. breadth.

#### New Launch for T. L. Park.

The Huntington Mfg. Co., of New Rochelle, is building a 41 ft. launch, from designs by Mr. E. V. Willis, for Mr. Trenor L. Park. The boat is 41 ft. waterline, 10 ft. breadth, and will be fitted with a 70 horse-power engine. Two other launches are being built at this yard. The larger of the two is 35 ft. long and was designed by Mr. R. N. Bavie. She will be fitted with a 15 horse-power Standard engine. The other launch is for Mr. Daniel S. Morrel, of Hartford, Conn. This boat will have a 24 horse-power motor installed. Twelve sailing dories are being completed for members of the Corinthian Y. C., of Philadelphia. These boats are 21 ft. over all, and 6 ft. breadth.

#### Larchmont Y. C. Fixtures.

The spring regatta of the Larchmont Y. C. will be sailed on Saturday, June 18, and the annual regatta on July 4. Race week will begin on Saturday, July 16, and end on Saturday, July 23.

#### Redwing Sold.

Mr. J. B. O'Donohue, of the Atlantic Y. C., has purchased the Bar Harbor 30-footer Redwing.

#### Steam Yacht Cangarda Sold.

Mr. Charles J. Canfield, of Manistee, Mich., has sold the steam yacht Cangarda to Mr. Willis T. Hanson, of Schenectady, N. Y., through the agency of Messrs. Gardner & Cox.

#### New Boats from W. H. Hand's Designs.

Mr. W. H. Hand, Jr., of New Bedford, has finished the lines of a 21 ft. racer for H. L. Chamberlin, of Buffalo, a 22-rater for Mr. D. D. Allerton, of New York, under the Gravesend Bay Y. R. A. rule, and a restricted 15-footer for Mr. E. B. Green, of Buffalo, under rules similar to those of the Y. R. A. of Massachusetts.

#### Steam Yacht Geisha Sold.

The 80 ft. steam yacht Geisha has been sold by Mr. A. Bleecker Banks, through the agency of Mr. A. J. McIntosh, to Mr. Leonard Richards.

#### N. L. Skene Establishes Brokerage Business.

Mr. Norman L. Skene has established himself at 131 State street, Boston, Mass., where he will carry on a yacht brokerage business in connection with his designing work.

A. C. A. National Meet, Sugar Island, Thousand Islands, St. Lawrence River, August 5-19, 1904.

## The Log of the Iris.

BY J. N. STALKER, DETROIT, MICH.

(Continued from page 235)

When it came to a question of hotels, the LLD. looked at me gloomily and said nothing. I was smothering to relieve my system of a lot of sulphurous thoughts, but there was no discoverable recipient for them, so I, too, said nothing. After some explanations we got ourselves housed in the servants' quarters of a hotel; I first wringing out my clothes in a faraway bathroom, and resuming them, wet and horrible, for the trip to our apartment. It was then about ten o'clock, and for various other reasons we waived supper and went to bed with a good appetite for breakfast. Soothed by the drip, drip, of my garments I was soon wrapped in slumber's soft embrace from which I emerged to find them still dripping, festooned picturesquely around the chamber, and a little pool of water under each. There was no choice, so they went on again, wet and cold, and after breakfast and a liberal fortification of the system on my part we were on our way.

We had an interesting but uneventful ride up the majestic Detroit River from Wyandotte to Detroit, past the almost continuous succession of tall chimneys and big factories below the town, and long river frontage of the big city. We decided to stop at the latter place over night and give the present scribe a chance to dry out.

The white caps were rolling merrily the next morning, but the wind was favorable so we put up our sail and set off at a clipping pace. Once we had passed the world-famous Belle Isle and gotten out into Lake St. Clair, it became decidedly rough, so rough, as we subsequently learned, that no fishing from the broad heavy fishing boats was attempted all day. Perhaps the fishing would have been no good anyway, I am not enough of an authority to say, but at any rate we had the most exciting sailing I have ever enjoyed. Running pretty much before the wind, we fairly tore along, now rushed ahead on the white crest of a wave for a minute at a time, then finally outstripped by it, dropping into the trough until caught up and hurled forward by the next, which broke over the covered deck and generally landed a half pailful of water between the steersman's shoulders.

Steering under those conditions was one of the most strenuous occupations I ever undertook. When the stern of the boat was heaved up into the air, by a wave just about to pass under us, it took every ounce of strength we possessed, applied to the long single paddle to keep her straight, and then a minute later when the wind caught her bow it was almost as bad. Although we did not readily tire paddling, we were obliged to change places pretty often that day, and I never got so many and such appalling aches in my life, as fell to my lot as the result of steering that little canoe. The lee-boards of inch ash, and strongly braced with iron, were literally wrenched to pieces before we had been gone an hour, so we unstrapped them from the thwart, threw them overboard and went on without them. We sailed the whole morning in this fashion, passing headland after headland in one continuous rush, and getting wetter and wetter all the time.

By half-past two we were shipping so much water that we were kept busy to bail it out as fast as it came in. We were sitting in from two to three inches of it all the time, and were soaked to the skin from head to foot, but sublimely happy, nevertheless. Chancing to look around, however, we saw a big black thunderstorm approaching, so that all things considered we decided to make for shelter. There were a couple of boat-houses near at hand, but the doors were of course shut, so that we could not run in, and we dared not land near them for fear of being smashed to splinters against the wooden wall which ran along the shore, and curbed the wandering tendencies of the land.

We were accordingly obliged to continue on to where there was a beach, at which place, in order to avoid accident to the boat in the really considerable surf, we jumped overboard and ran her up in regular life-saving crew style. The LLD. now showed an intelligence which did him credit. As soon as we had got our sail down, without waiting to decide the matter by discussion, whereat he would have been worsted, he shoved me off again a prey to the elements, and went away himself to get a boat-house door open. I struggled manfully out there in the wet, paddling furiously without seeming to make much headway and eyeing the approaching storm with great dislike. I got the boat safely into a boat-house before the storm broke, however, and we went up to a farm-house to wait, the LLD. soothing me with a fabulous tale about the difficulties he had encountered in getting the place opened up. As I did not believe any of the tale I will not repeat it.

The minds of the farm-house people had been somewhat prepared for our arrival by my companion, so that considering our horribly water-logged condition, they welcomed us as warmly as we could expect. The family consisted of an ex-day-laborer from Detroit, his bare-footed wife, and a bare-footed young lady whom we took to be his daughter. The latter coyly sat on her feet while we passed through the kitchen, then sized us up

through a crack in the door, and that was about the extent of our acquaintance with her. We had barely got inside when the rain came down in torrents, and did not stop until after dark, so we were very glad we were under shelter. We sat down, dripping as we were, to the most villainous meal, with the exception of next morning's breakfast, that I have ever been up against, and as to our sleeping accommodations that night—I decline to describe them.

The next morning we climbed into the mess of water-soaked carpet, cushions, tent, and provisions that we found in our boat; by half-past eight we had reached the mouth of the Clinton river, and after a leisurely eight mile paddle up the pretty little stream came to the city of Mt. Clemens. We spent the rest of the morning drying out our stuff and ourselves by spreading the whole aggregation picturesquely along the shore in the sun. In the afternoon, in the process of seeing the town, I imbibed in my ignorance a whole tumbler of raw, undiluted mineral water, thereby greatly astonishing the Mt. Clemensite who gave it to me in the expectation that I would not want more than a sip. In fact, I did not, but drank it anyway. However, I shortly began to turn a ghastly green, and found myself under the necessity of retiring to a secluded spot, where I proved myself an inhabitant of the space of four dimensions by turning completely inside out. I would not mention this sad occurrence but that it explains why we did not proceed until next morning.

The next day was a very enjoyable one spent in exploring the Clinton River way up past the town. We went up twelve or fifteen miles before lunch and back again in the afternoon, and found it very pretty indeed—not quite so wild as the Huron, but with a certain quiet beauty of its own. After supper we fairly surpassed ourselves in the eight mile paddle down to the club-house at the mouth of the river where we passed the night. The moving consideration was a huge black thunderstorm which came up behind us directly we left town. Expecting momentarily to be deluged, we tore down the river for those eight long miles at the very top of our speed, and succeeded in getting to our destination ahead of the storm, albeit dripping with perspiration and pretty thoroughly blown. The reader may now attempt to imagine our nausea when I tell him that the whole thing blew over without raining a drop. Even suitable thoughts failed us.

The next day, the Fourth of July, by the way, was positively ideal. Early in the morning we started straight out into the lake in the direction of St. Clair Flats, feeling just like miniature Columbuses as we steered our little craft into the open lake. There is certainly an exhilaration about venturing into the "unknown," so to speak. Although we had a pretty definite notion where the flats as a whole were to be found, we didn't have much idea what part of them we would strike, or when it would be, steering as we did by the sun, and pretty much at the mercy of the wind and current. Besides, I shall have to plead guilty to the charge of pretending to myself that I was as ignorant of the blue waters surrounding us as the first aborigine that ever trod their shores. It was more fun doing it that way, that was all. We often did it.

Before long, we saw the scattered trees and long lines of rushes that mark the flats, and were soon grappling with the problem of navigating through that wonderful maze of islands, rushes and channels. We were finally led by the course of events for about two miles up what seemed to be a long channel, but which turned out to be a bay when we got to the end of it. This was on the face of it a very distressing circumstance, but luck was with us, and ten minutes of profitable exploration revealed a spot where a couple of inches of water covered the land as far as the next channel. Over this mud accordingly, with a good deal of force and coaxing we finally wriggled the boat into deep water again. Not far from here we came across a little summer hotel where we discovered where we were and where we wanted to go, after which we had no trouble. I was amazed at the great area of the flats, though; the ordinary traveler forms no adequate conception of them.

Before long a big catboat that had been out after muscalonge overtook us and offered a tow, which we promptly accepted. It is magnificent, when away like that, to do it all yourself, but it is not common sense. The man who offered the tow was not foolish, either, as he was the proprietor of a little hotel not far away whither he towed us, and once there we were easily induced to stay to dinner.

That important function satisfactorily terminated, we found ourselves temporarily incapacitated for further exertion, and were accordingly granted a further tow of four miles to Pearl Beach behind the proprietor's naphtha launch. Here, the distaste for work having by this time reached large proportions, we hoisted the sail and let the wind do the rest, reclining luxuriously in the bottom of the boat and smoking some of our late host's excellent cigars. Up that picturesque shore, with its miles of summer cottages, we were wafted lazily along, the water just rippling pleasantly against the bow, in as perfect contentment of mind and body as it would be possible to be. At every row and sail-boat we saw, and

there were many of them out for pleasure that afternoon, the thought came to us how tame their fun was, with the necessity before them of traveling in the old familiar waters and returning from each ride to the old familiar starting point. With us it was so different; we simply kept on and on, seeing new things and enjoying them every mile until we got tired; then a cheerful camp and a fresh start the next day.

At the city of Algonac we stopped for our first mail but were unable to get it as the post office was celebrating the Fourth. We accordingly determined to take a little side trip on the Snicardy, about whose beauty we had heard much, then go up the Sydenham River as far as we cared to, after which we would return for our mail when the times were more propitious. The Snicardy River, which is simply another outlet for the St. Clair River, separating the Indian Reservation of Walpole Island from the mainland, we found quite up to expectations, although for the canoeist it lacks the fascination of a little stream without possessing the compensating largeness and majesty of a big one. We had supposed that the Snicardy was tributary to the St. Clair, instead of being an outlet of it, and having been warned of its swift current, toiled along very wearily, condemning the head wind and feeling rather sorry for ourselves.

After a number of such laborious miles, however, we noticed that the current seemed to be going the wrong way. When this observation was confirmed, the truth dawned upon us that we were going *with* the current and we went along very much more easily.

A couple of fair camping grounds on Walpole Island were passed up, because of an alleged desire (a totally insane one, by the way) on the part of the LLD., to reach the Sydenham River that night. The actual cause of this desire was, in my opinion, the belief that we would be unscathed, and our "valuables" taken by stealthy Indians that night, if we ventured on or near Walpole. However, in any case, he is clearly to blame for all that follows. Naturally, when, tired and very supperless, we reached the river aforesaid, there was no camping ground to be found; the place was wet, marshy, and alive with mosquitoes. Until dark we poked sadly up and down that neighborhood, until finally, in sheer desperation, we were compelled by the approaching darkness to take the first place we came to. The grass was tall and wet, and there was an ominous buzzing in the air, but we landed and set about pitching our tent, which was, of course, the first essential.

We had considerable difficulty here, because material for pegs was scarce, and we were obliged to do all our work with one hand while we slapped at mosquitoes with the other. When the tent was finally up, it was quite dark and too late to think of getting supper, though our appetites were such that we remember them to this day with distress. Before we had time to stow things comfortably away, it began to rain, so we crawled into the tent, accompanied by a horde of mosquitoes from all the surrounding region, who also wanted to keep dry.

We had had recommended to us a preparation of pennyroyal and tar as a defense against these pests, but the stuff was put up under the direction of the LLD. so that the vaseline, a very essential ingredient, was omitted. We applied the stuff very liberally, however, but alas! we had not reckoned with our skin, which was raw with sunburn, so that the turpentine in it soon began to feel like so much fire. And to cheer us still further the mosquitoes seemed to like the mixture prodigiously, and settled down on it like flies! One might imagine that the situation was intense enough as it was, but in addition, the tent, besides leaking, was like a Turkish bath for heat, so that as we slapped and wriggled under the influence of the mosquitoes, we fairly melted away into perspiration, and were unable to wrap our heads in our coats, as a protection, without danger of suffocating.

Matters having fully developed we settled down to enjoy the mosquitoes, and such mosquitoes! They apparently, despite their ample physical development, had not had a meal for months, and I can testify that they will not need another for years. It was simply slap, slap, minute by minute while the hours passed slowly by, and while we were slapping one spot we could feel about a dozen stings going through our burning skins in other places. We thought longingly of our cigars, off somewhere in the canoe in the midst of all our stores, but we were afraid to go wading through the wet after them for fear of further angering our guests.

The limit of human endurance finally seemed to be reached, and I was at last driven to crawl out into the deluge on a hunt for cigars, where somewhat to my surprise, after four or five minutes' strenuous search, I found them. After we had got the place pretty full of smoke we were troubled much less, but it was necessary to keep on producing smoke incessantly, as the draft which blew through the tent, both ends of which were, of course, open, seemed especially ordained for the benefit of the mosquitoes. In consequence we smoked alternately, the LLD. and myself, without a stop, until daybreak. The cigars were none of the best and our stomachs were empty, so that naturally we sickened awfully before morning, but we dared not stop.

About 4 A.M., the rain having stopped, we crawled out in a very pessimistic frame of mind, to face the breakfast

problem. On account of the number and quality of the cigars consumed, we had no appetites, but knew we ought to have. All available wood had, of course, been out all night and was soaked through, but by chopping away the outside of a log we got some chips which were merely damp, and with them we set to work. After over an hour of unremitting attention, and five unsuccessful attempts, we had a fire which could stand the strain of wet fuel without going out. Then a rather unenthusiastic breakfast, part of it in a drizzle of rain, and all of it in the mud, and we set off languidly up the Sydenham River, feeling as if our mainsprings were gone, and still thinking occasionally of home and mother.

We found the river very muddy, flat, and uninteresting, and distinguished chiefly by the utter absence of paint on the houses along its shores. We arrived at Wallaceburg just about dinner time, having spent most of the morning under a shed watching the rain. After dinner we took a vote whereby it appeared that that portion of the British Empire possessed no further attractions for us. We accordingly paddled our fifteen miles back to Algonac that afternoon, against a strong head wind all the way. We had encountered a strong head wind going the opposite direction the day before, and had hoped for an easy time returning, but this seemed to be our yellow day all around.

[TO BE CONTINUED.]

### A. C. A. Membership.

The following have been proposed for membership in the A. C. A.: Charles F. Langnecker, New Brighton, Pa.; Robert W. Allen, Kenosha, Wis.; Augustus S. Wright, Lowell, Mass.; G. B. Proud, Manchester, N. H.; Ralph W. Richardson, Newton, Mass.; Walter E. Foster, P. W. Shephard, Wm. S. Power, David H. Boyd, John M. Irwin, Richard Owen, Karl V. Myler, and A. G. Parsons, all of Pittsburg, Pa.; Wyn B. Morris, Willkingsburg, Pa. Mrs. Charles P. Forbush, Buffalo, N. Y. (for associate membership).

### Editor Forest and Stream:

I beg herewith to inform you that the following have been transferred from active to life members of the American Canoe Association, in accordance with Sec. 2 of Art. I. of by-laws:

1903—Nov. 24: Samuel Hoffman, Morristown, N. J.  
1904—Jan. 29: Frank C. Hoyt, care McLellan, Boody & Co., New York.

March 4: Morton V. Brokaw, 95 William street, New York; A. S. Mitchell, 113 Devonshire street, Boston, Mass.; Percy F. Hogan, 242 Pearl street, New York.

March 12: George H. Voss, Ellicott Square, Buffalo, N. Y.

ROBERT J. WILKIN,  
Pres. Board of Governors, A. C. A.

### CANOEING NEWS NOTES.

#### Atlantic Division Dinner.

The annual dinner of the Atlantic Division of the A. C. A. was held at the Arena, West Thirty-first Street, New York City, on Saturday evening, March 12.

There were in attendance eighty-seven members, who were well entertained by Commodore C. F. Wolters and John S. Wright, of Rochester, N. Y.; also by W. P. Stephens, C. B. Vaux, Chas. L. Norton, and Robert J. Wilkin, member Board of Governors. Vice-Commodore L. C. Kretzmer called particular attention to the Atlantic Division meet, May 28-30, on the Hudson River, opposite Riverdale station of the N. Y. C. & H. R. R. R.

The affair was pronounced a grand success, in bringing together so many enthusiasts of the paddle.

The menu was a very attractive souvenir of the occasion:

#### MENU.

Olives	Buzzards Bays	
North Carolina Shad au four	Potage Henriot	Radishes
Larded Tenderloin of Beef aux cepes	Celery	
Catalane	Potato Croquettes	
	Haricot verts	Grilled Tomatoes
Ruddy Duck, Roasted	Sorbet	
Fancy Ice Cream	Salade de Saison	Fried Hominy
	Cheese	Assorted Fruit
	Café Noir	

#### Yapewi Aquatic Club.

At the annual meeting of the Yapewi Aquatic Club, of Bordentown, N. J., held in March, the following officers were elected: President, Richard Woodward; Vice-President, Elmer B. Ayres; Purser, Charles E. Burr; Secretary, J. Bert. Reynolds; Captain, Charles S. Osmond; Mate, Charles A. Tyler; Board of Directors, Harry C. Ford, George W. Swift, Frederic W. Taylor, Dr. Wm. Kester, George Anderson.

#### Shattemuc Yacht and Canoe Club.

Commodore Franklin Brandreth, of the Shattemuc Yacht and Canoe Club, has appointed Dr. Merritt W. Barnum Fleet Surgeon, and Louis H. Soule Fleet Captain of the club for the season of 1904.

## Rifle Range and Gallery.

#### New York Central Corps.

TWENTY-THREE members of the Central Corps were present in the Zettler gallery on March 16. Gute and Muller were first and second for high scores.

Ten-shot scores, 25-ring target, distance 75ft.: R. Gute 241, 247; H. D. Muller 240, 240; J. N. F. Siebs 243, 237; F. Kast 232, 239; B. Eusner 232, 233; C. Gerken 222, 238; G. A. Viemeister 230, 227; D. Scharninghaus 232, 222; W. Schillmann 223, 226; H. Schrader 223, 219; F. Engelken 222, 221; A. D. Ritterhoff 215, 220; A. Rode 222, 212; F. Schiller 206, 218; F. Schroeder 219, 204; John Koch 213, 208; Ch. Tietjen 205, 216; H. von der Lieth 217, 198; J. H. Speckman, Jr., 197, 211; H. A. Ficke 211, 189; J. Winter 184, 200; G. Dettloff 168, 200; J. von der Lieth 200, 167.

### The Independent New York Corps.

GUS ZIMMERMANN, as the captain and leader of the Independent Corps, is much pleased with the interest that is being shown by the members in the monthly shooting. Twenty members were present at the shoot on March 18. Capt. Zimmermann was first for the two best scores:

Ten-shot scores, 25-ring target, distance 75ft., the aggregate of two scores to count, possible 500: Gus Zimmermann 487, Aug. Begerow 482, L. Schmidt 477, F. Liegibel 477, Wm. Soll 475, L. C. Hauenstein, Jr., 473, Jac. Bittschier 472, E. Greiner 464, Geo. Zimmermann 460, Herman Kuhn 451, Jac. Schmid 450, B. Eusner 449, H. J. Behrens 437, F. A. Wittig 429, F. A. Young 427, H. Zimmer 427, H. Kabirski 407, E. Gartner 402, F. C. Halbe 400, A. Rodler 372.

#### Zettler Rifle Club.

THE members of the Zettler Club are hard at work in their weekly gallery contest for honors and high scores in the winter gallery shoot. On March 15 Louis C. Buss, the new champion of the late tournament, was high for the best 100 shots. Wm. A. Tewes seems to be in the lead for the best fifty scores to date.

Ten-shot scores, 25-ring target, distance 75ft., 100 shots: L. C. Buss 2453, Wm. A. Tewes 2444, L. P. Hansen 2432, H. Fenwirth 2357, Major A. Rowland 2324.

Fifty shots: Chas. Zettler, Jr., 1217, E. H. Van Zandt 1213, A. Moser 1208, B. Zettler 1204, W. A. Hicks 1203, Aug. Kronsberg 1205, Chas. G. Zettler, Sr., 1199, H. C. Zettler 1190, Aug. Begerow 1162, Thos. H. Keller, Sr., 1143.

### New York City Corps.

At the bi-monthly shoot of the City Corps in the Zettler gallery, March 17, Aug. Kronsberg was first for high scores.

Ten-shot scores, 25-ring target, distance 75ft.: Aug. Kronsberg 245, 240; R. Schwanemann 242, 238; O. Schwanemann 238, 240; R. Busse 241, 235; J. Facklamm 233, 235; C. Wagner 234, 232; B. Eusner 232, 232; R. Bendler 234, 222; H. C. Radloff 225, 216; J. Keller 214, 225; G. Schrotter 209, 212; H. C. Coplan 213, 223; E. Sonner 211, 212; F. Keller 208, 186; A. Wiltz 208, 177.

#### Rifle Notes.

The returns of the United States Revolver Association's revolver and pistol competition indicate that Mr. S. E. Sears and Dr. E. H. Kessler, both of St. Louis, are the winners, respectively, of the revolver and pistol championships. Mr. Sears' score was 477 out of a possible 500; Dr. Kessler's score is 450 out of 500.

## Trapshooting.

If you want your shoot to be announced here send a notice like the following:

#### Fixtures.

March 22-25.—Crawfordsville, Ind., Gun Club's tournament.  
March 19.—North Branch, N. J., merchandise target shoot.  
March 23-24.—Allentown, Pa.—Two-day target tournament at Duck Farm Hotel. C. F. Kramlich, Mgr.  
April 1.—Shingle House, Pa.—Owego Valley Rod and Gun Club seventh tournament. U. S. Dodge, Sec'y, Millport, Pa.  
April 1-2.—Newark, N. J.—Forester Gun Club tournament.  
April 2.—East Millstone, N. J., Gun Club merchandise and sweepstake shoot.  
April 6.—Sheepshead Bay, L. I.—Eastern amateur target championship, on grounds of Sheepshead Bay, L. I., Gun Club.  
April 6-7.—Bristol, Tenn.—The Interstate Association's tournament, under the auspices of the Bristol Gun Club. S. W. Rhea, Sec'y.  
April 7.—Bethlehem, Pa.—Lehigh Rod and Gun Club of the Bethlehem all-day target tournament. H. F. Koch, Sec'y.  
April 12-13.—Indianapolis, Ind.—Indiana League of Trapshooters' annual tournament.  
April 16.—Bound Brook, N. J., Gun Club all day target shoot; free silver prizes. Dr. J. B. Pardoe, Sec'y.  
April 18-22.—Kansas City, Mo.—J. F. Schmelzer & Son's Arms Co. fourth Interstate midwinter shooting tournament; targets and live birds.  
April 19.—Springfield, Mass.—Shooting Club Patriots' Day tournament. C. L. Kites, Sec'y.  
April 19.—Wellington, Mass.—All-day shoot of the Boston Shooting Association. O. R. Dickey, Mgr.  
April 19.—Haverhill, Mass., Gun Club's eighth annual Patriots' Day tournament. S. G. Miller, Sec'y.  
April 19-21.—Paducah, Ky., Gun Club's spring tournament. W. B. Kennedy, Sec'y.  
April 20-21.—Rensselaer, Ind., Gun Club amateur tournament. Everette Brown, Mgr., Pleasant Grove, Ind.  
April 21.—Easton, Pa.—The Independent Gun, Rifle and Pistol Club's first annual target tournament. Edw. F. Markley, Sec'y.  
April 26.—Greenville, O., Gun Club amateur tournament. H. A. McCaughey, Sec'y.  
\*April 26-27.—Pittsburg, Pa.—Herron Hill Gun Club.  
April 26-27.—Pittsburg, Pa.—Herron Hill Gun Club tournament. \$100 added. Louis Lautenslager, Mgr.  
April 26-29.—Kansas City.—Spring target tournament at Blue River Park. R. S. Elliott, Mgr.  
April 27-28.—Americus, Ga.—The Interstate Association's tournament, under the auspices of the Americus Gun Club. H. S. McCleskey, Sec'y.  
April 28.—Brunswick, Me., Gun Club's Fast Day shoot. G. M. Wheeler, Sec'y.  
May 3-4.—Wabash, Ind., Gun Club tournament.  
\*May 3-4.—Derry, Pa., Rod and Gun Club.  
May 3-5.—Junction City, Kans.—Kansas State Sportsmen's Association annual tournament. E. L. Wetzig, Sec'y.  
May 4-5.—Rochester, N. Y., Rod and Gun Club spring tournament.  
May 4-5.—Nashville, Tenn.—The Interstate Association's tournament, under the auspices of the Cumberland Park Driving Club. Charles Eastman, Sec'y.  
May 11-12.—Springfield, O., Gun Club's target tournament. Geo. Morgan, Sec'y.  
May 11-13.—Spirit Lake, Ia.—Iowa State Sportsmen's Association tournament. J. Burmister, Sec'y.  
May 12-13.—Wilmington, Del.—Wawaset Gun Club annual spring tournament. W. W. Foord, Sec'y.  
May 16-18.—Southern Trapshooters' Association's thirteenth tournament at targets, under auspices of Vicksburg, Miss., Gun Club; \$500 added. J. J. Bradfield, Sec'y.  
May 16-21.—York, Pa.—Tournament of Pennsylvania State Sportsmen's Association, under auspices of York City Gun Club. N. M. McSherry, Sec'y.  
May 17-18.—Dubuque, Ia., Gun Club's fifth annual amateur target tournament. A. F. Heeb, Cor. Sec'y.  
May 17-18.—Dallas, Tex.—The Interstate Association's tournament, under the auspices of the Dallas Gun Club. E. A. Mosely, Sec'y.  
May 17-19.—Davenport, Ia.—Cumberland Gun Club's annual amateur tournament. W. F. Kroy, Sec'y.  
May 18.—Boston, Mass., Gun Club annual target shoot. H. Kirkwood, Sec'y, 23 Elm street, Boston.  
May 18-20.—Columbus, Neb.—Nebraska State Sportsmen's Association's twenty-seventh annual tournament. G. A. Schroeder, Sec'y.  
May 19-20.—Oklahoma City.—Territorial Sportsmen's Association fifth annual tournament; \$300 added money. J. C. Clark, Sec'y.  
May 20.—Charlotte, N. C., Gun Club tournament.  
May 23-25.—Houston, Tex.—Texas State Sportsmen's Association tournament.  
May 24-25.—Marshalltown, Ia., Gun Club two-day target tournament.

May 24-25.—Mt. Sterling, Ky.—Kentucky Trapshooters' League tournament. Frank Prago, Sec'y, Louisville, Ky.  
\*May 25-26.—Brownsville, Pa., Rod and Gun Club.  
May 25-26.—Shamokin, Pa., Gun Club Spring shoot. S. C. Yocum, Sec'y.  
May 30.—Albany, N. Y.—West End Gun Club tournament. H. H. Valentine, Sec'y.  
May 30.—McKeesport, Pa.—Spring tournament of the Enterprise Gun Club. Geo. W. Mains, Sec'y.  
May 31.—Ossining, N. Y., Gun Club Decoration Day target shoot. C. G. Blandford, Capt.  
May 31.—Dayton, O.—Rohrer Island Gun Club spring target tournament. W. E. Kette, Sec'y.  
June 1-3.—Watertown, S. D.—South Dakota State Sportsmen's Association tournament. F. J. Cory, Sec'y.  
\*June 7-8.—Ligonier, Pa., Rod and Gun Club.  
June 7-9.—Sioux City, Ia.—Soo Gun Club's tenth annual amateur tournament; added money. W. F. Duncan, Sec'y.  
June 8-10.—Huntington, W. Va.—West Virginia State Shoot. F. H. Merrick, Sec'y.  
June 13.—Middleton, Wis., Gun Club tournament. Frank L. Pierstorff, Mgr.  
June 14-16.—Akron, O.—Ohio Trapshooters' League target tournament. G. E. Wagoner, Sec'y.  
June 14-16.—New London, Ia., Gun Club midsummer tournament. Dr. C. E. Cook, Sec'y.  
June 14-17.—Warm Springs, Ga.—Target and live-bird tournament. Chas. L. Davis, Mgr.  
\*June 15-16.—Millvale, Pa., Rod and Gun Club.  
June 15-17.—Lincoln, Ill.—Illinois State Sportsmen's Association tournament. James Davis, Sec'y.  
June 21-24.—Indianapolis, Ind.—The Interstate Association's fifth Grand American Handicap at targets. One thousand dollars added to the purses. Elmer E. Shaner, Secretary-Manager, 219 Coltart Square, Pittsburg, Pa.  
June 27-29.—French Lick Springs, Ind.—Tournament of the National Gun Club. \$500 added money. John M. Lilly, Pres., Indianapolis.  
July 4.—Brunswick, Me., Gun Club all-day target tournament. G. M. Wheeler, Sec'y.  
July 4.—Richmond, Va.—East End Gun Club annual merchandise shoot. J. A. Anderson, Sec'y.  
July 4-6.—Winona, Minn.—The Interstate Association's tournament, under the auspices of the Winona Sportsmen's Club. Oswald Leicht, Sec'y.  
\*July 6-7.—Kane, Pa., Rod and Gun Club.  
July 8-9.—Wausau, Wis.—Wisconsin League of Gun Clubs' State tournament. H. G. McCrossen, Sec'y.  
July 12-14.—St. Paul, Minn., Rod and Gun Club amateur handicap tournament. J. L. D. Morrison, Sec'y-Mgr.  
\*July 13-14.—Scottsdale, Pa., Rod and Gun Club.

Aug. 24-25.—Hot Springs, S. D.—The Interstate Association's tournament, under the auspices of the Hot Springs Gun Club. H. A. Gayhart, Sec'y.  
\*Aug. 25-26.—Tarentum, Pa., Rod and Gun Club.  
\*Western Pennsylvania Trapshooters' League tournaments. C. G. Grubb, Sec'y, Pittsburg.

### DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

The next regular club shoot of the Ossining, N. Y., Gun Club will be held on April 2, commencing at 2 o'clock.

The secretary, Mr. H. H. Valentine, Albany, N. Y., informs us that the West End Gun Club will hold a tournament on May 30.

The East Millstone, N. J., Gun Club announces a merchandise and sweepstake shoot to be held on April 2, commencing at 1 o'clock.

Mr. Gus E. Greiff has accepted a position with the famous firm of Messrs. Schoverling, Daly & Gales, Nos. 302-304 Broadway, New York.

We are informed by Dr. J. B. Pardoe that the Bound Brook, N. J., Gun Club will hold an all-day target shoot on April 16. Free silver prizes will be offered.

The S. S. White Gun Club and the Hilltop Gun Club engaged in a twelve-man team match, March 19, on the grounds of the latter club. The S. S. White team won by a score of 222 to 214 out of a possible 300.

In a five-man team contest between the Harvard Gun Club and the Boston Athletic Association, March 19, on the grounds of the latter, the scores were 210 to 207 in favor of Harvard. Each contestant shot at 50 targets.

An eleven-man team contest, March 19, between the Sewell Gun Club and the North Camden, N. J., Gun Club, was won by the latter club on its own grounds by a score of 195 to 182. Each man shot at 25 targets.

At the weekly shoot of the New England Kennel Club, March 19, held at Braintree, Messrs. Thomas Silsbee, R. K. Longfellow and George M. Paton tied on 25 in the club event. In the shoot-off, Silsbee won. Mr. Henry N. Richards scored a win on the Ashlea cup.

The New Jersey Legislature is taking a very serious view of the anti-pigeon shooting bill. At Trenton on March 17, an immensely long petition evoked action on the part of the House of Representatives, which, after a lively discussion, adopted the minority report favoring the Ernst bill by a vote, under suspension of the rules, of 31 to 11. It will next go to the Senate.

The Brooklyn Gun Club will hold a prize shoot on March 36, commencing at 2:30 o'clock. Mr. John S. Wright, the expert manager, further informs us that the club will hold shoots every Saturday, commencing at the same hour. Take Kings county elevated to Crescent street station, where hacks may be taken to the club grounds, on Kaiser's farm, situate on the Old Mill road.

The secretary, Mr. H. F. Koch, Bethlehem, Pa., informs us that the Lehigh Rod and Gun Club, of the Bethlehems, will hold an all-day target shoot April 7, on the club grounds at Rittersville. The programme consists of twelve 15-target events, \$1 entrance. Highest professional average will win a \$5 cash prize. Professionals may shoot for targets only. Prizes for amateur high averages, \$5 and \$3. Mr. H. F. Koch is the secretary.

Mr. Carl Von Lengerke is recovering rapidly from his recent severe accident. The broken leg is knitting soundly, and will be as good as new in a short time. It will be a pleasure to his many friends to meet him soon and receive his hearty handshake as in days not long since passed.

A match at 50 live birds between Messrs. Fred Miller and Ike Budd, on the Point Breeze race track, March 16, was won by Miller. The scores were 32 and 31 in favor of Miller. A handicap miss-and-out followed the match, the prize of which was a gun. Murphy won in the eleventh round.

The secretary, Mr. Geo. W. Mains, informs us as follows: "At the annual meeting of the Enterprise Gun Club, McKeesport, Pa., officers were elected for the year: Chas. H. Baird, President; Fred Gross, Vice-President; Geo. W. Mains, Secretary; J. F. Calhoun, Treasurer; Phil Ratzsch, Captain. Executive Board: Chas. H. Baird, Geo. W. Mains, Phil Ratzsch, C. L. Kelly, Harvey McFarland. We hold our spring tournament on May 30. Programme out April 1."

A team shoot of more than passing interest took place on the grounds of the Mountainside Gun Club, West Orange, N. J., March 19, between teams of the home club and Nishoyne Gun Club. The Nishoyne team, Mr. R. B. Baldwin, captain, won by a score of 133 to 131. The prize was a Winchester rifle, to go to the shooter making the highest score, and it was won by Mr. Baldwin, who scored 23 out of 25. His success was very gratifying, especially as he contemplated soon a departure for Rawlings, Wyo.

A gun club was organized at Lock Haven, Pa., recently with thirty-four charter members. The club contemplates active competition as soon as grounds are secured, traps installed, etc. The officers elected were as follows: President, George Kremer; Vice-President, Roy Schuyler; Secretary and Treasurer, Ira J. Fox. Executive Committee: J. Hogan Furst, George Kremer, H. G. Shearer, Charles W. Keiger and W. A. Simpson, Jr. Committee on Constitution and By-Laws: S. D. Furst, Esq., Henry Hipple, Esq., P. M. Carskaddon.

On March 16, in the contest for cup of the Florida Gun Club, Dr. Daniel Karsner won with a score of 16, 10 in the main event and 6 in the shoot-off. He was tied by Mr. David T. Dana, of Lencx, who missed his sixth bird in the shoot-off. The other contestants and scores were: Wilbur Whitehead, Cleveland, 27yds., 9; Thomas M. Cook, Pittsburg, 28yds., 9; J. S. S. Remsen, Brooklyn, 33yds., 8; Phil McFadden, Philadelphia, 29yds., 8; George A. Huhn, Jr., Philadelphia, 27yds., 8; Mr. Burke, 27yds., 8; Robert E. Glendenning, 28yds., 8; E. N. Huggins, Poland Springs, 25yds., 8.

The programme of the Indiana State League's eighth annual tournament has been issued. It will be held at Indianapolis, Ind., April 12-13, under the auspices of the Indianapolis Gun Club. There are twelve like events each day, nine at 15 and three at 25 targets, \$1.50 and \$2.50 entrance, a total of 210 targets, \$21 entrance. Events 7 and 9 each day constitute a 100-target race for the individual championship and State League diamond medal, value \$50. To the manufacturer's representative and the amateur making highest average, \$10 respectively. To the amateur making the longest run during the two days, \$5. The handicap committee meets at 8:30, April 11. Handicaps, 16 to 19yds. Amateurs will not be allowed to shoot for targets only. Ship guns and shells to Indianapolis Gun Club, 121 West Washington street. Event 8 of the second day will be the two-man team league contest. The members of the handicap committee are Messrs. John M. Lilly, Ed Voris and J. W. Farrell. Mr. J. W. Bell is the secretary.

The Chicago, Ill., Trapshooters' Association has issued a notice to the gun clubs of Chicago and Cook county, the substance of which is that said Association will conduct a series of five-man team shoots, open to teams of regularly organized gun clubs within the county limits. The Association will donate \$100 for prizes and trophies. Entrance per team \$5. The series will commence on May 7 and will run through a period of twenty-two weeks. Entries close when ten teams have entered. Entries must be with the secretary not later than April 23. The contests will take place at Watson's Park. The secretary is Mr. E. B. Shogren, 940 First National Bank Building.

BERNARD WATERS.

#### Trap at Point Breeze.

PHILADELPHIA, Pa., March 19.—The sixth shoot of the live-bird handicap series at the Point Breeze track to-day, had thirteen contestants. Three tied on 8, and a like number tied for second place on 7. The conditions were 10 live birds, handicap rise: Felix, 29 ..... 2222221020-8 Wingate, 26 ..... 0222201221-8 Payne, 27 ..... \*220220020-5 Shezline, 26 ..... 0020010020-2 Marks, 29 ..... \*111021\*2-7 Smith, 28 ..... 0220222022-7 Paulson, 26 ..... 1020122\*-5 Leaming, 26 ..... 0202-02202-5 Edwards, 28 ..... 2201122102-8 Dewinney, 27 ..... \*212010220-5 Galbraith, 27 ..... 100021111-7 Sweeney, 26 ..... 00\*2220200-4 Freeman, 26 ..... 001\*001100-3

Match shoot, 10 live birds, Rhode Island rules:

Felix ..... 11111101-9 Smith ..... 101111111-9  
Shoot-off, miss and out: Felix 5, Smith 4.

#### The Western Pennsylvania Trap Shooters' League.

PITTSBURG, Pa., March 21.—The following are the dates on which tournaments are to be held under the auspices of the Western Pennsylvania Trapshooters' League:

Herron Hill Gun Club, Pittsburg, Pa., April 26-27.  
Derry Rod and Gun Club, Derry, Pa., May 3-4.  
Brownsville Rod and Gun Club, Brownsville, Pa., May 25-26.  
Ligonier Rod and Gun Club, Ligonier, Pa., June 7-8.  
Millvale Rod and Gun Club, Millvale, Pa., June 15-16.  
Kane Rod and Gun Club, Kane, Pa., July 6-7.  
Scottdale Rod and Gun Club, Scottdale, Pa., July 13-14.  
Tarentum Rod and Gun Club, Tarentum, Pa., Aug. 25-26.

C. G. GRUBB, Sec'y.

#### Rohrer's Island Gun Club, Dayton, O.

At the regular club shoot on March 16, C. Smyth and W. Hanauer tied for first, the former winning in the shoot-off.

A plan is under consideration by clubs of Dayton to select centrally located grounds on which each club may have a certain day each week for shooting; seven of the eight gun clubs of the city are said to favor the scheme. A proposition has been made to form a company and issue 1,000 shares of stock at \$5 each, the money to be used in buying land and fixing it up for shooting purposes. The grounds to be in order at all times for shooting, so that visiting shooters may be entertained.

BONASA.

## ON LONG ISLAND.

### Goose Creek Gun Club.

Rockaway, L. I., March 13.—The main event at the shoot of the Goose Creek Gun Club to-day was at 25 targets, and scores were made as follows: Steffens 16, Wohlmacher 15, Albert 11, Kelk 17, Lahey 18, Rudolph 10, Schleyer 15.

Rockaway, L. I., March 20.—The shoot of the Goose Creek Gun Club to-day had twelve contestants in the main event, at 25 targets. The scores: Steffens 18, Lahey, Jr., 15, Albert 14, Kelk 10, Lahey, Sr., 16, Alsheimer 11, Stickel 16, Baker 7, Wohlmacher 17, Bovie 9, Rudolph 10, Schleyer 11.

EMIL STEFFENS, Sec'y.

### Sheepshead Bay Gun Club.

Sheepshead Bay, L. I., March 19.—The regular monthly club shoot for March took place to-day. The weather could not have been more favorable for the sport. It was clear and bright; in short, it was a pleasant spring day. This may account for the unusually fine scores made by some of the members.

If Messrs. Montanus and Osborn keep in their present form they certainly will be among the first in the Eastern amateur championship event, which takes place on the Sheepshead Bay grounds on April 6.

Event No. 1, club shoot for medal:

Montanus, 9 ..... 11000010110011011111011-25  
Pillion, 10 ..... 001010111111111101001001-25  
Koch, 10 ..... 100100110100001001101111-23

### Crescent Athletic Club.

Bay Ridge, L. I., March 19.—There was an afternoon of lively competition to-day by the shooting contingent of the Crescent Athletic Club. The weather was pleasant.

Messrs. F. B. Stephenson, L. M. Palmer, Jr., and Capt. A. W. Money tied with scores of 21 for the March cup, ten entries. Stephenson is high man for the cup, the three highest scores, 22, 24, 21.

In a nine-man team shoot, 10 targets, H. B. Vanderveer's team won with a score of 58.

Monthly cup, 25 targets, handicap allowance added: F. B. Stephenson (1) 21, L. M. Palmer, Jr. (1) 21, G. G. Stephenson (2) 16, F. T. Bedford (2) 19, A. W. Money (1) 21, H. Werleman (7) 19, D. C. Bennett (3) 20, O. C. Grinnell (6) 16, H. L. O'Brien (4) 15.

Trophy match, 25 targets, handicap allowance added: F. B. Stephenson (1) 19, L. M. Palmer (1) 19, E. H. Lott (1) 23, G. G. Stephenson (2) 20, F. T. Bedford (2) 21, S. Van Allen (0) 24, A. W. Money (1) 17, H. B. Vanderveer (3) 18, W. W. Marshall (5) 18, D. V. B. Hegeman (3) 19, A. G. Southworth (1) 25, D. C. Bennett (2) 20, L. C. Hopkins (2) 21, O. C. Grinnell (6) 14, H. W. Marshall (0) 10, H. C. O'Brien (4) 22, H. Werleman (7) 21, H. T. Kenyon (5) 19, T. W. Stahl (4) 23. Won by Mr. Southworth.

Trophy match, 15 targets, handicap allowance added: F. B. Stephenson (0) 11, L. M. Palmer, Jr. (0) 11, E. H. Lott (0) 8, G. G. Stephenson (1) 12, F. T. Bedford (1) 12, Capt. A. W. Money (0) 11, H. B. Vanderveer (1) 3, W. W. Marshall (3) 8, D. C. Bennett (1) 13, L. C. Hopkins (1) 10, O. C. Grinnell (4) 11, H. W. Marshall (0) 13, A. G. Southworth (0) 14, H. L. O'Brien (2) 12, H. Werleman (4) 11, H. L. Kenyon (3) 9.

Team shoot, 10 targets, scratch:

Capt. A. W. Money's Team—Capt. A. W. Money 6, E. H. Lott 9, L. C. Hopkins 6, S. Van Allen 9, D. C. Bennett 5, C. A. Sykes 7, T. W. Stake 6, H. W. Marshall 4, H. L. Kenyon 3; total 55.

Capt. H. B. Vanderveer's Team—Capt. H. B. Vanderveer 6, F. B. Stephenson 9, L. M. Palmer 8, G. G. Stephenson 8, A. G. Southworth 8, H. L. O'Brien 6, W. W. Marshall 3, O. C. Grinnell 5, H. Werleman 5; total 58.

Trophy match, 15 targets, handicap allowance added: F. B. Stephenson (0) 12, L. M. Palmer, Jr. (0) 10, E. H. Lott (0) 12, G. G. Stephenson (1) 10, F. T. Bedford (1) 11, S. Van Allen (0) 10, Capt. A. W. Money (0) 10, H. B. Vanderveer (1) 7, T. W. Stake (2) 11, W. W. Marshall (3) 10, D. C. Bennett (1) 10, L. C. Hopkins (1) 9, O. C. Grinnell (4) 10, H. W. Marshall (0) 9, H. L. O'Brien (2) 12, H. Werleman (4) 11, H. L. Kenyon (3) 10.

Shoot-off: F. B. Stephenson 15, O'Brien 12, Lott 11.

Saver trophy match, 25 targets, handicap allowance added: F. B. Stephenson (1) 20, L. M. Palmer (1) 21, G. G. Stephenson (2) 20, F. T. Bedford (2) 21, Capt. Money (1) 17, D. V. B. Hegeman (3) 19, H. Werleman (7) 21, H. L. O'Brien (4) 14, A. G. Southworth (1) 21, O. C. Grinnell (6) 17.

### Mineola—Port Washington.

MINEOLA, N. Y., March 21.—Appended are the scores made at the match shoot, March 19, between the Mineola Athletic Club and the Port Washington Gun Club. This gives Mineola two out of three, thus winning the series. The first event to-day follows, and resulted in a tie, 89 to 89:

Cornwell ..... 101100100100100111011000-12  
Seaman ..... 1111111001101111011111-21  
Smull ..... 111000111111001011101100-16  
Valentine ..... 001011010001001001001001-9  
Hyde ..... 101010100010101011110010-12  
Schmidt ..... 0001010110011110111111-17  
Young ..... 001010101010101010101010-11  
Skelly ..... 10011101000110000101001-12  
Hendrickson ..... 1111111110110110111111-21  
Simonson ..... 1110111110010111100011-18  
Bradley ..... 101000100011011010110110-13  
Sprague ..... 101101001000010001100111-12

The second contest to-day resulted in a victory for Mineola, 102 to 84:

Cornwell ..... 10111011101011100100000-14  
Seaman ..... 1011101111111110111111-22  
Smull ..... 111000111100101101101100-16  
Valentine ..... 001101011010010111110111-16  
Hyde ..... 101100101010101101000001-13  
Schmidt ..... 011011111110001110001-17  
Young ..... 0110110100101001001010-12  
Skelly ..... 10001100010010011000110101-12  
Hendrickson ..... 0010110010111110111111-18  
Simonson ..... 1011111010101011011011-18  
Bradley ..... 000101001100101010101010-11  
Sprague ..... 111110101111100101010101-17

Ten target sweep: Cornwell 3, Smull 8, Sprague 8, Bradley 6, Hendrickson 9, Apgar 8, Murphy 4, Valentine 2, Simonson 7, Young 5, Schmidt 5, Skelly 4.

Ten target sweep: Cornwell 5, Smull 6, Sprague 3, Bradley 6, Hendrickson 9, Apgar 8, Murphy 4, Valentine 2, Simonson 7, Young 3, Schmidt 5, Skelly 4.

### Independent Gun Club.

EASTON, Pa., March 19.—The following scores and explanations are the outcome of the championship shoot held at our club grounds on above date. Messrs. Maurer and H. Snyder, who held the championship of the club, retained the championship after a hard race, Messrs. Skeds and Brunner having given them a little scare; but even with this, the champions held their nerve, and outshot them in the finish. The scores:

Shot at. Broke. Shot at. Broke.  
W H Maurer ..... 100 69 O Skeds ..... 100 76  
H. Brunner ..... 100 60 H. Snyder ..... 100 76

Immediately after this shoot the champions were again challenged to shoot by Messrs. Heil and Transue, who say they will give them a good race and expect to reap the laurels. The date of this match will be set later. The club then participated in a practice shoot, with the following results:

Shot at. Broke. Shot at. Broke.  
J E Frederick ..... 100 79 Salesman ..... 50 25  
E F Markley ..... 100 74 H Transue ..... 25 17  
G Elliott ..... 70 39 E Jones ..... 25 8  
H Miller ..... 75 55 F Weiss ..... 20 6  
H Snyder ..... 85 41 A Sutter ..... 75 30  
I Miller ..... 50 19 J Burner ..... 5 2

J. E. Frederick, our left-handed crackjack, leads the list of the day, as usual. When he does not lead, he is either sick or has poor shells.

Owing to the high winds prevailing, scores of the shooters were not up to standard, and many of the boys say that when our professional friends visit us, as they intend to, at our tournament on April 21, they will have to keep their eyes "peeled" to keep goose eggs from the score sheets.

E. F. MARKLEY, Sec'y.

### Keystone Shooting League.

HOLMESBURG JUNCTION, Pa., March 9.—The prize shoot, a handicap, \$2 miss-and-out, permitted the contestants one re-entry. From the 27yd. mark Mr. Charles E. Geikler, killed 12 straight on his first chance, and took an order for a handsome Easter hat. He missed his second bird on his other chance. Fred Coleman, the State champion, shot from 31yds. He lost his twelfth bird on each chance. W. T. Smith missed his twelfth in his second string. Ed Johnson lost his tenth dead out on his second string. The scores:

First chance: Geikler, 27yds., 12; Coleman, 31yds., 11; Bridge, 26yds., 8; Vandegrift, 29yds., 7; Budd, 30yds., 7; Smith, 27yds., 5; Frank, 29yds., 6; Morris, 27yds., 4; Johnson, 28yds., 3; Harvey, 29yds., 1; Jenkins, 29yds., 0.

Second chance: Coleman 11, Smith 11, Johnson 9, Bridge 6, Frank 4, Harvey 2, Morris 2, Budd 2, Jenkins 1, Geikler 1, Vandegrift 1.

The birds were strong and fast.

Open sweepstake, 7 live birds, handicap rise, \$3 entrance, three moneys:

Morris ..... 2212112-7 Vandegrift ..... 2202220-5  
Coleman ..... 2222222-7 Smith ..... 0121120-5  
Geikler ..... 1212122-7 Johnson ..... 0102221-5  
Harvey ..... 2222111-7 Budd ..... 0201011-4  
Frank ..... 0222222-6 Jenkins ..... 1010101-4  
Murray ..... 1210122-6 Campbell ..... 0120201-4  
Hack ..... 1111011-6

### Trap at Point Breeze.

PHILADELPHIA, Pa., March 16.—A match at 50 live birds between Fred Miller and Ike Budd was the event of main interest at Point Breeze to-day. Budd was not shooting up to his usual form by many degrees. Miller lost 5 dead out. The birds were good, and a stiff wind helped them materially. The scores:

F Miller ..... 22\*222222222\*0220000222222002022\*022022200220-32  
I Budd ..... 122010\*110020220022202\*022010102112220010202121022-31

Handicap shoot, miss-and-out: Morris (28) 1, Oliver (27) 1, Torpey (29) 0, Coleman (30) 10, Paulson (26) 0, Felix (29) 5, Davis (28) 2, Oliver (27) 5, Muller (29) 0, Hothersall (28) 0, Galbraith (27) 10, Muller (29) 6, Murphy (30) 11, Davis (28) 1, Muller (29) 6, Felix (29) 2, Hothersall (28) 4, Torpey (29) 2, Kopp (28) 0, A. J. Miller (29) 10, Oliver (27) 2, Pine (28) 0, Kopp (28) 0, Pyne (28) 0, Kepp (27) 0, Pyne (27) 0, Edwards (27) 0.

### Rochester Rod and Gun Club.

ROCHESTER, N. Y., March 16.—Some back scores were shot up to-day at the shoot of the Rochester Rod and Gun Club in the weekly spring handicap:

Brk. Hcp. Tot'l. Brk. Hcp. Tot'l.  
Rickman ..... 12 5 17 Kay ..... 19 4 23  
Rickman ..... 16 9 25 Kay ..... 19 5 24  
Rickman ..... 15 9 24 Wride ..... 13 10 23  
Rickman ..... 15 9 24 Wride ..... 16 11 27  
Rickman ..... 15 9 24 Wride ..... 12 9 21  
Kay ..... 20 4 24 Watson ..... 18 7 25  
Kay ..... 20 4 24 Clark ..... 17 5 22

The challenge contest for the Monroe county championship diamond medal has been postponed from March 23 for one week, and will be shot for on the regular weekly shooting day, Wednesday, March 30, at 2:30 o'clock.

## Cup Presentation.

CINCINNATI, O.—A few of the friends of Hon. Thomas A. Logan, known to the majority of shooters as "Ackley," and to many of the older generation of sportsmen as "Gloan," author of a work on shooting and of many interesting and instructive articles in the sportsmen's press, entertained him at a banquet given at G. W. Schuler's, on the evening of March 17. The affair was gotten up for the purpose of showing the love and respect which they feel for him, and in appreciation of the character of true sportsmanship which he has always upheld and exemplified in his dealings with his brother sportsmen and fellow men. He was one of the early leaders in trapshooting in Cincinnati, and is almost the only one of the old guard left who can be met at the traps; at over seventy-five years of age, he is still as enthusiastic as ever, and as ready to devote his time and energies to forward any movement promising to advance the interests of the fraternity. He was active in the organization of the old West End Gun Club in 1859, and was a leading spirit of the Cosmopolitan Gun Club, formed in 1884, for a number of years the most exclusive club in this city. He was an officer of that club, and for several of the last years of its existence his efforts alone prevented it from disbanding.

When the Cincinnati Gun Club was formed, in 1898, he transferred his allegiance to that organization, and is still a loved and honored member. He has set a high standard for the sportsman, and has always vigorously combatted every move which tended to lower that standard. An ardent lover of field sports, he has always been an able advocate of game protection and was one of the original members of the Cuvier Club when it was formed as the Ohio State Society for the Protection of Game and Fish, in 1871. He served for a number of years as an officer and on important committees.

The tables were spread for over forty, and there were few vacant chairs. The decorations consisted of ferns and flowers, and at each place was a shamrock in honor of Supt. Arthur Gambell and St. Patrick.

Col. Bob West was toastmaster. After the cigars were lighted, he began his duties by informing Judge Logan that the affair was gotten up wholly with the view of honoring him; and then, in a few well chosen words, he presented him with a magnificent solid silver three-handled loving cup as a token of the esteem and love felt for him by those whose names were engraved thereon.

Judge Logan was taken completely by surprise, but recovered in a moment and responded as follows:

"Mr. President and Gentlemen: Upon occasions similar to this, it is quite customary for the recipient to protest vigorously that he is taken by surprise, and probably he frequently is, although not always so; but I can assure you most earnestly and truthfully that I am really and entirely surprised. I have not had the slightest intimation of your purpose. I came here to-night with no thought except to join in the celebration of the birthday of our popular superintendent, which I was glad to do. I had no idea for a moment that the object of this meeting was to extend beyond that, and now that I have listened to these unexpected words of friendship and regard, and see this magnificent token, it completely overpowers me. At the moment I can think of no tribute that could come to any man that would touch him more deeply than this has touched me. To a professional man the highest tribute he may hope to receive is one which he may have from his professional brethren in token of some great success or progress in the directions they jointly follow, but an offering like this is of a different character. It comes to but few men in their lives, and when it does come it appeals to the heart, and I feel more sensibly than I ever thought to feel the force of the quotation that 'the heart feels most when the lips speak not.'"

He then spoke of his earnest interest in the success of the Cincinnati Gun Club, of the pleasant recreation he enjoyed with its members, of the deep friendships he had formed in the club, and of the deep appreciation he felt for the honor conferred upon him. He concluded feelingly as follows:

"It is true, as has been said, that in my time I have been connected with many associations of a similar character, but I can say frankly once for all, that never in my career have I found myself surrounded by a body of gentlemen more completely in accord with my feelings; that more completely command my respect and my love, as those individually and collectively that I have found in the Cincinnati Gun Club. If I say once more I thank you, it will be but a poor expression of what I would like to say, but I give you a pledge that the memory of this night, accompanied by this token of friendship, shall abide with me while memory remains."

As one of the old-time shooters, and one who has been associated with Judge Logan as a member of many of the old gun clubs, Maynard was called upon. In the course of his remarks he said: "We indict Judge Logan to-night, not for an offense he has committed, but for the good he has done, while he has been associated with us. He has been with us not because he has won cups or money, but because he loves the sport. Some people

were born with a silver spoon in their mouth, but he was born with a gun in his hand, and is an expert in all that relates to guns. Despite his handicap of years, he continues with us and sets a good example to the younger members."

In conclusion, he said: "We want you with us as long as you live, and trust that will be for many years."

Other speakers were S. O. Cundy, an old-timer, and champion shot; John W. Coleman, the originator of the testimonial to the Judge; George Krehbiel, Dr. Beebe, Emil Werk (Chief Rio Grande), who spoke of his first meeting with the Judge at Vincennes, Ind., while snipe shooting, and sang a few verses of the song which gave him the title he bears as a member of the Indians; J. J. Faran; G. W. Schuler enlivened the evening by the story "Can He Stand the Gaff" and several vocal selections. A. C. Dick, A. B. Heyl, Theo. Foucar, J. E. Block, Milt Lindsley, C. W. Phellis and Arthur Gambell. Telegrams and letters of regret at their inability to be present were received from Joe Coyle, J. B. Mosby and R. F. Davies. The speakers told many good stories and witty anecdotes, but the main portion of their remarks expressed the esteem felt for the honored guest.

The toast of the evening was proposed by Mr. F. E. Pond, and was drunk standing: "May the accurate aim and active interest of Ackley be maintained for another quarter of a century; the pen and precept of Gloan continued to promote sportsmanship, and the name of Thomas A. Logan be enrolled among other patriarchs of the craft—such as Izaak Walton, Daniel Boone and Isaac McLellan—who were hale and hearty until their years scored nearly 'a hundred straight,' while, like our guest, they were honored because they loved their fellow men."

The festivities lasted until a late hour, and were brought to a close with the singing by all present of the song "Farewell, My Own True Love."

The cup was of solid silver lined with gold, about 12in. high, with three handles. On the space between two of the handles is engraved a wreath of oak and laurel leaves, joining the monogram T. A. L., at the top with a pair of crossed guns surmounted by a pigeon, and encircling the inscription "Thos. A. Logan, 'Ackley.' From Sportsmen Friends. 1904." On the other spaces are engraved the names of those who joined in the testimonial, as follows: L. F. Ahlers, E. B. Barker, J. E. Block, Gus Boeh, F. E. Bullerdick, B. F. Beebe, J. W. Coleman, Joe Coyle, A. W. du Bray, R. F. Davies, A. C. Dick, E. A. Donnelly, Theo. Foucar, J. J. Faran, A. Gambell, A. B. Heyl, W. Harig, H. F. Jergens, Geo. Krehbiel, M. F. Lindsley, W. F. Linn, J. B. Mosby, J. C. Norris, H. M. Norris, Geo. Osterfeld, H. Osterfeld, F. E. Pond, C. W. Phellis, H. S. Rosenthal, G. W. Schuler, F. See, F. C. Tuttle, E. O. Underwood, H. Van Ness, R. H. West, J. E. Worth, E. Werk, F. J. Waddell.

BONASA.

## Springfield Gun Club.

SPRINGFIELD, O.—Following are the scores made at the regular shoot on March 19. In the Young handicap medal race Strong won with a score of 23, at 17yds. Young was high man with 92 at 18yds. Strong second with 83. The scores:

Events:	1	2	3	Events:	1	2	3

## Ossining Gun Club.

OSSINING, N. Y., March 19.—The appended scores were made at the regular bi-monthly shoot of the Ossining Gun Club. Some very good shooting was done by a boy seventeen years old, T. S. Delamater, who had shot at clay targets but twice before. If he is able to follow the sport up he will make the "bunch" here "step some" to keep in his class.

C. G. B.

## Harvard—B. A. A.

BOSTON, Mass., March 19.—On the grounds of the Boston Athletic Association at Weston, the five-man team contest between Harvard and the Boston Athletic Association resulted in victory for Harvard, as the subjoined scores will show:

Harvard—Bancroft 44, Wright 40, Foster 45, Marsales 40, Ward 41; total 210.

Boston A. A.—Ellis 44, Hunter 40, Blinn 36, Frost 43, Gleason 38; total 201.

## Cincinnati Gun Club.

CINCINNATI, O.—The following scores at 50 targets were shot last week in the cash prize race of March 12, by members who were unable to be present on that day: C. Dreihls (16) 45, Grau (18) 42, Sampson (17) 37, Davies (18) 36, Bleh (16) 36, Dick (18) 36, H. Sunderbruch (17) 34, A. Sunderbruch (20) 32.

The fifth in the series of team races was shot March 14, and resulted in a victory for Gambell and Barker by a score of 170 to 148. This gives them a lead of 94. As there was no hopes of reducing this materially, the other five matches of the series were declared off. The winning team is looking for more victims. The scores: Gambell 81, Barker 89; total 170. Medico 84, Davies 64; total 148.

The scores in the five matches show very consistent work on the part of Barker, who has been high gun in all but the first.

Match, 100 targets: Gambell 89, Medico 84.

St. Patrick was greeted with a pretty mean sample of weather in this village on the 17th. Cold, cloudy, windy in the morning, it settled down in the afternoon to a heavy rain and a strong wind. Only a few members mustered up courage enough to visit the grounds, and several of them shot their score in the Parker gun contest, besides taking part in the other events provided by Supt. Gambell in honor of his patron saint.

A high wind and occasional hard showers made the shooting in the afternoon of March 19 difficult and uncomfortable, and the boys quit about 5 o'clock. In the Parker gun event Randall and R. Trimble tied for high gun on 89 actual breaks. Pfeiffer was second with 86.

Emil Werk starts for Duck Island on the 20th for a try at the ducks.

Stanley Rhoads was in the city, but the bad weather prevented him from coming out to see the boys.

C. W. Phellis made a flying visit to the city on purpose to attend the Logan testimonial supper on the 17th, and left early the next day.

C. O. Cundy, of Atlanta, Ga., one of the old-timers, has been in the city a few days and visited the grounds to-day.

Ackley had the misfortune to blow the stock of his gun to pieces on the 17th, but fortunately escaped unhurt himself.

Two prominent shooters of Ohio (names will be furnished on request) will shoot a team match of two men from any State except Iowa, at 100 live pigeons, 31yds. rise, 33yds. boundary, for any sum from \$500 to \$1,000 a side. Match to be shot on grounds of Hilltop Gun Club, Austerlitz, Ky. There's a chance for some one, but it will not be "easy money."

The scores of March 19, Parker gun shoot, handicap allowance added, follow: Randall (15) 100, Pfeiffer (40) 100, Maynard (18) 100, Jack (30) 100, Kramer (40) 100, Plunkett (40) 100, Willie Green (40) 100, Norris (30) 100, Boeh (40) 100, Pohlar (35) 100, Bullerdick (30) 100, Linn (25) 95, Medico (12) 93, Block (18) 93, Captain (25) 93, A. Sunderbruch (10) 92, R. Trimble (0) 89, Herman (30) 88, Williams (18) 69.

Match, 50 targets: Gambell 44, Sunderbruch 39; total 83. Don Minto 37, Medico 44; total 81.

BONASA.

## New England Kennel Club.

BRAINTREE, Mass., March 19.—The New England Kennel Club's shoot to-day was notable for high scores. In the cup event Messrs. Thomas Silsbee, R. K. Longfellow and George M. Paton were tied with scores of 25. Silsbee won in the shoot-off, and won the cup. He also was high man in net scores in the club cup shoot by breaking 24.

In the shoot for the Ashlea cup, Henry N. Richards was high with a clean score of 25. His handicap brought his gross score up to 29. Silsbee was second in the Ashlea cup contest, with 24 net, 25 gross. In the Ashlea cup contest Mr. Longfellow still leads, having three wins to his credit. The summary:

Club cup:				Ashlea cup:			
Broke.	Hcp.	Tot'l.		Broke.	Hcp.	Tot'l.	
T Silsbee.....	24	1	25	W R Goodnow..	18	3	21

## Cleveland Gun Club.

At the semi-monthly shoot of the Cleveland Gun Club, on March 16, in Class A, Williams was high man with 38, and Rogers was second with 35, and won first in Class C. Snow, in Class B, was first. Bigelow led in Class D. The weather was cloudy, but no wind was blowing. The scores:

Club shoot, 40 targets: Williams, Class A, 38; Rogers, Class C, 35; Snow, Class B, 34; F. G. Hogen, Class B, 32; Bigelow, Class D, 27; Gaylord, Class C, 26; F. H. Wallace, Class C, 23; Auer, Class C, 18; Kliver 10.

## IN NEW JERSEY.

## New York German Gun Club.

Carlstadt, N. J., March 16.—The shoot of the New York German Gun Club to-day at Outwater's, was well attended, nineteen contestants participating. Messrs. Van Valkenburg, Kroeger and Metzen were guests. In the club, 10-bird event, the three visitors scored 9 each, and were high. The three birds following the 10-bird event represent unfinished scores from the shoot of Feb. 17, which stopped on account of darkness:

E. Von Kattengell.....	30	7	1012021111—	8	221
H. W. Mesloh.....	28	7	2011122010—	7	121
J. Schlicht.....	28	7	1020120212—	7	122
E. Steffens.....	29	7	0111*2120—	6	212
P. Albert.....	28	6½	1121122001—	8	101
P. Garmis.....	28	6½	0211110110—	7	121
A. E. Hendrickson.....	28	6½	2020020010—	4	020
Dr. G. V. Hudson.....	29	7	0120112012—	7	101211021—
Gus Hagenah.....	25	4½	2222012022—	8	
C. Van Valkenburg.....	28		222222202—	9	
H. Ludeking.....	25	4½	0001020*12—	4	000
R. Baudendistel.....	28	6	010221222—	8	
J. P. Dannefelser.....	28	6	0*2002200*—	3	211
W. Lempe.....	25	4½	0021001202—	5	011
Jas. Zeman.....	25	4½	1002000210—	4	001
J. H. Kroger.....	30		1111011222—	9	
H. Meyn.....	28	6	012*10*01—	4	201
C. Metzen.....	28		22*2222222—	9	
J. F. Wellbrock.....	29	7	22222*202—	8	121

A friendly match for the price of birds, between Messrs. Mesloh and Schlicht, resulted in a victory for Mesloh in the twenty-third round, his allowance of two making him a winner. The scores: H. W. Mesloh.....2 1 0 2 2 1 1 0 1 1 1 2 0 0 2 2 0 0 1 2 2 2 2—+2—19  
J. Schlicht.....2 0 2 0 \* 1 1 1 2 0 2 2 0 2 1 1 2 2 2 2 0 1 0—17

A 5-bird sweepstake, \$2 entrance, three moneys, 50, 30 and 20, resulted as follows:

Mesloh.....	10212—4	Van Valkenburg.....	01*22—3
Hendrickson.....	00021—2	Barberi.....	22012—4
Wellbrock.....	20212—4	Hagenah.....	20002—2
Baudendistel.....	02102—3	Schlicht.....	01002—2
Steffens.....	01102—3	Ludeking.....	00110—2
Albert.....	0021*—2	Dannefelser.....	11211—5
Von Kattengell.....	22110—4		

Von Kattengell was first in \$1 miss-and-out, four entries. In the second miss-and-out, \$1, Von Kattengell and Van Valkenburg tied on 3.

## North River Gun Club.

Edgewater, N. J., March 19.—Mr. F. Truax was the winner of the handicap trophy shoot of the North River Gun Club to-day. That was event 5, and handicaps apply to it only.

Targets:	25	15	10	15	25	10	10
C. E. Bickhoff, 3.....	20	9	7	10	13	7	7

Schmargel.....				4	6	4	
Wagner.....	21	9	6	10	13	4	

JAS. R. MERRILL, Sec'y.

## Montclair Gun Club.

Montclair, N. J., March 19.—A goodly number of the members of the Montclair Gun Club were present to-day at the weekly shoot of the club.

The weather conditions were all that could have been desired, and there was no excuse for low scores unless it was that the birds were thrown very swiftly.

This club depends mainly upon its own membership for support, and to a very small extent upon outsiders, and has made no particular effort to secure high scores by throwing an easy target.

The members' cup contest continues until the middle of April. Over 1,500 targets were thrown. Mr. Sim Glover was present to demonstrate his powder, and shot along with the club.

Messrs. Holzderber and Cross, of the Montclair Golf Club were the guests of the club. The scores are appended:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	Broke.	Av.
Targets:	10	10	10	10	10	10	10	10	10	10	10	10	10	10	10	25	90	.920

EDWARD WINSLOW, Sec'y.

## South Side Gun Club.

New York.—Through the generosity of C. W. Feigenspan, the popular young sportsman of Newark, N. J., the South Side Gun Club of Newark, N. J., has been presented with a \$1,200 automobile, with a request that it be put up as a prize, to be shot for by amateurs in open competition. The conditions under which this valuable prize will be shot for are as follows:

A series of five 100-target re-entry matches, aggregate of two best scores to count, only one score to count on each match day, entrance price of targets only at 2 cents each. Contestants must compete in at least three of the five shoots to be eligible to win the prize. The series will start on Saturday, April 23, and end on Saturday, May 21. If, however, there are any ties, those in the tie will shoot off same on Saturday, May 28.

Mr. Feigenspan has also donated a silver loving cup, which will be presented to the professional, ex-professional or trade representative making the best score under the above conditions.

The matches will be held on the grounds of the South Side Gun Club at the foot of Broad street, Newark, N. J. Two sets of traps will be used, and the shoots will start at 10 o'clock each day. Lunch and ammunition can be obtained at the grounds. Take Central Railroad of New Jersey, to Broad street, and trolley south on Broad to Vanderpool street. Walk east one block under Pennsylvania railroad, turn to right along railroad to grounds. For further particulars, write or call on M. Herrington, Room 1735, 150 Nassau street, New York.

## Boston Gun Club.

Boston, Mass., March 16.—The patience of fourteen shooters was tested to the limit to-day at the regular Wednesday shoot, trapping facilities having a matinee for the first time in the history of the club and preventing the usual amount of targets from being thrown in the endeavor to satisfy the desires of the trapshooting aspirants.

The friends of the club were, as usual, in the majority and did not miss one chance in endeavoring to right matters, though it was an impossibility, and as a last resort the club set up an improvised system, and by the shooters making allowances for mistakes, etc., the events were run off in fair style.

The honors of the afternoon were taken care of by the visitors, Griffith and Thomas securing the two leading positions in the prize match, and the former averaging high for the afternoon, .812 per cent., showing an average of more than the usual from a Boston Gun Club standpoint.

Targets:	15	10	10	15	10	15	Av.
Griffiths, 19.....	12	7	7	13	10	12	.813

## Aquidneck Gun Club.

NEWPORT, R. I.—This week's shoot, postponed from Wednesday to Thursday, March 17, was made the occasion for a somewhat more pretentious affair; a longer programme was arranged, and we had with us several well-known outsiders.

From Providence came a squad headed by Griffith, including Messrs. Root, Bennett, Bain and Arnold. The Canonchet Club sent over McArdle, Sorenson, Winter and Burns. These, with nine of the locals, made up a very respectable party.

The day was a raw one for March. A bright sun and no wind made shooting a pleasure.

High average was taken by Griffith with 92 per cent., his score including a run of over 40. Second place was taken care of by Manchester, who also shot well, running his first 25 straight:

Events:	1	2	3	4	5	6	7	Broke.	Av.
Targets:	10	15	20	20	20	20		115	.920

## Herron Hill Gun Club.

PITTSBURG, Pa., March 17.—Kindly announce to your readers that the Herron Hill Gun Club, of Pittsburg, Pa., will be an applicant for the State shoot of 1905, at the meeting of the Pennsylvania State Sportsmen's Association, to be held at York, Pa., May 16 to 21, inclusive.

W. S. KING, Sec'y Herron Hill G. C.

## Poughkeepsie Gun Club.

POUGHKEEPSIE, N. Y., March 17.—Although the weather conditions were good to-day, none of the ten men that faced the score did anything wonderful in the shooting line, and as reason therefor are too numerous to mention, no explanations will be attempted.

J. Rhodes made a full score and won the cup. As Smith failed to tie him on the shoot-off for last week's cup, he practically scored a double win.

A number of the boys will attend the weekly shoot of the newly organized New Paltz Club, on Monday, the 21st.

SNANIWEH.

## SIDE LIGHTS OF TRADE.

W. R. Crosby, at Americus, Ga., March 7, broke 98; at Macon, Ga., March 8, 97; at Columbus, Ga., March 9, 98 out of 100. At Americus, Messrs. Sells and Loving won first and second amateur averages. At Macon, first, second and third amateur averages were won by Mr. Ch. Jones, Mr. Jones and Mr. McNeal. At Seneca, Kans., March 9, the professional averages were won by Fred Gilbert and F. H. Lord; the amateur averages by L. Reed and E. L. Witzig. Mr. Reed also won the loving cup. At Aberdeen, Md., March 10, the three first averages were won by L. S. German, J. M. Hawkins and Wm. M. Foord, respectively. H. B. Ten Eyck and U. G. Tingley won first and second averages respectively at Bound Brook, N. J., March 12. All used Winchester factory loaded shells.

Fred Gilbert, with the Parker gun, at St. Joseph, Mo., March 12, defeated Mr. Wm. Clayton, of Kansas City, in the challenge contest for Wyeth trophy, 100 live birds per man. Mr. Gilbert, 33yds., killed 98, and Mr. Clayton, 29yds., killed 96. Gilbert scored the first 70 straight, also 4 practice birds. His score of 98 out of 100 is also a world's record from the 33yds. mark. At Seneca, Kans., March 10, he won high average with 349 out of 365 targets.

F. C. Richl, at Aberdeen, Miss., March 11, broke straight, 70 flying targets. He used a Remington gun. H. G. Taylor won high average at the Seneca Gun Club shoot, Kansas, March 8 to 10, with over 93 per cent., using U. M. C. factory shells. F. D. Ellett, Keithsburg, Ill., won first average at Joy, Ill., with a score of 94 per cent., and he also won a live-bird match, killing 50 birds without a miss.

At the Interstate midwinter tournament, Seneca, Kans., March 8-10, Kansas City five-man team No. 1 won both the Interstate team match at targets and live birds. The individual live-bird handicap was won by Mr. Dave Elliott, of Kansas City, Mo. He shot from the 31yd. mark, scoring 24 without a tie. Each shot Peters factory loaded shells.

## PULISBHERS' DEPARTMENT.

## Pennsylvania Railroad's Washington Tours.

THE Pennsylvania Railroad's sixth three-day personally-conducted tour to Washington will leave New York, Brooklyn, Newark, Elizabeth and Trenton, March 28. Round trip rates—only difference being in the hotel selected in Washington—are \$12 and \$14.50 from New York; \$10.50 or \$13 from Trenton, and proportionate rates from other points. Tickets cover railroad transportation for the round trip and hotel accommodations. A special side trip to Mt. Vernon may also be taken. All tickets are good for ten days, with special hotel rates at expiration of hotel coupon. For itineraries and full information apply to Ticket Agents; Tourist Agents, 263 Fifth avenue, New York; 4 Court street, Brooklyn; or Geo. W. Boyd, General Passenger Agent, Broad Street Station, Philadelphia, Pa.

# FOREST AND STREAM.

## A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1904, BY FOREST AND STREAM PUBLISHING CO.

TERMS, \$4 A YEAR. 10 CTS. A COPY.  
SIX MONTHS, \$2.

NEW YORK, SATURDAY, APRIL 2, 1904.

VOL. LXII.—No. 14.  
No. 846 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

### IN FLORIDA.

AUDUBON'S portrait of the greenshank has peculiar interest, because the species is European, and there is no other recorded observation of its occurrence in North America. Audubon shot three of the birds on Sand Key, six miles from Cape Sable, in the spring of 1832. It was certainly a curious circumstance that these wanderers so many thousand miles from their accustomed haunts should have found here in Florida the naturalist's pencil to perpetuate them for us. Audubon, indeed, did not recognize them; he took them to be telltale godwits, and when he had them in hand imagined them to be new; but was set right by his companion, who was familiar with the European greenshank and identified them as belonging to the species.

The picture has an antiquarian interest also, because the artist has chosen for the background a "View of St. Augustine and Spanish Fort, East Florida," as he saw them, only ten years after Florida had come into the possession of the United States, and five years after Fort San Marco had been given the name of Marion the Swamp Fox. Audubon's view of the town and fort and harbor shows them as they remained in general outline as late as the seventies; and as, indeed, some of us may wish they might have remained to this day, at all events with this once characteristic suggestion of bird life about them. In no respect have the natural conditions of "East Florida" changed more completely since Audubon's day than in this of the wild life which once was so conspicuous a feature and is now so meager. Audubon saw the Florida bird land in its pristine freshness and plenitude, and he looked upon it with the same enthusiasm and delight which permeate all his descriptions. It is good to go with him through the Florida of the thirties, as he takes a schooner from St. Augustine to explore the St. John's River. As the vessel made its way across the shoal bar, "my eyes, however, were not directed towards the waters," he tells us, "but on high, where flew some thousands of snowy pelicans, which [at the report of the pilot signal gun] had fled affrighted from their resting grounds. How beautifully they performed their broad gyrations, and how matchless, after a while, was the marshaling of their files as they flew past us! On the tide we proceeded apace. Myriads of cormorants covered the face of the waters, and over it the fish-crows innumerable were already arriving from their distant roosts. We landed at one place to search for the birds whose charming melodies had engaged our attention." On shore, that February morning, "the blossoms of the jessamine were steeped in dew; the humming bee was collecting her winter store from the snowy flowers of the native oranges; and the little warblers frisked about the twigs of the smilax."

It is all very charming and alluring as he describes it, even the clouds of "blind mosquitoes," which had no sting, but swarmed about them in such numbers one night as to extinguish the light and sacrifice themselves in hosts between the leaves when Audubon surrendered and shut up his journal.

The Florida of that day was a land of ever unfailing interest for the bird lover. If the more valued species have now become few in number and rare, there is yet reason to believe that conditions are changing for the better. The bird butchers' "exterminatory peregrinations," as our contributor Didymus so aptly termed them, have been suppressed by law and by public sentiment; and the Florida landscape may once again be brightened by the flash of bright plumage. A State whose tourist interests are so large cannot fail to find bird protection good business.

As yet, however, the barbarians are abroad in the land. A Florida correspondent of the New York Herald re-

ports that two northern visitors brought into St. Augustine as a trophy of their prowess a six-foot alligator which they had killed with rifles, and it is added that "the beast made a desperate struggle for its life." Of what nature is the "desperate struggle" a creature can make against a brace of repeating rifles! And is not the doing to death of a six-foot alligator rather a slender claim to glory in the society news columns?

### FOR THE SPORTSMAN TOURIST.

AMONG the interesting things brought out by the publication of Mr. Grinnell's "Trails of the Pathfinders" is a little volume entitled, "The Travelers' Directory through the United States, containing a description of all the principal roads through the United States, with copious remarks on the rivers and other objects. To which is added an appendix containing post-office regulations, land offices and military posts, together with a census of the United States and a comparative and prospective view of the population. The whole illustrated by appropriate maps by John Melish. A new edition revised and enlarged, New York: published by A. T. Goodrich, at his Geographical Establishment, 124 Broadway, 1825." The little book is loaned us by our valued correspondent, Mr. H. L. Allen, of Staten Island.

This directory gives the roads by which the different portions of the country may be traversed, naming the towns on the road and often side remarks referring to the natural features of the country. Thus, on page 49, the article describing the road from Washington to New Orleans by Staunton, Knoxville and Nashville, says, opposite the name of the town of Lexington, "At fourteen miles from Lexington, two miles to the west is a Natural Bridge one of the greatest curiosities in the world."

There is much that is quaint and interesting in the type matter of this little volume, which is, however, almost entirely statistical.

Its most interesting feature, however, is the map. On it we see, in the east, the States much as they are to-day, but when we get as far west as Lake Erie, we find that Detroit is in Michigan Territory, while to the west of Lake Michigan is the Northwest Territory, including what are now Wisconsin and parts of Michigan and Minnesota, and to the west of the States of Missouri and Illinois and of the Northwest Territory, is the great Missouri Territory, including what are now Kansas, Nebraska, Iowa, parts of Minnesota, North and South Dakota, and parts of Wyoming and Montana.

The western border of the map includes the heads of the Marias, the Two Medicine Lodge and the Missouri Rivers in Montana, and shows, in the mountains at the head of the Yellowstone River, a lake called Lake Eustis.

Further to the south on the Rio Del Norte is Santa Fe, not very far from the heads of the Canadian Rivers, but there is no road leading to it, for the Santa Fe trade had not yet become established.

The town of Chicago is shown on the map, and a trail leading thence southwesterly to Arkopolis, the Hot Springs, and Natchez, where this trail meets a wagon road.

Many of the western rivers are named as they are to-day, but it is not without interest to see in Dakota, not far from the boundary line and just west of the Red River, the "Lake of Devils," which we know to-day as Devil's Lake. The old name for the Niobrara River is here printed "R. Quicourre, or Running Water."

Away to the west in the mountains there are practically no names. On the heads of the Arkansas River are "James Peak," now Pike's Peak, "Castle Rock," and a little more than two degrees further north, three high mountains are indicated, with the name "Highest Peak."

West of the Mississippi River, towns were few, though in Louisiana there were half a dozen, and as many in Arkansas Territory and Missouri. Just below the Council Bluffs, the map shows Fort Calhoun, and there was a St. Peter's military post, presumably on the St. Peter's River, though we do not see it on the map.

Here and there little triangular marks show, representing Indian tents, "Old Kansas Vil.," "Tetons of Burnt Wood," "Old Rickeree Village," "Mandans;" and just north of the Mandans, between the Cannon Ball and the Little Missouri Rivers, perhaps about where the town of Mandan now stands, is "Fort Mandan."

The statistics as to population are interesting. We are told that the population of the United States had increased from 3,929,326 in 1790, to 9,609,827 in 1820. New York had the greatest population, 1,379,939; Virginia the next, 1,065,366; with Pennsylvania a close third, 1,046,844. The smallest named population was that of Michigan Territory, 8,896.

It is interesting and curious to glance over this little book and to compare the conditions in this country seventy-nine years ago with those of to-day.

The sportsman tourists of 1825, planning journeys into new and unexplored regions, had only this material to study. Truly of them it might almost have been said: "The world was all before them where to choose."

### GOOD SHOTS ON BOARD SHIP.

IN the matter of target shooting, the doings of the navy, in its big-gun practice, receive very little attention by the average landsman. One cause of this seeming apathy may be in the ignorance of the average landsman on all matters pertaining to the deep sea in general, and naval matters in particular. Yet all Americans keenly admire skillful marksmanship, and that is one of the points on which the men of land and sea are one in common interest.

The recent exhibition of the Kearsarge gunners with the powerful guns of war, will gratify all Americans. Rear Admiral Taylor, Chief of the Bureau of Navigation, on March 21, reported to Secretary Moody, in part, as follows: "One 13-inch gun made six hits out of seven shots, in five minutes and twenty seconds. One 8-inch gun made ten hits out of ten shots, in five minutes and twenty seconds. One 5-inch gun made eighteen hits out of eighteen shots, in two minutes. You could have covered all the holes in the target with a hall rug." When it is considered that the shooting was done at a distance of 1,600 yards, at a target 17 by 21 feet, the wonderful precision of it is apparent.

### NEXT WEEK.

The series of chapters following the "Trails of the Pathfinders" is attracting much attention and is read with growing interest. They give the individual personal element of the Louisiana Purchase theme; and it is always the individual and personal in which we are most interested. Mr. Grinnell has had the good sense to let his heroes in large measure relate their experiences for themselves; and this makes the story all the more real and graphic. Next week's chapter will relate to Alexander Mackenzie and his voyage to the Frozen Ocean.

The press published last week the story of the fate of Leonidas Hubbard, Jr., of the exploring party sent into Labrador last summer for the Outing Magazine. Mr. Hubbard starved to death last October; a report of his death came from Labrador in January, but was unconfirmed until the receipt last week of a letter from Dillon Wallace, his surviving white companion. The distressing details have been printed at length in the daily papers; and it is not necessary to repeat them here. But the awful sufferings of the Hubbard party should not fail to serve as a warning and a deterrent from other like ill-considered enterprises. The two white men and an Indian plunged fatuously into what they believed to be an unexplored wilderness, insufficiently provisioned, inadequately fitted with transportation for what supplies they did have, and unequipped with any knowledge of woodcraft which might sustain them after their provisions should be exhausted. What happened was precisely what might have been expected to happen under the circumstances. The one bright gleam in the dismal story is the courage with which the men endured their suffering, and the unselfish devotion of each member of the party to his fellows.

There have been published numerous and persistent reports of a great mortality of Adirondack deer during the past winter. In a communication in our shooting columns Chief Protector Pond gives an authoritative contradiction of the sensational stories. Some deer have been found dead, but the number is so small as to be altogether insignificant. The Chief Protector has done well in the way to set the false rumors at rest.

# THE SPORTSMAN TOURIST

## Fields and Pastures New.

My first trout was caught in a New Hampshire brook, over thirty years ago, and my first quail and duck were shot in Ohio several years before. Scarcely a year since has passed without my getting an outing, long or short, near or far, as circumstances permitted; and it has been my privilege and pleasure to catch trout in the Alleghenies, Adirondacks, around Lake Superior and in the Rockies, and to shoot white tail and black tail deer, elk and antelope, as well as smaller game, in these and other districts. I had, however, never shot or even seen moose or caribou, and longed for new game and new country, which I found as told hereafter.

### I.—Temagami.

In northern Ontario, about half way between Toronto and the southern end of Hudson's Bay, and about 200 miles east of Lake Superior, lies the "Temagami Forest Preserve," part of the great wilderness which extends indefinitely northward. Its only roads are Indian trails; its only houses Indian cabins and posts of the Hudson Bay Company, and these are very scarce; and the few Indians and whites who permanently make their home there practically depend on the only local staple, fur, the sable and mink skins obtained being especially dark, fine and valuable. Each Indian has his trapping range, often very extensive, and his rights are respected by others, and pass to his children by inheritance. Trespass is very rare and is a grave crime, which custom permits to be prevented or punished by any means found necessary.

Here the ancient backbone of the continent, the Laurentian Mountains, has been planed by glaciers and gnawed by weather and time, until it has become rolling or hilly country, ridged and ragged with rocks, dotted with countless lakes, and covered in large part by splendid forests of white and red pine, which, so far, have been spared the ax. Through the tangled swamps and boggy lakes splash and stalk the magnificent moose. The black bear and lucivee roam the forests, and the mink and martin are many. Ruffed grouse are numerous and ridiculously tame, and the scarcer and more solitary spruce grouse is often met with. Big black bass, pike and doré, the latter being the pike perch and locally known as pickerel, abound in the lower lakes and larger streams and, above the high falls impassable to these, the speckled trout have taken refuge and thrive and increase abundantly. Temagami itself, most beautiful of lakes, with its multitude of channels and arms extending for hundreds of miles and studded with numerous islands, abounds in lake trout and whitefish, which grow to great size. The serpent in this earthly paradise is the scourge of black flies, midges and mosquitoes, which appear about the first of June, make the summer months almost intolerable, and practically disappear by the middle of August. In the month of May the fishing is at its best and the flies have not arrived, and with September comes the shooting season and the flies are gone, so the tender-skinned Yankee had better visit the country in May or September, and avoid the months between. A few of the pests appear at the end of May and a few linger to the first days of September, so a provision of fly dope and veils is expedient.

This wilderness is reached from Lake Temiskaming either by the Montreal or Metabetchouan Rivers, the sole means of travel being canoes. The camp and personal outfit, tents, blankets, supplies for the journey and all luxuries must be taken from civilization, though flour, meal, sugar and such supplies can generally be obtained at the Hudson Bay Company's post at Bear Island. As everything must be carried over numerous portages, some of which are a mile or more in length and quite rough, the importance of going light is manifest and at the best travel must be pretty slow. A canoe and guide should be provided for each of the party, and an extra guide with canoe to carry supplies, cook and attend to camp, leaving the "sports," as those visiting the country for pleasure seem to be invariably called, and their personal guides, free to get away from camp in the morning or come in late at night, without the domestic economies being upset thereby.

To avoid payment of duties, supplies of all kinds should be purchased in Canada, at Toronto or Montreal as may be convenient, and furnished in sacks convenient for portaging. They can be checked as personal baggage. Michie & Company, grocers of Toronto, make a specialty of supplying tourists and have given me complete satisfaction. Sleeping bags, tents and camp and personal outfit I have found could best be obtained from New York dealers. Take the usual trout fly equipment, a light steel rod with spinners and spoons, and 200 feet of No. 20 annealed copper wire for deep trolling. For moose I have found the new .33 caliber Winchester "take down" quite sufficiently powerful and very handy, while the lightness of both gun and cartridges is a great advantage. A light .22 caliber rifle or target pistol will be found useful for grouse or to give a finish to one of the big Temagami Lake trout, if you are lucky enough to hook him.

Guides vary as human nature always does. Mine were excellent woodsmen and excellent fellows, though sometimes rather slow, and did their very best to get me good sport. Others that I saw and heard of were inefficient, and as usual in such cases sulky in proportion.

The regular rates are two dollars per day and twenty-five cents per day for canoe. Tents and blankets can also be rented if arrangements are made in advance. The ice goes out of the lakes from April 20 to May 1; but vegetation hurries forward to get its work done during the short summer, and leaves can be almost seen to grow. Light snow and freezing nights may be expected early in October, and pretty heavy snow is probable by the end of that month. One is always likely to meet cool or even cold weather, and the clothing and outfit should be provided accordingly. I went in by way of Toronto and Mattawa, met my guides at Temiskaming, and went by steamer up the lake; but a railroad was then being built from North Bay to Lake Temiskaming, which may be now in operation, and will give a much better route, saving several days' paddling and portaging.

My first trip here was in the fall of 1900, when I stayed only a few days and spied out the land. The following spring my wife and I started in at Haileybury, went up the Montreal and through Lady Evelyn and Sucker Gut Lakes, and up a river which meets the extreme end of the latter, to which we gave the name "Lemabin." After passing three large falls we found wonderful trout fishing; in fact, the trout were so numerous that an hour's fishing per day would furnish all that could possibly be used, and fishing had to stop. Thence we went down through Temagami and out by the Metabetchouan, a canoe trip of over 200 miles in all, taking three weeks and full of delights.

In the fall of that year I went back hoping to get a moose, but went in several wrong directions, struck bad weather, was taken ill, and was too weak to trail the only moose I saw, after shooting him through the neck. My guides followed and finished him, but his head was not worth mounting. This was outside the forest preserve in which shooting was not then permitted. The prohibition was removed the year after, and another trip provided me with a really fine specimen, having a maximum spread of 55½ inches, with very regular and beautiful antlers. This moose was evidently still young, and his horns seemed light for the great size of the animal. I measured him with great care and found his dimensions to be: Nose to tail, 10 feet 1 inch; girth, 8 feet 3 inches; hind leg to ridge of back, 6 feet; height at shoulder (estimated) 6 feet 9 inches.

Visitors to this country will find it wise to comply strictly with the requirements of the local laws, which are in no way unreasonable. The authorities maintain a surprisingly efficient system of inspection, and the penalties inflicted on a detected offender are very severe. One can have plenty of sport legally, be safe from penalties, and, best of all, enjoy the approval of his own conscience.

### II.—Newfoundland.

During the last trip to Temagami I met some New York gentlemen, who had been caribou hunting in Newfoundland the year before, and they were good enough to give me a full account of their experience, with names and addresses of their guides, routes and sources of supply, and, in fact, all the detailed information that one has usually to laboriously, tediously and expensively acquire for himself. I at once began correspondence, and succeeded as I thought in making all necessary arrangements, and our party of four left Cleveland on August 24. Four days' steady travel, by way of Boston, Plant line steamer to Hawkesbury, Cape Breton, rail to North Sydney, the steamer Bruce to Port au Basques, and the Newfoundland railway, would bring us to Grand Lake, where guides, boats and supplies were to be. The actual trip did not work out quite according to schedule, on account of some delay in the arrival of articles ordered shipped from New York, not quite time enough having been allowed.

Newfoundland is roughly triangular, the sides being about 350 miles each, and much indented with bays and long narrow fjords. St. John's lies on the extreme southeastern corner, and Port au Basques on the southwestern. A total population of about 140,000, of which St. John's has 40,000 and about all the remainder live on or near the coast, make a laborious and precarious living by and on the product of the seal, cod, and herring fisheries, which are almost the only productive industries. The climate is too boreal and the soil too barren to admit of much agriculture, and there is little timber fit for anything but pulp and fire wood, but, in scenic beauty, and as a home for game and fish, few if any lands surpass or even equal it. The lower levels are like the Temagami country, though the rivers are finer, the hills higher and the whole landscape on a grander scale. The elevated plateaus, which make up a large part of the interior and are called "barrens," are unlike any country I have ever seen, and must resemble the Scotch moors, though with much more woodland. They are a series of rocky ridges and knolls, often several hundred feet high and some miles apart, divided

by valleys containing numberless streams, lakes and marshes, and dotted here and there with patches of densely growing spruces and balsams. Much of the higher land is covered with a growth of dwarf spruce and juniper, rarely exceeding three feet in height, and matted and tangled beyond description. It is too thick to walk through and not quite thick enough to walk on, and would be practically impassable for civilized man, were it not for the caribou paths, which radiate in every direction and are beaten down by centuries of use.

The caribou moss, "sphagnum," I think, forms a soft mass of a foot or more in depth, and holds water like a sponge. Everything below the ridges is soaking wet, and one's feet are in the water most of the time; a good stock of waterproof foot gear is therefore necessary for comfort. Boots are too noisy for stalking, and moccasins are difficult to keep at all dry, so a lumberman's overshoe, or rubber moccasin with leather tops, would seem to be indicated and I shall try them this fall.

The Newfoundland railway, a well constructed narrow gauge line, runs from Port au Basques to St. John's, curving northward to about the center of the island and making a line of 540 miles in total length. An express train, with parlor and dining car, is run in each direction three times a week, with a mixed train on alternate days. In summer the express starts on time and is rarely very late; while the mixed train is likely to turn up anywhere from two to twenty-four hours after schedule time. In winter, which begins about October 15 and lasts until May, I understand that it is not unusual for trains to be run three months apart and to be four months late in arriving, but this is beyond my personal experience.

The harbor of Port au Basques is a small basin, entered through a cleft or cañon and surrounded by rocky ridges, sparsely mottled with scrubby vegetation and irregularly placed whitewashed cabins. One is at first reminded of pictures of Iceland and Greenland, but the railroad soon passes into a more attractive country, crosses or skirts several magnificent salmon rivers, and after a run of about 100 miles, comes down to the splendid salt water ford called "Bay of Islands," fifty miles long by a mile or two wide, and bordered by stately hills which are nearly worthy of the name of mountains. Into the head of this bay flows the Humber River, a glorious salmon stream of large size, flowing between lofty hills, precipitous cliffs, and all that is picturesque in landscape. Ascending this river it first widens out into Deer Lake, and then contracts again into the upper Humber, into which flows the Junction River, the outlet of Grand Lake and another superb salmon stream. The two log cabins which form Grand Lake Station are just west of the latter river, and there is a fine salmon pool immediately below the bridge. Grand Lake, about seventy miles long and one to three miles wide, stretches off to the southwest, bordered by rapid slopes rising to the great upper barrens, 1,500 feet above, promontories of which make picturesque headlands, and down which flow a series of dashing streams.

The journey down Grand Lake is made in dories; and parties can leave the lake and climb to the barrens at any one of many points, being practically sure of good shooting anywhere. We went down the lake some thirty or forty miles, and made the climb and journey over the barrens to our main camp very easily in one day. That is, it was easy for us, but how our guides climbed that fierce hill and tramped across the scrub under their huge packs, was a wonder to me. They were thoroughly skilled woodsmen, keen sportsmen, willing, prompt and highly efficient; in fact, the best guides I have ever had, and were well satisfied to receive a dollar and a half a day each, which also paid the hire of two dories.

Caribou hunting here is real deer stalking, the game being often found, and its size and value determined with a powerful field glass at a mile or two away, and then approached with due regard for the wind and cover. The large stags are always quite light in color, showing a great deal of white, which increases as the season grows later, while the does, yearlings, calves, and young stags are much darker, often showing a good deal of black. A distant white spot is always worthy of careful examination and, if it proves to be a deer, his value as a trophy can be often pretty well determined by his color, long before his antlers can be seen. Many of the does bear horns, though these are always small; but I noticed that no does which had calves with them bore antlers, and think it possible that they are worn only by does that are barren that year, and hence can apply to the growth of horns the strength that nursing a calf would otherwise consume. The coat is very thick even in summer, and, with the heavy body, makes the hornless does and calves look much like Jersey cattle in figure, though the coloration is black, gray and white instead of fawn. A large stag will weigh nearly or quite 500 pounds, and is therefore about twice the size of our red deer, and half that of our elk. They seemed to me notably unsuspecting and easy of approach, far more so than any other of the *Cervidae*, so that with reasonable care there was little difficulty in getting

THE GREENSHANK—AN OLD WORLD VISITOR.  
With View of St. Augustine and Spanish Fort San Marco.

DRAWN FROM NATURE BY JOHN JAMES AUDUBON IN 1831.

THE THIRD FALLS OF THE THE LEMABIN.

A GOOD STRIKE—LAKE KOKONSEE.

PHOTO BY ARTHUR ST. JOHN NEWBERRY.

within good range; and, like the elk, they certainly succumbed more quickly to wounds of the same gravity than the Virginia deer.

In the early part of September the stags are beginning to shed the velvet, the biggest doing so first, my guides said. Does and fawns could occasionally be seen in the open all through the day; but most of the deer then pass the day in the woods, coming out when the sun is low and going back in the morning, so the shooting is best done in the evening and at sunrise. One can get through the marshy valleys with ease, through the scrub or "bushes" with difficulty, and through the woods scarcely at all, so the game must be caught in the opening. My guide and I sat on a little knoll one evening, watching the deer come out of the woods and wander over the marshes, when a yearling walked up within thirty yards of us, and refused to go away for some fifteen minutes, though we stood in plain sight and pelted him with stones. He was a beautiful light, iron gray, and as he stared and pranced in excitement was a charming sight.

It is well known that the Newfoundland caribou have particularly heavy and fine antlers, and that many have two large brow paddles, which often interlock, instead of one paddle and a single spike as seems to be generally the case in Maine and New Brunswick. Our two licenses entitled us to six heads, which we got in a very few days, and all were good specimens. My best head had thirty-six points, each antler measuring three feet two inches around the curve, and with a maximum spread of two feet eight inches, the horns being of good weight and very uniform. One of my companions got a much heavier and finer head, though the two horns were less alike. Two of our party were college boys, neither of whom had ever shot a deer, and they both got good heads.

Shortage of supplies compelled us to get back to the railroad, and, after this deficiency was remedied, we went about ten miles up the lake and camped by a river flowing into it. It was high noon and a bright day when we arrived, but I got out a light trout rod and began casting over a pool in front of the camp, using No. 8 trout flies. After taking two or three nice trout and a one pound salmon, my flies swept into an eddy, sank a little and stopped dead. I struck and put quite a pull on and nothing happened, so said to my guide, "That's queer, but it don't feel like a rock somehow." Just then there was a convulsion and a big, silvery speckled fish shot out a good two feet. I eased him down, he rested a few seconds, made a short circle and jumped again. So he kept it up, never offering to run, but going out of the water just twenty times and getting half way out on the twenty-first, but finally was tired out and landed. He was my first salmon of any size, and a big fish for my tackle, though he only weighed six pounds. Next year I shall go properly equipped, fish systematically, and hope for something bigger.

Taken all together, in ease of access, beauty, variety and number of fish and game, and interest of the sport, Newfoundland equals if it does not surpass any country I have visited.

A. ST. J. NEWBERRY.

CLEVELAND, Ohio.

## Floating Down the Mississippi.

### VIII.—A Cotton Town—Part Two.

"KING COTTON" is a suggestive title. There are "oil fevers," "gold fevers," and real estate booms, but in the main agriculture has outgrown the point where men become excited by the possibility of getting rich from a crop in the ground. New countries which promise much wealth in the way of tremendous returns in harvests create a slight furore compared to those of mines and precious sands. But cotton is an exception to the general rule, in one great section of the Basin. As the old prospector has "no thought, no hope, no wish but gold," so the confirmed cotton man can think only in bolls, seed and lint, and the price thereof. He "eats, drinks and sleeps cotton." Whatever his occupation may be, whether whittling a stick or reading the paper, it's the cotton crop or the price of cotton he has in mind. And it is not a small subject he has to deal with. It's the markets of the world on one hand and the work of the weather on the other. In Lake county the crop failures depend on three conditions—floods, weevils and frosts. This year flood and frost wrought disaster at both ends of the cotton season. The high water kept the fields covered so long that it was late or not at all before the seed was hilled in. In the fall, while the bolls were still green, the frost came hard and heavy, and so prevented many of the bolls from opening. All the cotton country which ships to Memphis was affected by the bad season, and when at last the bales began to come in it was less than a third of a normal crop—the high prices did not make up for the deficit in the farmers' pockets. Hard times were promised for the valley this winter by the existing conditions.

It happened that I reached Tiptonville when as much of the cotton as ever during the present season was coming to the gins. The day I got there I saw cotton picked for the first time—a lot of negroes, men, women and children, with white duck bags tied to their waists into which they were stuffing the seed-cotton as fast as they could pick with both hands. They held their fingers almost straight, closing on the stuff from all sides as it rippled from the boll. All of the sacks were two feet wide, but the "chilluns" had three-foot long ones, and others six, nine, twelve and even fifteen-foot sacks, the cloth being of eight ounce duck as a rule. These sacks are hung by a strap, as the hunter's bag, and on the same side. When it is more or less full the picker takes it to the big wagon in the middle of the field where the farmer weighs the stuff on a steel-yard swung from a sort of gallows, usually. Allowance is made for the weight of the sacks, and the net result credited to the picker in the "book." Then the cotton is poured into the wagon, fluffing out of the sack in a mass, which one sees further across the level purple fields against the distant cypress of varied shade, than he can the wagon and mules—a pure white flash, inexplicable until it has been explained to the unaccustomed seer.

The 3½x3x12 feet or so wagon box full, the traces of

the patient mules are hitched up—the impatient ones are brought with caution from the fence—and the wagon joins the procession on the road. This year the cotton wagons were far apart in Tiptonville's district, it being a third-of-a-crop year.

It's a sight of the valley to see the wagons on their way to town, with their negro drivers, who snap short-handled long-leashed whips till the reports are heard as far as a shotgun, some faces hideous, some so cheerful as to spread a smile all over the landscape. Here and there in the line a man has a "pick" of cotton between his lips, especially if it is cold weather—he's usually a white, on his way to town to collect or get the best price for his load—"eating cotton," as they say they do. My impression of a load of cotton had been that of the baled stuff, but here were loads of the raw, unginned seed cotton, like a load of potatoes, only white, with black specks, in proportion to the farmer. If the farmer is a good man, his cotton is almost clear white, for his

THE MISSISSIPPI BANKS AT TIPTONVILLE.

pickers have to "pick" cotton or be docked. The sloven's, however, is full of bolls and twigs, showing that his is "pulled" cotton, and likely enough he is docked for the weight of the bolls at the gin.

It's cotton—but the wagons rumble over the baked-mud roads, slow driven, the panting of the teams, the crack of the whips, and the sound music to the farmers, for "the crop's moving" and cash is coming in. 2,500 to 3,000 pounds make a load, and the stuff is sold by the pound—3 cents up to 3 1-4 or 3 1-3 at Tiptonville this year for the seed cotton, as the farmer brings it to the gin. Fifty bushels of potatoes would weigh 3,000 pounds, and might bring the farmer \$40. A load of cotton brings from \$60 to \$100 per load. It is interesting to consider that an acre of potatoes in these bottom lands—with two crops, would bring more than the cotton, as prices now run for the vegetable in the valley—but cotton is a good gamble. A man never does know how much he can get out of it, and the price may run sky high.

Tiptonville has several cotton buyers. The gins hire men to buy for them, one for each gin. Some gins have their own lands, as the Harris Estate Gin, below Tiptonville. The renters of the 12,000 acres of Harris land bring their cotton to the gin, and are paid more than the prevailing price of cotton in the other gins. There are gin companies, with gins all through the cotton belt, and some little gins run by independents, who get out a few hundred bales and make a living for the owners. These little gins are "in the way" of the big companies, and one of them near Tiptonville was most aggravating. He paid more than the prevailing rate invariably—just enough to get all the cotton he wanted, say 3 1-2 when the price was 3.

The Old Cypress by the River.

In early November this buyer had a talk over the telephone with a commission man at Memphis, who wanted to know what he would sell a hundred bales for. "Nine cents," was the answer. Unknown to the ginner, cotton had gone up, and the price next day would be 3.25 for seed cotton, while to sell at the price he had contracted for he couldn't pay more than 3.15 or 3.20. He was careless, and it cost him over \$500; for when the other gins heard of his difficulty, the price paid for cotton went up to 3.30, and great was the glee of the superintendents when they heard of the old man's ravings. The farmers who had received a higher price on their cotton on his account would accept nothing less than the prevailing price, of course.

Buying cotton is an art, demanding experience, a knowledge of market conditions and tact, more especially tact, as witness the commission merchant who caught the old man. It is so with the street buyer in a town like Tiptonville, though he receives his instructions from

Memphis as to what he can pay. The cotton crop value, depending somewhat on the weather a thousand miles up the Mississippi, the general conditions in the cotton belt and in Egypt, and market on labor conditions in Massachusetts, on industrial affairs in Europe, on the avarice of some unknown group of speculators and other whimsical world-wide features, has connections somewhat like wheat. The buyer must be an able hot-air merchant, as they say, to talk to the farmers, and explain things to them, else a rival walks off with the stuff. Some of these street buyers for gins come to think they know all that can be learned about cotton, and go in on their own hooks. One Arnett at Tiptonville, a farmer, did that. Some idea of what can be done in the cotton belt may be realized from the fact that when Arnett failed it was for about \$300,000, and he paid seventy-five cents on the dollar. Cotton is a good deal like the old ducky's mule. It's whimsicalities can be foreseen to a certain extent, and the forces guided, but beyond an x point, it goes into business on its own account, and comes out yellow—but triumphant. Arnett began as a farmer, took to buying from his neighbors, put up a gin, reached toward Memphis, but went under. When I saw him, Arnett was tearing down his gin—unchanged in appearance for the past twenty years, I was told. A long gray beard, bright "searching" eyes, 170 pounds crowded into five feet seven, he looked, walked and acted the keen old farmer that he used to be and is.

The town marshal at Tiptonville, being obliged to walk the streets most of the time by virtue of his office, became also buyer for the "New Gin." One Tateham, recently from Kentucky, whose wife is weaver for the rival gin, and Marshall Thurmond illustrated one phase of cotton buying while I was at Tiptonville. A farmer with eighty acres or so to pick, came to town, and, naturally the buyers wanted to get his first load, to "get the crop coming their way." Three cents was offered, and the other bid 3.05, and the price went up till one man reached his limit, both as to price and temper—"strong-minded men, both," I was told. The first hot word spoken, perhaps six more followed, and then Tateham went backward through the window of the post-office, with a knife in his hand. Tateham got a lot of broken glass in his back, and Thurmond a slash in the leg. Spectators intervened, the sheriff put them under bonds, and for a couple of days the men did not show up, waiting for their wounds to ease a bit.

"It won't stop here! No, sir! This ain't the last

A TIPTONVILLE COTTON GIN.

of it. One or other of them men will git killed, he sure will! They're both strong-minded, determined men!" I heard on all sides. It was with interest that I gazed at these two men, Thurmond big, florid, and burly—an ex-prize fighter, it was said, and the other lean and dark and tall, some stooped. The prospective victims of a tragedy. It was said that they were both willing to let the matter drop right there, but "of course it wouldn't do for them to have any words!"

The gin is not without its incidents. Superintendent Bray, of one of them, boarded at Mrs. Foster's, at Tiptonville, and I came to know him of course. One night the whistle of his gin began to toot in short blasts, the signal of "Fire!" Bray jumped from the supper table, and away he went—a lamp had been overturned and a bale of cotton almost burned up, but the gin was saved. "You never did see a man git like Mr. Bray did!" Mrs. Foster said, adding, "Once there was a gin here that had a fire two or three times a week, but the engineer would toot his whistle and they all would come from town and put the fire out, and do you know, they never did git to burn that gin, but had to tear it down!"

The gin is where they separate the seed from the lint, and then bale it. A fan sucks air through galvanized iron pipes, called "sucks." The end of this pipe drops into the wagon outside the gin, and up jumps the cotton, and is dropped from a trap which opens automatically, by the shutting off of the air, and the cotton is then in the cotton house, whence it is sent in another pipe to the gin-house, men called "suckers" feeding it to the floor-sucks with their hands and a fork. One sucker is white, the other black, "because, you see, if they was both black they'd both play, but when one's white, he makes the other do the work, mostly."

The distributor feeds the four gins—seventy pairs of saws constitute a gin—the saws snatch the lint from the seed, and send one flying and the other dropping. The lint is carried by air to the cog-rollers, which reduces it to more or less regular sheets, and it is poked down into a box by a negro pressman, and then a steam press compacts the stuff, time and again, till about 500 pounds are in the box, upon which another box, on the two-box turnstile comes under the chute of cotton, and the full box over a screw press, which, from beneath, shoves all taut, so the balers can wrap with sacking and loop with the iron-band ties, and key them up. Released, the cotton, enveloped in sacking, is ready to ship.

At the entrance, the wagon load of seed cotton, as brought by the farmers, is weighed, and when the wagon is re-weighed, and the cotton weight found, the superintendent, or weigher, or weigher, makes out an order, showing the gross weight, the net weight, and the price

per pound, and the sum total. This order is cashed at the gin's bank, whichever one it happens to be.

The weigher has some things to watch out for. One farmer tells of selling his ninety pound dog ninety times in one fall, and still possessing the dog. The dog was in the cotton, and wasn't in the wagon when it was returned to be weighed—ninety pounds, at the rate of 3 cents a pound would be \$2.70 a load, or \$243 all told. Others have been known to "sell," or attempt to "sell" their children in the same way. One must watch out for yellow cotton—cotton that has been stained by rains, or "burned" by being held too long in private cotton houses, or too many hulls and woody debris. Some loads must be docked, but when competition is strong, not much docking is done. Figuring up the value of a load when it weighs, say 2,965 pounds net, at 3.27, with the farmer complaining that the gin scales didn't give him within a hundred pounds of what his steel yard weight in the field amounted to, the ginners—two for four gins—yelling "More cotton! More cotton!" to the slow suckers, and ringing the bell, and the local blowhard giving some anecdote, and perhaps the round bale press expert coming in with a request for some different hammer or wrench from the blink-blank one at hand—to figure accurately under such circumstances is a job in the daily experience of the superintendent. But he has a cotton calculator, which tells him the value of every possible load of cotton from one pound to 200,000 pounds, at any conceivable value from a cent a pound to fifteen cents. A glance at the printed page of figures shows it all. The only need is to read the scales and the calculator right.

The toot of the cotton gin's whistle, far heard, and at frequent intervals during the day—and night, too, when the crop is big—is a most impressive feature of the cotton country. Close at hand the red, or black, buildings, a chimney spouting a combination of soft coal and wood smoke, ventilators from which fly shreds of white, snowy lint, the suck "overflow" from which flies a cloud of dust at intervals—darkies singing, mules laying their ears back suggestively, whips crackling, cotton wagons full and empty, the hum of the gins and fans, and the old farmer, perhaps some negro "uncle" renter, out at the knees, heels, elbows and toes, clutching between thumb and forefinger the slip of yellow paper, calling for \$75—five per cent. of what his 100-acre crop will bring—such a spectacle will make even the old-time cotton man step to one side for another look from a more advantageous view-point.

On Saturday "evening"—the afternoon—the pickers are paid off, and come to town. They throng the streets, all manner of colored folks, spending what they have earned during the week. With from four to fifteen dollars "spending money" each one chooses and selects. "They buy what they want, if they've got the money to pay for it." Fruit, chickens, canned stuffs, dress goods, anything and everything they can see that promises good looks or a pleasant taste. In the back alleys, in the shacks that are white-washed, one hears the click of little cubes of "ivory," a low, droning noise, as the players of craps whistle and call for luck. In the jail are some crap players, and the marshal is always on the lookout for them—but nevertheless "Coontown" is frequently in evidence," as the local paper says. And once in a while "Coontown" adds a coffin to its purchases, due to failure of the cubes to be thoroughly understood by all parties present.

Around the gin in picking time, and in the streets on a Saturday evening, one sees and hears the things that go to individualize the cotton town.

To the tourist from the spruce pulp country, it's a place for wide eyes, and the notebook man feels helpless and grows irritated because so much is there to collect. Stray expressions, colds facts, red-hot figures.

Cotton land is owned mostly by large holders—by men who own plantations. Witness the Harris Estate with 12,000 acres. These men rent their land out at from \$3 to \$5 an acre, and perhaps a sub-renter pays six dollars an acre for choice land. The land is worth from \$30 to \$150 an acre, and produces from half a bale to perhaps two bales. 1,500 pounds of seed cotton makes a bale, and the gins figure that the seed will almost pay the expense of ginning and the lint pays for the cost of the seed cotton and makes the profit. In Lake county, Tenn., there are seventeen gins, fifteen running this year, with a daily output of from ten to sixty bales a day.

All the land, with the exception of five or six small—say hundred-acre—patches, is in the hands of estates or large holders. "That's the trouble." Let land be put on the market and the big holders outbid the little men. Land can't be bought. But there is cotton land left by the river after every flood. If a man knows the way the river is wiggling, he can run in and after a year of squatting take out a deed for "300 acres, more or less." This land, some of it in the hands of thriftless negroes, or dangerously situated as regards the river, may be had at from twenty-five cents an acre up. Some people are taking up such claims—usually clay lined river folks, who keep a skiff, a flat boat and a house boat in the back yard against the spring floods.

But however interesting cotton and a cotton town may be, at the end of three weeks, during which I "wrote up" and took a look at Reelfoot Lake, I grew uneasy, I one day went afloat from Tiptonville, having waited in vain for a medicine and show boat, which I had seen up-stream, and wished to join. I found the river not less interesting than before.

RAYMOND S. SPEARS.

## Mr. Hubbard's Death in Labrador

Editor Forest and Stream:

THE reports of Mr. Hubbard's death by starvation, on the watershed of the Northwest River in Labrador, are perhaps not accurate as described in the daily press, but unless information to the contrary reaches us it would seem as though the party was not quite sufficiently skilled in woodcraft. Mr. Hubbard died about the middle of October, and had been on scanty diet for a month. From the 15th of September to the 15th of October one might expect to find a good many kinds of food, excepting on the rocky barren plateau.

Assuming that bears, beavers and caribou were not easily obtainable, although all are inhabitants of the

region until the caribou move southward, one would expect to find the following supplies:

Porcupines, woodchucks (*Arctomys*), hares, red squirrels, lemmings, and several smaller rodents. We have depended upon hares for meat at times when we were too much engaged in exploring to care for variety in food. They are easily caught by setting snares in the runways, and the rudest and most carelessly arranged snares of common string gave us all of the meat that we wanted. A pail half full of water set in a runway, and containing a little seal oil for bait and to keep the water from freezing, will catch so many small rodents during the night that one is not likely to go hungry unless he is squeamish.

Porcupines are pretty good eating, and are to be found in the spruce valleys. Woodchucks are not good eating, and are not common, but their holes can be found occasionally. Foxes, wolves, lynxes and otters are practically out of the question for food supply, unless one has unlimited time for outwitting them, or for finding their haunts.

So far as my experience goes, trout and chars will bite at any time of the year, although they will not rise to the fly excepting during the summer. They will take natural or artificial bait of various kinds.

Suckers can be snared in the still waters if one is equipped with a small "waterscope."

Eels are abundant in most of the streams until hibernating time. But they probably ceased to bite in September.

Ciscoes and other *coregonus* could undoubtedly be caught in a small gill net set at night, although we have not tried it. The gill net would certainly pick up suckers.

For starchy food, one can find almost anywhere collections of ferns, and the rhizome of one that is common in Labrador (*Osmundia*?) is fairly good eating. It seems to be the chief food of the bears when they first emerge from winter quarters.

The fruit of the curlew berry (*Empetrum*) and of two cranberries remains upon the plants all winter, and in such abundance that one need not go very far without getting a supply. The young tops of caribou moss, though astringent, have a fine flavor, and contain enough starch to make the caribou fat. Poplar buds can be obtained almost anywhere where there is any sort of wood. They are a favorite food of ptarmigan and grouse, and are not to be despised as a luxury when one is exploring. The buds of willow and of white birch can be obtained pretty generally in Labrador, but they are not good to eat excepting when one is starving. The buds of the white bush maple are good and wholesome.

The rhizome of the yellow water lily is almost as full of starch and as meaty as a potato, and if one could get the tannin out, it would make an abundant and excellent food supply. I have eaten it several times, but the tannin spoiled it for food, excepting in an emergency.

The yellow water lily is found practically everywhere in the "scoop hole marshes" of the sub-arctic region, and if some chemist will tell us how to get rid of the tannin without spoiling the starch, he will be one of the famous public benefactors.

According to the newspaper reports the party make no mention of ptarmigan or of spruce grouse, and one would judge from this that for some reason these abundant birds were absent from the region traversed. Personally I have never been out of reach of one of them in Labrador, but have heard from the Indians that they sometimes leave a locality for a while. An exploring party is apt to make the mistake of carrying too many supplies. The tendency is then for one to go for as long a time as possible on the food in the pack, and then to become weakened, and to lose the ambition required for living on the country. I have done it myself. This happens particularly when one has set a time limit for getting to a certain spot, a fault common with men from a clock country, but not one that can be charged against the traveler in a sun and moon country.

If some of us were going over the country traversed by the Hubbard party we would take no provisions at all excepting enough seal oil, salt and pepper, for flavoring the luxuries that we could pick up. We would have tea and tobacco, to be sure, and these two things would be so good all of the while as to pay for the whole trip. If we set a time limit on getting to any given place and return we might expect to perish before getting back, unless the time limit were elastic enough to allow us to get back "in the spring or by summer, or perhaps not until fall, but look for us by winter anyway."

Some of us do not believe that "sad tales of privation and hardship" are often necessary. We go into that sort of thing voluntarily on the football team. Some of us have been in the wretchedest country in the north, with no dry clothes for two weeks at a time, often making some sort of camp in a swamp or on a cliff when caught by night, sometimes with not a thing to eat all day long, because the storms were too furious, or there was no time to stop to get food. Cold, wet, and hungry—this may sound like complaint and a sad tale, but it is not. Personally I would rather be there now than to have the best bed and board at the Waldorf-Astoria, although I dine there to-night. Give me instead a seat on the thick wet caribou moss, with the sleet bounding off from the tin platter that is washed sometimes, and on the platter some wood-rat stew with poplar buds on the side. For a relish a seal oil salad of brake sprouts. For dessert a handful of spice cranberries picked on the spot, and for luxury a cup of hot tea without sugar or milk, and flavored with nothing excepting the sweet, pure, strong wind that almost puts out the fire of willow sticks.

ROBERT T. MORRIS.

NEW YORK, March 25.

## Baron Martin von Schlosser.

MEYERS FALLS, Washington, March 12.—*Editor Forest and Stream:* In FOREST AND STREAM of March 5, it is said the above named baron was killed by a bear in the Olympic peninsula in the State of Washington. The announcement is not true. The baron has turned up alive and well. Some one, maliciously or some other way, gave circulation to a story that may cause nothing but panic or harm.

## Natural History.

### The Winter Whitening of Animals

Editor Forest and Stream:

An editorial on the above in your issue of December 26, 1903, is one of much interest to lovers of nature. Some of our scientists ought to take hold of this subject and give us an explanation of the true cause. Capt. Barrett Hamilton's theories on the matter, "atrophy of the pigment cells due to fatty deposits," do not appear to me to be well founded, in fact quite the opposite of what I have observed during many years of trapping. To begin with, I will take the three best known species of our fauna that undergo a complete change: the hare, weasel and ptarmigan (willow grouse). The two mammals above named are remarkable for the total absence of fatty tissue on their bodies, and when they do have a little it is only a small streak on the back, from the neck to the shoulder blades, which, strange to say, is the part where the dark color of the fur is retained the longest in the fall. On the underparts where they never have any fat, the color remains white all the year round. Ptarmigan are in their primest condition about the end of August, at which time they have their finest summer plumage. After that period, berries, on which they have fattened during the summer disappear, and the birds are forced to subsist on the buds of the willow and other shrubs. They then lose flesh gradually until the end of October, at which time they have assumed the white plumage of winter, and have not a particle of fat on their body anywhere. The tail feathers that are deeply seated in the fatty rump and near the oil glands remain black at all seasons. If this whitening process of the fur or feathers were due to accumulations of fat, such animals as the bear, beaver, porcupine, skunk and others would turn white, as in the fall of the year all these animals have a heavy coat of fat on them.

The young of the Greenland seal (*Phoca groenlandica*) are born white; at birth they are very lean, but soon accumulate fat, and at the end of from five to six weeks are just one solid lump of fat, when the white coat is shed and the dark, mottled color is assumed, just at the time that the quantity of fat is the greatest! The Greenland seal deposits its young on the ice in February. Another species of seal (*Phoca vitulina*) also is born white in the same lean condition, but this white coat is shed the same day, within a few hours, and sometimes immediately after birth, and the dark color taken. This last species deposit the young in June. Here we have two mammals of the same family, one giving birth to its young in winter, which retains its white color till the spring, or until such time as the influence of the sun's heat is felt. The other depositing the young in summer, when the white color is immediately thrown off. Would not this seem to indicate that cold is the chief factor and has more to do with coloration than fat?

The back of all northern mammals, as a rule, is darker than the underparts, being most exposed to the sun's rays, while the other portions in contact with the cold or damp ground remain paler or white. The fur of the hare and weasel and the feathers of the grouse may also be more susceptible to cold than those of other animals or birds, owing to some peculiarity of texture and the pigment cells therefore more easily affected. It is a well-known fact that hares and weasels begin to change color earlier on the high ranges than they do near the coast line, but in each case only after the first frosts, and gradually more so as the cold increases. In mild seasons the change comes later than in early ones, showing that there is no fixed time, all depending on temperature. Another important fact worth noting, and of which Capt. Barrett Hamilton says nothing, is that the skin of the animal undergoes the same changes, being dark in summer and white in winter.

NAP. A. COMEAU.

GOBOUT, Feb. 17.

## Hawks and Owls.

Editor Forest and Stream:

Your long-time contributor, Old Sam, whose name I was glad to see once again in FOREST AND STREAM, writing in your issue of Feb. 27, made a vigorous attack upon the whole tribe, or tribes, of hawks and owls, stigmatizing them all as habitual murderers of game birds and domestic fowls, and damning them without discrimination as enemies of society, both human and feathered.

The pretty and interesting little "toy" owl, commonly called screech, comes in for the largest share of odium, and is made to appear as an ogre, with a large capacity for devouring his fellow creatures.

The inference to be drawn is that unless these destructive marauders have speedy punishment meted out to them by present execution without benefit of clergy, there shall soon be neither game birds nor chickens left, when the murderous hawks and owls must perforce all starve to death.

Your correspondent gives a number of concrete examples wherein the culprits were taken in *flagrante delicto*, concerning the truth of which no doubt is intended here to be implied. But the contention is made that these instances were exceptional, and do not mark the rule of conduct of the hawks and owls.

I think a little reflection would substantiate this contention; and a considerable volume of negative testimony can be offered in the cause of the defense.

Passing over the positive testimony afforded by systematic investigation of the stomachs of the accused, which show them to be vastly more beneficial than harmful to human interests, as evidenced by the character of the food found in their stomachs, let us take up the evidence of a negative character.

Every sportsman must have noted that in the pursuit of partridges (*virginianus*) he has found the same coveys on the same ground throughout the season, the numbers of birds not appreciably diminished, except by his own gun or those of other sportsmen, notwithstanding the presence of numerous hawks in the neighborhood, who are not infrequently engaged in hunting the same fields as the sportsman, but evidently

for different game. Now, suppose that the hawks relied solely, or mainly, on partridges for their food supply, how many birds would be required to supply the demand? Each individual hawk would devour several hundred birds in the course of a year, and the supply of partridges could not last a twelvemonth.

It is also a fact of common knowledge that where guns are kept out of the fields for a few seasons, there is a marked increase in the number of available birds for the sportsman's purposes, notwithstanding the presence of numerous hawks.

It is doubtless true that before man came upon the scene, and interposed his meddling hand in nature's world, both hawks and game birds were far more numerous than now, and nature, unaided by man's devices, managed to maintain a fairly constant balance between them.

The writer has spent the greater part of his waking hours during half a century in the woods and fields, and has seen hawks as well as owls in familiar association with most of the varieties of birds of this country, in-

cluding some of the game birds, without any manifestation of fear on the part of the birds, or of murderous intent on the part of the hawks. The occasions have been very rare when an attack upon any kind of bird by a hawk has come under my observation; and I have never yet witnessed an attack by a sparrow-hawk upon any kind of bird, though much familiar association between them is a matter of every-day observation. I once saw a shrike hammer the life out of an English sparrow, and I saw one of those misanthropical birds making persistent pursuits of a brown thrush, evidently with murderous intention; but bird tragedies of the kind named have been exceedingly rare in my experience.

When a pair of hawks have builded a nest and are rearing a brood in the neighborhood of a farmyard, if there are young chickens conveniently to be had, they will rely to some extent on that source of food supply for their young ones. This very natural conduct of the hawk parents has brought upon the heads of all hawks anathema from the farmers and their wives.

But the per cent. of loss to the chicken industry from this cause must be very small.

When man essays to regulate the affairs of nature's domain by interposing his own destructive hand, except for the elimination from his vicinity of such creatures as his interests obviously demand the removal of, he is pursuing a blind and generally a vain course, and being ignorant of the hidden inter-relations that exist between the wild creatures, with the checks and balances that nature has set up among them, one upon the other, man's interference is most likely to cause disastrous effects to all concerned, though he may not be able always to discern the relations of cause and effect, as the result of his actions.

Moral: When you raise your hand to destroy any of nature's children on suspicion of its being an enemy to man, if there is a doubt about its guilt, give it the benefit of the doubt—if you have made a mistake in so doing, it is not an irretrievable one—but life, once destroyed, can never be recalled.

MISSISSIPPI

COAHOMA.

## The Florida License Law.

FORT ORANGE, N. J., March 25.—*Editor Forest and Stream:* I have been in Florida since January, and have heard so many complaints from so many different sources, in fact hearing them from every non-resident with whom I have spoken on the subject, that I think it quite time to put these ideas in print, to see if, in a measure, a compromise cannot be effected to the satisfaction, and also to the best interests of all concerned.

I have been warned to keep my finger out of this "political pie." I have been told that the present system of fish and game laws was a pet scheme of Senator Frank Sams, of New Smyrna, in which he was very ably assisted by H. M. Flagler, our east coast railroad magnate. How true this is I, of course, do not know; but until it is proven to me I shall not believe it; for, if they deserve their present reputation, they could never be guilty of short-sightedness sufficient to put into force a system of laws which so bitterly dissatisfies every visiting sportsman.

There are about twenty-five to thirty States in the Union that charge non-resident hunters a license fee. Florida excepted, the sums charged range from \$10 to \$40, Wyoming being the highest and Pennsylvania the lowest. The sums mentioned entitle the holder of the license to shoot upon every foot of wild land within the borders of the State by which the license was issued. These sums are not extortionate; no fault is found and no difficulty is experienced by these States with their non-resident brethren. But what of Florida, the winter hunter's paradise, and the saviour of the Northern invalid, the State of all in the Union where the non-resident should be treated fairly, and encouraged to travel over the entire country? What of Florida's game laws? Simply this, and when you consider the situation as a whole, and study the laws from beginning to end, they are everything but simple. There are forty-five counties in the State of Florida, forty-four of which charge \$10 each to the non-resident sportsman for the privilege of hunting only within the borders of the county issuing the license. It is a county affair in Florida, and costs \$440 for shooting in forty-four counties of the State in the same season; and as to the forty-fifth, LaFayette county, if one shot there this entire year it would cost him \$366 for so doing, or if you shot in that county through the regularly prescribed open season of four months it would cost you only (?) \$120 for that county alone.

Again, one is not allowed to carry game across any county line. He is not allowed to take his legally killed and dearly paid for game to any place within the boundaries of the State, as he would be in any other State in the Union. Considering these laws, do you wonder that all non-residents call them an outrage and an imposition on themselves, and a reflection on the fairness and common sense of the Florida citizen? This may be harsh criticism, but can anyone say that it is not, at least in a measure, a just one?

Why not make this a State instead of a county affair? Why not charge a license fee which is reasonable and within everyone's means, and let the license issued cover the whole State? It is easily seen how such an act would benefit Florida, and the railroads and steamer lines in particular.

A great many more sportsmen would come here to hunt, and, not being satisfied with a certain locality, would go from place to place, hunting in them all; thereby not only using up a great deal more time, but a great deal of money as well, and all because one license would cover this entire trip. Is it not easy to understand how beneficial this additional circulation of money would be? I will venture to say that there isn't a single non-resident in Florida at this moment who will not agree with every word I have said, and a majority will add more to it and make it all the stronger. Everyone, of course, knows that ninety per cent. of our sportsmen here do not buy a license to hunt, but it is a well-known fact that if a State license law were

adopted seventy-five per cent. of this same number would gladly pay \$15 for the privilege of shooting where he pleased within the borders of Florida. Therefore, there is nothing that the citizens of Florida can do which will be of such material benefit to the State as a whole as to put this hunting industry in the hands of State officials, and empower them to appoint a head game warden for each county, together with deputies sufficient to the demand of complete protection, something which at present is not known in any part of the State. Charge \$15 for a license to cover the whole State. Make all the wardens and deputies State agents for the licenses, and answerable for either the sale or return in good condition to the State Game Commission, and have the money realized by the sale of licenses paid into the State Game Commission, and paid out by them for wardens' salaries and other necessary expenses for the protection of the game, under the supervision of the governor and council.

There would not then be the temptation to hunt without a license that there is to-day, and even if one were tempted to do so the protective system would be so complete as to render such a thing an impossibility. Under this system the game would thrive as it does in other States, the hotels and railroads would be much better patronized, and, above all, the patrons would be better satisfied and more willing to call again.

There is a great deal more that can be said upon this subject, but I shall wait for a reply to this before putting the rest in print.

S. FRED CUMMINGS,

Licensed camp-owner of Square Lake, Maine.

## Wolves and Forest Reserves.

*Editor Forest and Stream:*

In Mr. Anderson's letter on "Wolves and Forest Reserves," published in the issue of Feb. 20, Mr. Anderson makes such astounding statements, that I cannot let them pass unchallenged.

Mr. Anderson intimates that my remarks were intended to stir up opposition to the Yellowstone Reserve. I can assure Mr. Anderson that I am, and always have been, in favor of the reserve, and did what I could to help to have it established. But a little plain talk on the situation seems needed.

Mr. Anderson says that there is no decrease in the number of settlers by reason of the reserve. The best answer to Mr. Anderson is found in the fact that wherever one goes on the reserve are found abandoned ranches, tumble down fences, filled up irrigation ditches, and deserted houses on which appears the notice, "This building has been taken possession of by, and is the property of, the United States, all persons are thereby warned against trespassing thereon."

Some time before the present Yellowstone Reserve was established, FOREST AND STREAM published my ideas on the subject. I then pointed out that northwestern Wyoming, on account of its cold summers, was a hay and cattle country; that at least 320 acres was necessary to make a ranch that would support a family; and that without the grazing rights on the range, the ranches were valueless. I also suggested that no considerable bodies of agricultural land should be included in the reserve, and that care should be taken not to interfere with the rights of settlers. Had my suggestions been followed, the present situation would have been avoided.

Ten years ago, Northwestern Wyoming was practically unsettled, and the bulk of the settlers have come in within the last seven years. Owing to the distance from land offices, the difficulty in getting witnesses, and the expense, it was the custom among the settlers to put off filing upon their lands as long as possible. As each settler was allowed a homestead of 160 acres, and a desert claim of the same amount, and as a desert claim must be brought under cultivation and final proof made inside of four years, while seven years was allowed on a homestead, nearly every settler located his

desert claim on the land easiest reclaimed, taking the poorest part of his ranch for the homestead.

While this condition of affairs existed, the Yellowstone Reserve was established, and every settler who had not filed his desert claim was out the best part of his ranch. Many left the country at once, others are now engaged in an almost hopeless endeavor to get a title to their lands. In addition to this the reserve was established in May, and it was late in July before any definite information as to the reserve could be obtained. During this time many settlers had located ranches. These last were promptly ordered off the reserve, and their improvements confiscated. It is estimated that in northern Uinta county, which comprises that part of the reserve directly south of the Park, 30,000 acres of first class hay land would now be under cultivation, had the settlers actually on the land at the time the news of the reserve had been established was made public, been allowed to remain.

If Mr. Anderson is ignorant of these facts, it is but additional proof, were such needed, of his unfitness for the position he holds. And I am informed, that on the eastern side of the reserve the situation is much the same. At any rate, the people over there are kicking up an awful row.

As to Mr. Anderson's statement, that the same amount of stock is on the reserve, I challenge him to publish the amount actually allowed on the reserve as against those kept off. Last summer tens of thousands of acres of grass went to waste, though the stock was ready to eat it, and this winter thousands of tons of hay have been sold for the cost of putting it up, or are rotting in the stacks, simply because the stock cannot be summered on the reserve. I expect to burn 200 tons of standing hay next fall that should be worth six dollars a ton; and on hundreds of acres of land I shall not even turn the water, because of Mr. Anderson's management of the reserve.

The people of Wyoming are not opposed to forest reserves. A very large majority in this part of the reserve asked that it be established. But they had no idea that hundreds of thousands of acres of valuable grazing and hay lands would be included, or that settlers actually living on the lands would be removed. The people of the State have demanded, through the governor, that Mr. Anderson be removed, and a competent man put in his place.

Making a royal progress through the reserve during the summer months, attended by a retinue of would-be bad men loaded down with firearms may be impressive, but it is a mighty poor way to administer a territory larger than many eastern States.

The wolf question is a very important one to the stock raising States. During the last ten months Wyoming has paid \$40,000 in bounties on wild animals. In addition nearly all the stock associations and large stock ranches pay bounty of from \$10 to \$20 for all wolves killed on their range. In Montana, last year, 26,000 sheep were killed by wolves. A conservative estimate of the losses in these two States caused by wild animals puts the total expense to the stock men, including bounties, at half a million dollars a year. In the face of figures like these, Mr. Anderson's "number of wolves killed by the ranges," and "pack of dogs for hunting mountain lions upon the reserve," are rather amusing. I have been hunting lions with dogs for seventeen years, and have killed several hundred, but never could see that the stock on hand decreased much. As to the reserve becoming a breeding ground for wild animals here are the facts: Here is a great tract of mountain country, thinly settled, and intended to be kept so. It is well stocked with game to furnish food, and every attempt is being made to have as little hunting done thereon as possible. The cougar are already there; and the wolves have found out its advantages and are coming in in droves.

The large bounties are not paid on wolves killed on the reserve, and the State bounty is too small to tempt trappers for that alone. In addition, the State, urged

thereto by the L. A. S. who might be better engaged, has prohibited the trapping of bear and martin on reserves, thus further discouraging trappers. I stand by my statement that the Yellowstone Reserve, as now established and managed, will be a breeding ground for predatory animals and a menace to the stock interests of the surrounding States.

With the boundaries restricted to the actual forest and mountain lands, and with a man in charge well informed as to actual conditions and who possessed the respect and confidence of the people, much might be done. As it is, the situation is bad. A heavy blow has been struck at the development of Wyoming, and very little good accomplished. The forests could have been protected just as well with a much smaller reserve. These forests are mainly of large pole pine, are of very little commercial value, and were in no danger until railroads came.

Nothing has been done toward the main object of game protection, to save the larger males, so as to provide trophies that are worth going after. I see that Buffalo Jones is quoted as saying that the small proportion of big bulls to cow elk is caused by the cougar preferring bull elk meat. I never noticed that cougar preferred bulls; most of the elk I have seen killed by cougar were cows and calves. But I noticed that the following prices were offered: Bull elk scalps, \$8 to \$15; bull elk tusks, \$2 to \$5 each; mountain sheep scalps, \$3 to \$8; and from \$50 to \$500 for extra large elk and sheep heads. And if anyone thinks that no elk and sheep are killed at these prices, they are mistaken. For the next two months is the hunters' harvest. The big bulls and rams are weak and are bunched in sheltered places.

I can leave home to-morrow morning and, before night, can have a hundred dollars worth of elk tusks in my pocket, and in a month can have a thousand dollars worth of heads cached, ready to pack out in the spring, and no one the wiser. And I don't know but what I might just as well do it.

Mr. Anderson is in New York telling what great things he has done, and is going to do toward game protection, and if I don't get the heads and tusks, some one else will, so what is the odds? WM. WELLS.

WELLS, Wyo.

## New Hampshire Bears.

Editor Forest and Stream:

This State pays a bounty of five dollars on bears killed within its borders. During the last two sessions of our Legislature, efforts were made to repeal the bounty. As I understand, the opposition which defeated the repeal came from men living on or near the bear regions.

In many parts of New Hampshire, north of Plymouth, there is a fair number of bears, and they know how to take care of themselves.

My experience in hunting bears has been rather limited. I have seen in all (when wild and free from traps) ten black bears. Of this number, I shot at five; one at long range, which I missed, and four at close quarters, which I killed. I also assisted in the killing of four more. I never had a chance to follow an unsuspecting bear on a good still-hunting snow. I did follow three which had been started; one from its winter den under a fallen spruce. The recollection of the rough ground over which those bears led me, and the very slight chance of even getting a sight of them, cured me of all desire to again attempt to still-hunt a bear which had been started.

Occasionally a bear is found in its winter den. I have seldom heard of one being tracked there. It is said that when a bear retires to winter quarters he usually does so at the beginning of a snowstorm, and leaves no trail.

The easiest instance of finding some bears in a den that I know of happened to a member of a party I was with. During the latter part of November, 1900, two of my neighbors and I were hunting deer near Stinson Lake, in Rumney, N. H. There had been a snow fall of several inches, followed by a thaw. When we reached the hunting grounds we found about an inch of crusty snow. On this snow one of our party found the trail of two bears quite handy to our camp. The tracks were old and, in places, hard to follow, and evidently were made before the thaw. Few men would have thought it worth while to follow such old bear tracks. The man who found them is a powerful young fellow, a natural woodsman and hunter. Previous to that year he had never hunted anything larger than a fox. He wanted very much to kill a bear, and had said that should he find the track of one he would follow it a long time. He followed those tracks about half a mile to a hole in a ledge near the top of a mountain. A wide circle was made around the ledge, and no outgoing tracks found, the hole and several other holes in the ledge were tightly plugged. The following morning we all went there to investigate. We found and killed four bears, an old one and three good-sized cubs.

A good many bears were seen last fall in the vicinity of this den. Ten were shot (no trapping), and some shot at and missed. About four miles north of the den, in the town of Ellsworth, is what is called the Wallace Place. Here are several deserted farms and the remains of some buildings, and also quite a number of apple trees. Last season the berry and nut crops were failures. In some places there were apples, and the Wallace Place was favored. Bears came frequently to those trees. Eight were shot there; seven of them when either on or under apple trees. I heard of some instances connected with the shooting. At the upper end of an old road leading to Wallace Place is a barn. A party of three, two of whom had repeating rifles, were watching from the barn. A bear came to an apple tree some thirty yards away. The men opened on him. One fired all the cartridges his rifle held, and the other pumped out five without pulling the trigger, and the bear departed, unharmed.

As to protecting bears by a close season and other restrictions, a New Hampshire bear does not need any protection from the man who hunts him with a gun, and I think the same applies to other regions. For every bear shot, ten are trapped.

I have hunted in some parts of New Hampshire, Maine and Nova Scotia, where there were bears. I spent some time cruising about. I never yet have seen a bear (except those in the den) when I was looking for one. Those I saw I ran across when hunting for other game.

Last October was an exceptionally good time to get a shot at a New Hampshire bear. With practically little or no food for them in the woods, they hunted up places where there were apples, and the chances of getting shots were very much better and easier by watching such places for an hour or two in the early morning or late afternoon than to cruise about in the woods.

C. M. STARK.

DUNBARTON, N. H., March 24.

## The Boy and the Gun.

Boston, March 24.—Editor Forest and Stream: In your last issue, I noted with a great deal of satisfaction the editorial relative to Senator Armstrong's proposed bill for a license in the carrying of firearms, and also absolutely prohibiting the use of firearms by any person under the age of eighteen.

I agree with you heartily in the position you take, for while the bill would not affect me or my family in any way, yet my own experience has been such, and the satisfaction of following out the ideas as outlined in the editorial has been so great, that I wish to express my thanks for the broad position you take in this matter.

I have a son who is now thirteen years of age and who, from the time he was six years old, has been in the woods with me each year from two to three months at a time, and who has been plainly taught to use a rifle, and with such success, that even he feels the responsibility, and is better able to handle a gun, with a proper knowledge of its uses and also with a proper idea of the possible disastrous consequences which might arise from the misuse of it, than a great many people who have arrived at the voting age, and who never knew the value of early instruction. I venture to say that a gun in his hands, is safer than in the hands of many so-called sportsmen, who go into the woods late in life, and when they are supposed to have arrived at the age of discretion.

Nearly all of the accidents which happen from shooting, and at something you never see, are due entirely to the fact that the gunner had not been brought up in his youth to a proper appreciation of the importance of knowing how to handle a gun, and not take chance shots; had such instruction been given, many of these accidents would not occur.

Very rarely do you find in the woods a man with his son, and more is the pity. Not only is the boy benefited by his early experience and the knowledge he acquires from the love of nature; but the man who has not been in the woods with his son can have but little appreciation of the pleasure that one gets with his boy, whom he can make his chum when all others fail. One who has yet to experience the full companionship of a bright, healthy boy in the woods, would find, if he ever tried it, that the boy would see more to interest them both in one day, than the pater could in a month. I think one is to be pitied, who has failed to experience this feeling of companionship that comes from bringing a boy up in this manner. Leaving aside the healthful benefits which would naturally accrue from these experiences, we must not fail to consider the moral effect that it has on a boy's mind. No one ever saw a boy brought up in the woods who was not better for it; and while this measure may be enacted in New York State, yet it will not be, if the fathers who have sons, and who are fond of nature and the woods, will take into consideration the benefits that they themselves can get from the close companionship with each other and their guns.

Leaving aside this point, is a measure of this kind constitutional? If I remember correctly, there is a certain amendment of the Constitution of the United States, which reads as follows: "A well regulated militia, being necessary to the security of a free State, the right of the people to keep and bear arms shall not be infringed."

Does not this amendment apply as much to guns that are bought for private use, as well as for means of protection? It seems to me that a literal construction of the amendment would imply that a more efficient militia could be organized if the people were allowed to use arms in other ways.

F. A. NICCOLLS.

[As our correspondent doubtless has observed in our issue of March 26, the law forbidding the possession of firearms by boys under eighteen years of age is already a part of the Penal Code of New York.]

## Can Ducks Smell?

Summing Up.

YOUR Honor, since Coahoma, my learned and clever opponent on this momentous question, shows an inclination to come over on the side of the defendant in this action, I am led to believe from this that he has seen the error of his ways.

May it please the Court, and if it will be good enough to bear with me a few moments, I will recite the true history of this Limburger case.

I was acting as chairman of a meeting of business men some years ago, when, because of friction and other things that sometimes arise at such meetings, the atmosphere became decidedly inharmonious. There was a lull in the proceedings, caused by the necessity of waiting for some records that had been sent for. How to throw oil on the waters I did not know. Seated among the rest was a bewhiskered Teuton, with whom I had gone duck shooting once. I remembered the trip, because he and his friend had eaten Limburger that day for lunch, and had borrowed my favorite hunting knife with which to open the can. (I boiled the knife in lye afterward before I could make use of it.)

Well, the Limburger tin thrown carelessly on the pass flashed into my mind, and I then and there made

the story of the wayward mallards and told it in the crowd. They listened attentively, many of them being sportsmen; and I had a no more attentive listener than the Teuton referred to, who had been on the trip with me.

As I got along in my story I could see now and then a gleam of intelligence scintillate through his whiskers as if he recognized some earmark familiar to him in the story. And, as I expatiated on the hypersensitive ducks, and described how they went to the right and left and far over our heads out of gun shot, and how I buried the tin, and how the shooting once more instantly improved, I could see him grasp the handles of his chair and with much self control hold himself down. But as I finished the story and told how I dug up the buried tin, and how they admitted that the tin where it was exposed "smelled" off the ducks, and there finished my yarn, he flew out of his chair and fairly yelled, "I vos dere myself, already! You vos de tamtest liar in tree states! So!" and at once the whole room burst into a fit of uncontrollable laughter at his own "give away," and the button was pushed and the liquid refreshments were on him, and no mistake. The story did the work. The oil—or Limburger—turned the meeting into harmonious paths and all went well and peace reigned.

And that, your Honor, makes me think of a story. A fisherman stopping at the farmhouse of a well-to-do and educated German, referred to the inability of the average German to appreciate an American joke. Yet the American was quick to catch on to any of the jokes given out in the *Fliegende Blätter* and other German comic publications. The German disputed this statement, and said, "Germans were just as quick to understand a joke as anybody else."

"Well," said the fisherman, "here's one. We had down in our country a farmer with such big feet, that when he went to bed nights he had to go out into the forks of the road and use it for a bootjack to pull off his boots."

The German never cracked a smile.

"I told you so," said the fisherman.

"Wait a minute, just," said the German, "so I see vedder I you understand correctly. You say dot you know a man vat makes a bootjack already of de forks of de road to pull mit his boots off, he such big feet got?"

"Yes," said the fisherman.

"You mean by de forks of de road vere de road, one goes dis vay and de odder dat vay, a fork making?"

"Yes."

"And he go out dere and his boots he must pull off like a bootjack he use?"

"Yes."

"Vell, I understand, don't I? Vat?"

"Yes."

"Oh! den, dat no joke vas, dat vas chust a tam lie."

CHARLES CRISTADORO.

## The Adirondack Deer Supply.

ALBANY, N. Y., March 28.—Editor Forest and Stream: In justice to the general public, the hotels and guides of the Adirondacks, and to the railroads traversing the region, I consider it my duty to refute the numerous unreliable statements that have been printed in the newspapers from time to time to the effect that on account of the unusually cold weather during the past winter the deer of the Adirondacks are becoming a thing of the past.

This department has been kept advised daily by a reliable class of men, who have been on snowshoes visiting the principal deer yards since the first statements were made early in the winter that deer were suffering unusually; and we can truthfully report for the benefit of all persons interested, that there is no foundation for any such statements. People who frequent the Adirondacks during the summer and fall will see fully the usual number of deer as in past years, and will find the fall hunting as good, if not better.

Protectors Emery Kinsman, who is located in the northern portion of Lewis County, and B. H. McCollum at Edwards, St. Lawrence County, have spent no little time in the woods, and especially in the vicinity of Cranberry Lake and the middle branch of the Oswegatchie River, where deer are very plentiful. Protector E. H. Reynolds, of Colton, has spent the principal part of the last two months along the Raquette River, circling either way into the forest as far south as Tupper Lake. George Selkirk, of Duane, Franklin County, and Isaiah Vosburgh, of Saranac Lake, have been equally busy visiting on numerous occasions the principal deer yards in Franklin County. Protectors R. B. Nichols, of Indian Lake, and Joseph Grenon, of Raquette Lake, have covered the northern portion of Hamilton County thoroughly, and the same is true of Frank E. Courtney, of Wells, in the southern portion of that county and down into Fulton County.

Alvin Winslow, of Stoney Creek, Warren County, and C. T. Barnes, of Olmsteadville, Essex County, have been watchful over the territory they are supposed to look after, and the same is true of N. A. Scott, of the northern portion of Saratoga County, and Charles A. Klock, of Fairfield, Herkimer County, whose territory not only covers the southern portion of Herkimer County, but extends through into Fulton County, and the reports of these several protectors are to the effect that scarcely any dead deer have been found. The north parts of Essex and Clinton counties are taken care of by Protectors F. S. Beede, of Keene Valley, John Weir, of Dannemora, and J. F. Shedden, of Mooers, and they make no report of finding any dead deer. The snow in that portion of the Adirondacks was not so deep as in former years.

Protector H. N. Gaylord, of Turin, in the southern portion of Lewis County, has been very active, and in company with assistants has taken in all that portion of Herkimer County from the head of Fourth Lake to the south branch of the Moose River, following the river and making large circles either way down as far as deer inhabit, and going also through Beaver River country. He reports that on that extended trip by the aid of two trappers, who were located remote from any settlement, twenty-eight dead deer were found. In the territory that

he covered it is safe to say that there are from two thousand to twenty-five hundred deer.

Dead deer have been found in past winters along Moose River, and some eleven years ago the mortality was quite large. The dead deer found were nearly all late fawns and old deer, bucks principally. Everyone knows that deer lose their teeth at about the same age that sheep do, which naturally makes them unable to live on coarse browse, and it is a fact that the bucks that roam over a large territory during the rutting season are not in as good condition the first of January as other deer.

Since hounding was abolished deer have been on the increase rapidly, and as the south branch of the Moose River for many miles is too far remote from still-hunters to make it profitable getting their deer to the settlement, little hunting is done in that locality as against the time when the hunter went there to start his dogs and drive the deer to the larger bodies of water, where, if killed, they could be gotten to the settlement quite easily.

All of the protectors referred to, and many interested guides, including the Brown Tract Guides' Association, have devoted much time in the felling of trees suitable for deer to feed on.

On the 6th and 7th of February there was a thaw which formed a crust sufficiently strong to hold a deer, which enabled them to leave their yards and to reach higher for browse and moss, which is their entire living through the winter.

There is no question that the feed along the south branch of the Moose River consists too largely of balsam, which is weakening to any animal, but many deer naturally congregate in that vicinity, as there is more or less open water there; and there is no doubt the same instinct in the deer to-day that there was thirty years ago, when wolves were numerous and they yarded in the vicinity of some rapids or open water where they could plunge in and keep away from the wolves.

I hope that this statement, which is gathered from the facts as they exist, will be good news to all interested in the Adirondack deer.

J. WARREN POND,  
Chief Protector.

### Game Birds for Stocking.

GRAND FORKS, N. D., March 21.—If you would take up the subject and advocate the enactment of laws in the different States relative to giving permission to take game birds and animals from one State to another during the open or closed season for propagating purposes I believe a great good would result from it.

This is one of the good features of the "Lacy Law," but it is inoperative when it conflicts with the game laws of a State.

It has been an oversight, I think, in most of the States in not providing for this in drafting game laws. It is my desire to experiment to a limited extent with quail in North Dakota. I am confident that they will thrive in many parts of the State, but have encountered the difficulty of securing them from some of the northern States on account of their game laws not permitting the birds to be taken out of the State for propagating purposes. This certainly is of mutual interest, and an interchange of game birds, when they have become scarce or extinct, or bringing into a State game birds not native and such that would in all probability thrive and multiply by having proper protection under the game laws of the State, is of interest to every sportsman and citizen of their home State. Laws permitting this should be made stringent and such that could not be abused. This could be easily done by having the birds or animals shipped through the proper parties in authority, whose duty it would be to see to the correct distribution of the same.

CLARENCE A. HALE,

State Game Warden, District No. 1.

[If Mr. Hale will refer to our issue of March 5 he will find there an editorial urging this very thing.]

### Spring Duck Shooting.

EAST END, Long Island, N. Y., March 28.—*Editor Forest and Stream:* Mr. W. E. Hookway is on the right track in your issue of March 26.

I do not believe in spring shooting, and I do not agree with Mr. Hookway that this spring shooting law is especially for the rich man; but I do know it hits the poor man in this section. January and February are the months he can best gun, and the season when work and,

consequently, food are hard to get. This class of shooters work hard for a "mess," and do not break any spring shooting law.

Two ways to protect game. First: "Forbid shooting;" second, "Limit the bag."

The first would be fought by all who love to shoot. The second, by owners of game preserves and market hunters.

We must strike a happy medium. A law that will be respected by the greatest number of shooters.

Such a law, I think, would let us shoot in the fall and winter. Not later than March 15 on Long Island. If the birds are still on the decrease, "limit the bag," or shoot every other week during the above season, and forbid the sale of game. But don't pass a law then not respect it.

I am also secretary of an organization for the propagation and protection of game.

D. C.

### Game on the Border.

ENOSBURG FALLS, Vt., March 19.—We very much fear that the heavy crust that has formed on the snow has killed most of our ruffed grouse. Recently during a long drive through eastern Canada we only saw one grouse track. On the 11th inst. we saw, nearly sixty miles north of here, a robin, and he appeared as lively and pert as in early May, and the whole country was alive with crows. Deer are quite numerous all along the frontier, and foxes have been, and are still, very plentiful. Quite a number of bay-lynx have been killed in this vicinity, and but a short distance north in Canada there is a small pack of wolves—an old she and two or three yearling whelps. The catch of coon and mink has been a large one, and their pelts have been well furred. Up to date we have had over one hundred days of continuous sleighing and forty-eight days the temperature has been at or below zero. A record winter for cold weather.

STANSTEAD.

"There are some things," said the philosopher, "that money cannot buy." "I suppose so," answered Senator Sorghum. "But that doesn't alter the fact that there is an almighty lot of things that it will buy."—Washington Star.

### Random Casts.

How times change and we change with them. Many old residents of New York city can remember when there was plenty of free water on Long Island; now all the streams and ponds are owned by clubs or individuals, who close them to the public. Trout were found to be in good condition very early, as Long Island enjoys a comparatively mild climate, owing to the proximity of the Gulf Stream. I believe that at one time the season opened on the first of March, and even now, the law allows trout to be taken on the island two weeks or more earlier than elsewhere in the State. The fish which had access to salt water were celebrated for their fine quality, and may be still, I do not know. Of course, the conditions in our mountain streams are very different; snow is usually found in the woods until the end of April. I have seen it on the slopes of the Catskills early in May. The nights are very cold, and the rivers often too high for good fishing. May and June are the angler's favorite months, and the thirty days from May 15 until June 15 his harvest time. In fact, any one who is master of his time would in all probability kill more trout between the dates named than in all the remainder of the season. There are usually a few days or a week of really fine fishing. The trout in this golden week seem to be innumerable, and if one can strike upon the right day and the right fly, a heavy basket will be made. It is not easy for a business man to time his visit so as to enjoy the best fishing of the year, as the few days I refer to may come at any time from May 10 to the middle of June. Our climate is a very uncertain quantity, and the seasons vary greatly from year to year. It is really very puzzling to note the great numbers of trout at this season. They have a way of disappearing suddenly a little later when the hot weather begins. A few schools may be found at the mouths of cold brooks, but where thousands were, a few hundred at most remain.

What a fortunate thing it is that the equipment of the fly-fisher is so interesting and attractive! How much pleasure one has in hours of ease fussing over rods, flies and tackle. This is particularly the case where trout are shy and only the smallest flies and filmiest casts can be used with any prospect of success. I believe that the importations of the best work of the English fly-maker have been larger this year than usual, and I know that there has been a large increase in the number of dry fly-fishers. Even in Maine, the fashion has changed, and small flies were quite the rage last season. It was formerly the custom to use patterns dressed on hooks as large as No. 2, old style, for the big trout of the lakes; but now we hear of 8, 10, 12, and even smaller sizes. I have noticed that these hooks are favorites on the Scotch lochs and for sea trout fish-

ing in Scotland and Ireland, and have been so for years. There is no doubt, however, that at times, if you want big fish you must put up a big fly. Large brown trout particularly, which have taken to a fish diet, will not be attempted by any infinitesimal insect. I remember locating one of these busters some years ago, when the water was very low in the stream I was fishing. It was a fine big pool, and I worked at it faithfully many times and oft without moving the big chap, though I took a number of smaller fish. One afternoon I tried every fly I could think of, ending with several of Holland's floaters (after pointing my cast with three lengths of his cobweb gut). Nothing was any good, and I sat down to think about it. Turning over the leaves of an old book, I found a whacking black bass fly which I had tied on a Pennell eyed hook. What a fool I was! Just for something to do, I knotted the end of the cobweb gut to the big metal eye and cast the fly out where the smooth water began, near the head of the pool. As the hackle was heavy and put on dry fly fashion, the fly floated beautifully and looked like an enormous moth trying to fly. There was a tremendous splash, and out sailed the big chap with the fly in his mouth. The gut, fine as a woman's hair, and tied to thick iron, popped at once, and I was left lamenting. This was on hard-fished water.

It is a curious fact that one sometimes finds wild trout that have seldom or never been fished for as shy and hard to take as it is possible for fish to be. I remember a pool in a perfect wilderness that was simply alive with trout; they could be seen in companies and regiments, but two or three fish only could be taken at one time. The hundreds remaining were alarmed by the struggles of the first fish that were hooked, or else realized that the flies were not the real thing. There are streams in this country where the trout are not in the habit of seeking food upon the surface, and these are wilderness rivers also, usually situated in heavily timbered, mountainous districts. I fancy that some of these waters do not produce natural flies at all. I have fished brooks in hemlock forests, where the trout were said never to rise until the month of July. Two friends and myself traveled several hundred miles to reach one of these, not being aware of this peculiarity. We had expected great things, as an official of the railroad had given us wonderful accounts of the sport to be had; and we were sadly disappointed. A good basket of fish was to be had with bait by going up stream about eight miles, but we were fly-fishers, and had been dreaming of this trip for months. However, on our way home, we stopped off at Lockhaven, on the Susquehanna River, for a good night's rest, as we were extremely tired. Next morning we were sitting in the reading room of the hotel, feeling anything but happy, when the landlord joined us. After

questioning me as to our sport, he asked if we were good fly-fishers, and was answered (modestly) in the affirmative. He then said that an excellent hotel had just been opened for the season at Bellefonte, in the Bald Eagle Valley, and that there was good fishing in the stream which flowed through the town, for anglers who were fairly expert. My friends were too much depressed to take this bait; but for many months I had been looking forward to the time when I could enjoy a little fly-fishing. I took train therefor in the course of an hour, and soon reached my temporary destination. I found everything as represented. The hotel was first rate, and I was the only guest. Meals were served at all hours, and everything possible was done for my comfort. The stream was large, with numerous dams upon it, and held a large stock of trout. The finest tackle was necessary, and very small flies. It was most important to ascertain the color of the fly the fish were rising at, as, if this could be matched, a fair basket of trout would follow. To give an instance of this, I will relate a single experience. I went up stream one afternoon with a resident of the town to a dam which had been constructed only two or three years before the time of which I am writing. We found that the trout were rising all over the shop at a small ephemera with pale yellow body. This we tried to imitate in vain, and also used all of the flies that were usually most successful. At last my companion found a small yellow dun in one of the leaves of his fly-book, and upon attaching this to his cast, found that he had done the trick. Casting over rising fish only, in a very short time he killed forty-three trout, while I could do nothing. He had no other fly at all like this one. This was many (can it be thirty) years ago, but the experience was useful, and I have never forgotten that trip. It began in discomfort and disappointment, and ended in a week of pleasure, with a fine lot of trout. There may be fish there now. I know not.

THEODORE GORDON.

### Kippewa Fishing and Hunting Club.

THE recently organized Kippewa Fishing and Hunting Club controls a territory of 587 square miles, and holds an option on 400 more. This great territory includes a vast number of lakes and rivers, whose waters abound in lake trout, pike, pickerel, maskinongé and bass with, of course, brook trout in the rivers and smaller lakes. Moose are abundant, and the originators of the club have had good hunting. The largest moose killed there, of which we have heard, measured sixty-three inches across the antlers. There are plenty of deer, some bear and caribou, besides other smaller animals. An interesting feature about the club is its accessibility, since one can go directly to the club house by rail and steamer in less than two days. The limit of membership is sixty,

## With the Gloucester Fishermen.

A STRANGER in Gloucester happening to wander along the many wharves of that busy town during the latter part of March, would be struck by the remarkable activity to be seen, more intense than at any other time of the year. Here two or three vessels on the ways undergoing a final overhauling, there one in the water, with the painters busy on her sides, and the riggers swarming over her deck and aloft, bending sails and standing rigging. Further on, one is moored to the wharf, receiving into her capacious hold all kinds of supplies for the voyage, food for the men, salt, eight or ten tons of it, two or three hundred empty barrels

catch of the season. No time is lost in port, and very often not more than six hours is spent in unloading, getting a few necessary supplies aboard, and starting down the harbor. After the middle of May a seiner is rare around New York. They are then off Block Island, Nantucket and the Cape, their catches are not as heavy and are landed at Newport, and shipped fresh to New York by the Fall River boats. Still later the ports of call are Boston and Gloucester, and T wharf in Boston, and the scores of company's wharfs in Gloucester are the lodestones that draw many a large-fisted, broad-backed and bronzed fisherman on the lookout for a summer on a seiner and several good shares to help along his bank account.

the cost of power, which must be kept up at all times, even though fish are not sighted for weeks. Gasolene auxiliaries have been used in the seineboats to increase the speed in getting around fish, but the noise of the propeller was found to render the fish doubly wild and so the idea was abandoned. Automatic pursers are now used universally in place of the old and slower method of pursing by hand; while balls of prepared salt bait are sometimes thrown in the net to tempt the fish to feed until the seine is pursed, and thus render capture certain. And so it goes throughout every stage of the business. The trade is the same as it was many centuries ago, but the methods are up-to-date in every particular.

SURROUNDING THE FISH.

DUMPING INTO THE POCKET.

and twelve or fifteen tons of ice. Just outside of her, lies a vessel ready and trim for the voyage, a little smoke issuing from her fo'castle, her hatches off, and a few men lounging around her decks with an air of proprietorship, but more below arranging their bunks. These are the crew, eager, after a winter spent in various pursuits and with varying fortunes, to get back to the sea and to the most remunerative and fascinating branch of the fisheries of Gloucester. The captain is up in the office at the head of the wharf receiving final instructions from the firm, and when he comes clambering aboard and the little tug comes alongside and puffs the vessel away, amid farewell shouts of luck and a running fire of jokes and satire between the wharf and vessel, you very naturally turn to the man beside

It was in this latter place that I had the good fortune to get a berth in one of the finest and best equipped vessels in the fleet, schooner *Saladin*, of Gloucester, the highest type of mackerel seiner that has yet been developed. Over 100ft. in length, built for speed and seaworthiness, she has the great advantage over those fishermen which depend on wind alone for motive power, of carrying a 100 horse-power marine gasolene engine, capable of driving her seven and one-half knots, and invaluable during light breezes, when the fish are running. Of vessels thus equipped there are but six, all of recent construction, the rest of the fleet carrying no additional motive power to their sails. Money is not spared in their construction, the cost, fully equipped with engine, rigging, two seine boats and dories, and

In regard to the fisherman himself, current opinion is still more erroneous. Six hours on board was long enough to convince me that here at last had I found the modern prototype of the ancient Norseman. Big of bone and body, with faces weatherbeaten and bronzed by storm and sun, eyes and mouth which gave promise of reserve power to meet any emergencies which might arise in this dangerous calling, dressed in all sorts of old clothes, they formed a picturesque little world of their own, a world which has to do with elemental forces and which leaves the daintier callings of life to those of a less hardy nature. The capabilities of the newcomer for the work in hand is quickly judged, and he is accepted on his merits without any recommendation. If they fancy him it will be a long time be-

HOISTING THE POCKET.

THE CATCH ON DECK.

you and ask the meaning of all this excitement and activity, to learn that the mackerel fleet is fitting out for the season, after having been laid up since last November.

Almost one hundred vessels there are that follow this branch of the fisheries, and the finest in the fleet. Watch them as they stand out of the harbor with all sails drawing well in the fresh southerly breeze, and just enough of a heel to reveal the beauty lines of the underbody. If you are fortunate enough to be aboard, go aloft and mark the speed in the lines of the hull as you look down, stand abaft the lee quarter and see if you can find any dead water in the wake, and you will fall in love with the vessel at once. And after you have gone through a two days' hard blow from the east your admiration will develop into confidence and respect.

Their objective point at the beginning of the season is off the eastern coast from Hatteras to Sandy Hook, and here it is that they hope to be the first to sight "fish," and to make a quick run to New York with a couple of hundred barrels of fresh mackerel, the first

two mammoth seines, worth \$1,000 each, being about \$20,000, and their success in landing big fares seeming to warrant the prediction that all the first-class vessels of future construction will be of the same type.

It is a common impression that the fishing industry is practically at the same stage of development that it was fifty or one hundred years ago, and that the fisherman is a slow and methodical animal, who lacks initiative, and fishes because he can't do anything else. In some branches of the business this may be true, but not of the seiner. No trust manager is quicker to make use of a new idea to increase his income than the modern owner, who is constantly consulting his captains and crews for new ideas that will give him a lead over his competitors. Many instances of this can be given. A few years ago a vessel was launched, built from the drawings of a noted speed-yacht designer, which had an equal carrying capacity, and could sail three knots to two of the older models. Now they are all racers. At the present time the experiment of a steam seiner is being made, and bids fair to be abandoned, the advantage of speed being overbalanced by

fore he finds it out; if they don't, he will know the fact in about twenty-four hours. Twelve of the crew were Nova Scotia men, naturalized Americans who made Gloucester their home, and the rest were native Americans from various towns on the Maine coast. This ratio will hold throughout the fleet, if a sprinkling of Scandinavians, Portuguese and French are added.

A typical example of the longevity of these men was our "oracle," an old salt almost seventy years of age, who was continually airing his views and who reminded one of the ancient prophets, for he had no honor among the crew. Nobody would listen to him, but that did not prevent his pulling an oar and doing his work with the best. Our youngest was a Nova Scotia man, about twenty-four years old, the recipient invariably at meal time of the table jokes, on account of his long continued and death-like sleeps and his enormous carrying capacity. The fact that he had the previous winter done that which no fisherman will do unless pushed to it, made a trip to the banks, also caused him to be singled out as a victim. For this particular trip, after vainly casting around ashore in

the hope of finding a job to tide him over till the next mackerel season, Jim, with his money gone and his wits at a low ebb, had shipped with a hard-headed and hard-lucked Franchman for a midwinter cruise to the Grand Banks. After three months of gales and seas, which for days removed all possibility of going in the dories, which dragged the trawls and set adrift the buoys; cold which encrusted the vessel in six inches of ice over night and necessitated incessant chopping by day; sickness, and one burial at sea, Jim again set foot in Gloucester. His share for the trip did not amount to as much as an ordinary day laborer can make in a week.

In winter when the mackerel are gone they seek a change in occupation. A few go to the banks, or to Nova Scotia for frozen herring, some on coasters or South American freighters, many become carpenters—they are very handy with tools—or ice cutters, or work for the firm in Gloucester, skinning fish, or doing odd jobs, even to being motormen or conductors in the towns throughout New England. Anything to keep them busy until the next season.

Career of our captain, a magnificent specimen of American manhood, in the prime of life, almost 6ft. in height and big all over, is typical of the training which these men receive before they reach this coveted position. On the banks at eleven years of age, he had at different times followed all branches of the business, filled ice houses, worked in shipyards, skinning and drying lofts, gone as mate and captain of a coaster and finally captain of a seiner, after an experience with sea and fish in all their moods, covering a period of over forty years. A fund of useful knowledge he was, too, of good education, one of the most noted "killers" in the fleet, and a man who enjoyed the respect of his men and the confidence of his employers.

The routine work on board the seiner is very light.

"USE FOR THE BARRELS."

A full crew consists of eighteen men and a cook, and they receive equal shares of one-half a catch, after a few minor expenses have been deducted. "Cookie" receives a bonus of \$1 per day and the captain an extra 4 per cent. The watch is stood by two men at a time, one hour at the wheel and one at the masthead on lookout, and as there is very little shifting of sails the rest of the time is spent very much as each man wishes. Breakfast begins the day at 4 o'clock, with dinner six hours later, supper at 3:30 being the last of the regular meals. The food is good, fish and corned beef, potatoes, mackerel (after a catch), beans, pies, puddings, tea and coffee being the principal items. The larder, or closet, as it is called, is handy and frequently replenished, so that there is no danger of underfeeding.

The fact that mackerel are now much scarcer, and so harder to find, than they were thirty or forty years ago, contributes a charm to a midsummer cruise on one of these vessels, which no other branch of the fisheries can offer—unless it be the swordfishermen. They are continually on the move. If fish are reported off George's Bank, all vessels in harbor from Cape Cod to Mt. Desert get the news and sail at once. By the time they reach George's, the fish have possibly disappeared, and so they cruise around continually making harbor and speaking vessels in order to hear the latest. No reporter is keener for a beat than your mackerel captain for reports of fish. With almost 100 of these vessels continually on the go, the waters from Cape Sable to Cape Cod and east a couple of hundred miles are raked as with a fine tooth comb countless times during the summer.

Not the least remarkable feature of the business is the speed with which they will discover a vessel which has just made a catch. I well recollect one morning, when at daybreak we sighted two vessels some four miles to windward, their headsails down, the sure sign of a catch. Gasolene served us better than the wind, which was light, and enabled us to net a \$1,000 school, about sixty-five wash barrels. When we made our strike at 5 o'clock there were five vessels in sight from the masthead. At 10:30 the fleet numbered fifteen. They jogged along from all points of the compass, seemingly with no other guidance to this particular spot in the ocean, 180 miles off shore, than that marvelous instinct that enables a good captain to smell fish, as it were, if he is within thirty or forty miles of them.

The chief interest and business of the cruise begins, of course, when fish are sighted. You will be sailing along slowly in a soft sou'wester, dozing on deck in

the sun abaft the cabin roof, with your mates possibly occupied in the same way or asleep in their bunks below, when suddenly will come the cry from aloft, School to sta'board!" The vessel is awake in an instant. Up come the men, with their oilskins handy, should the captain, who has gone aloft at the call, satisfy himself that the fish are mackerel, and not squid, porgies or kyacks. He alters the vessel's course a couple of times, gives the order to take to the boat, notes the size of the school, the direction in which they are traveling, and finally comes sliding down the side stay to find the seine boat alongside, the seine unlashd and the ten rowers and the three heavers in their places. All of which has occupied about a minute and a half from the time we received the order to man the boat. But where are the fish? Ah, there they rush! with a great rippling on the surface, and after them we go! every man putting his back into it! Within striking distance, the end of the seine is thrown over, the purse line pitched up by the dory and away it is to surround the fish. No easy work is this for anybody. Quarter of a mile, the length of the seine, must we row, with every ounce of power, every oar bending, three men heaving that heavy seine, the bottom or purse line of which sinks 120 feet below the surface, and the captain swinging the boat with his huge oar, before we have completed the circle and received the other end of the line from the waiting dory. All that remains now is the pursing and we will have them, and if you thought the rowing heavy work, what will you call this! Three men at each of the two cranks with frequent spells make the machine hum; but you can't help thinking you've fouled some old sunken derelict or the bottom, the drag is so tremendous. Five minutes will complete it, however, and then you mop your brow and wonder what you've got. So you begin hauling in the corks at bow and stern and the seine over the side of the boat.

There comes a mackerel, caught in the twine. Heave him back. And another, and another, more and more frequently, till you realize that you have made a catch, and that now there will be some use for those empty barrels down in the hold. The vessel, which has been standing back and forth nearby then comes up, and the fish are dumped into the pocket alongside, and from there bailed out onto the deck by means of heavy long-handled nets. They are then iced, if the captain decides to run them in fresh, or split down the back, cleaned, salted and allowed to stand in barrels on deck until well packed. The next day the barrels are headed, holes bored in the sides through which the pickle is introduced and they are then sealed and stowed in the hold. Twenty minutes later the vessel is as clean as when she left port.

Do not imagine that success is the rule in catching these fish. The odds are all against the fisherman. The sun may be too bright, the fish—they are usually wild—may swim out of the open side of the circle before you have surrounded them, the seine may be fouled and allow them to escape over the corks or underneath, while large schools, aided by a shark or two, have been known in their mad rushes to tear holes in the net large enough for a whale to go through. Instinct is their surest safeguard, and when they bring this into play, you will see them lie on the surface watching that hole underneath grow smaller and smaller, until just when you think you have them, down they go to come up on the other side of the net. All that is left for you will be a dory load. It is not at all unusual for ten or twelve sets to be made in one day and not a barrel caught. As a general thing they school better just at daybreak and dusk, while many good catches are made at night when they are betrayed by the phosphorus in the water. The catches run as high as 700 barrels in one set, but are generally from 60 to 100 barrels; 200 barrels in the hold and a fair priced market, say \$18 a barrel, will tempt any captain to make a quick run to port to unload.

The rivalry between the vessels is intense, and no greater distinction can come to any captain than to be high line of the fleet at the end of the season.

After leaving the vessel the careful fisherman will find the results of his season's labors to be an addition of from \$300 to \$800 to his bank account, and with his health at 100 per cent, he will then begin to look around for some occupation to keep him going until the mackerel fleet will again set sail out of Gloucester.

PHILIP L. BOUTILLIER.

## Fish Chat.

BY EDWARD A. SAMUELS.

### Concerning Tackle for Trout.

IT is only enthusiasts who begin their trout fishing on April 1, but there are a host of them, and the provident ones have already got their tackle in first class shape; but the improvident anglers far outnumber the others, and a few suggestions to such will, perhaps, not be out of place here.

In the first place those who use the split bamboo rods—and most anglers do nowadays—find it to their advantage to take them to the rod maker and have them examined carefully for splits and cracks, and then varnished. It is astonishing how quickly a tip will snap if an old and apparently insignificant crack is neglected through the winter, and it is not necessary that the fibres of the wood shall be broken at that; cracks in the varnish beneath which the water has penetrated to the wood and soaked into it in a greater or less degree weaken the rod very much, and even if it is in perfect condition so far as injuries go. I am one of those who believe that it should have a coating of proper varnish every season in which it is used.

The ferrules, with long continued casting, may have become so worn that they slip apart often at a very critical time; more than one good trout have I seen lost by the rod separating at one of the joints, while the fish was being played. The ferrules made nowadays are as near perfection as can be, both as to fit and durability, they are vastly better than those which were made ten or fifteen years ago, and if one has a rod that is still capable of doing good work and the ferrules on it have become worn, he will get better service from it if he has them replaced by modern ones.

FISHERMEN OF GLOUCESTER.

A year or two ago I had two of my rods thus repaired, and they are now fully as good as they were when new. If the reels were not overhauled when they were put away last fall they should be attended to now; on removing the plates one will find that considerable dirt has worked in between them, and they are encrusted with more or less greasy gum. This should be wiped carefully away and a few drops of fine oil put on all the bearings. It is also very important to examine and thoroughly test the line; one cannot afford to take any chances with a weak line when angling for large trout. Careful anglers before they put their lines away in the fall stretch them out in the sun to dry; if there is a strand here and there from which the varnish has been chafed or worn off, the line becomes saturated with moisture far beyond where the bare spots occur, and if they are left on the reel without first being thoroughly dried, they rot and weaken very considerably in a few months. This chafed condition is most pronounced for a yard or two of the line, which is drawn back and forth through the loop at the end of the tip in casting.

I once saw that enthusiastic angler, the late T. B. Stewart, of New York, lose a magnificent trout at the Upper Dam on the Rangeley Lakes, Me., through his line breaking just before the fish could be saved with the landing net. I shall always remember the expression on Mr. Stewart's face when the rod sprang back and the fish went down the stream out of the pool. He told me subsequently that he knew perfectly well there was a badly chafed spot on the line, which by rights should have been cut out, but he had no idea the strands had become so weakened. After that accident he always tested his lines every season before he used them. It was a good seven pound fish that he lost, and a man less philosophical than he was would have used very strong language when the trout hurried away.

### Leaders and Flies.

It is economy to purchase and use only the very best leaders or casting lines; a saving of a dollar or so in buying a half dozen of an inferior grade is not economy at all. The very best all round gut that is put in tackle shop leaders is none too good, and for a number of years I have found that I got more satisfaction from leaders that I tied myself, and I searched pretty carefully for the best gut for them before I purchased it.

There is a prevailing notion that leaders a year or two old cannot be depended upon. I have proved the

contrary, for I have found that casting lines which I had had four or five years in my book would stand as severe a strain as those which were newly tied.

The fly book will, of course, have to be replenished, and the angler who has a good bank account can draw on it pretty heavily if he chooses, for the tackle stores will offer him an endless variety to choose from. Every time I go into one of those establishments I discover new varieties that have been created by the fly-tyers, and many of the old standard kinds seem to have disappeared. While I do not believe in buying flies by the gross, I hold that the angler should always have a good supply of sizes and varieties adapted to all conditions of the weather and water.

There are eight or ten standard flies, of each of which one should have at least a half a dozen of different sizes in his book. I have already, in *FOREST AND STREAM*, named a number of kinds that always may be relied on; of these the silver-doctor, in different sizes, is one of the most valuable, Parmachene-belle, royal-coachman, red ibis, gray drake, light and dark Montreal, coachman, grasshopper, and hackles brown, red, gray, and black, should be in every book. It is very often the case that hackles will rise fish when all other flies fail, and I have seen heavy trout killed on these little hairy lures which seemed at the time too insignificant to attract the attention of such fish. A year or two ago I stated in *FOREST AND STREAM* that it is good economy to have one's flies tied to order, for a large percentage of the store flies are not always made upon honor; the silver-doctor, for example, as ordinarily sold is made up with very thin hackle-dyed feathers and common tinsel for the body. A little additional cost will secure a genuine silver-tinsel body, a little thicker hackle, and feathers from the crest of the golden pheasant. This tinsel never tarnishes, the feathers never fade, and the fly, until it is absolutely worn out, almost looks as bright and good as it was when new.

One may always rely on carefully tied flies which have been tested, and their additional cost seems trifling when we consider the satisfaction that is derived from their use. The average run of store flies are rather loosely put together, and many a good fish has been lost in consequence of a loop or snood pulling out, or the hook itself becoming detached from the body of the fly; and it is sometimes the case that such flies come apart, even when one is casting.

#### A Fishy Deception.

In casting for trout, one sometimes meets with strange surprises. On one occasion I saw a well-known angler of this city hook and play, what he supposed to be a large trout, fully a quarter of an hour before the fish came to the landing net; it was in the good, old times when fly-fishing in "the run" just above the Middle Dam on the Rangeleys was a sport worth going far to obtain. "The run," as it was called, was really the outlet of the Welokennebacook Lake, the fourth in the Androscoggin system, the water was pretty deep and the current was not very rapid; in fact, most of the time in early autumn there was hardly any perceptible motion to it, but how the big trout used to congregate in it! The run itself was about 200 feet broad, but the channel, where it was deepest and where the fish most loved to abide, was only a good cast in width; it was a celebrated locality among anglers, and I have seen a dozen at a time stationed a rod or two apart on the shore, offering their lures to the splendid fish that were hidden in the deep water before them. They were all enthusiasts, and among them were some of the most distinguished men of their time.

On the occasion I refer to one of the gentlemen rose and hooked a strong heavy fish, which, after making two or three short, spiteful runs, settled down to the bottom where it moved about, here and there, apparently determined to stay there during the remainder of the open season.

"Ah! ha! boys!" he exclaimed, "I'm fast to jumbo this time, sure!" and we all agreed that he probably had hooked the prize trout of the season.

Well, the fish was not worth the long story, for after he had played it until it was exhausted and he got it where the landing net could encompass it, it proved to be a three pound chub, the largest specimen of its species any of us had ever taken. And what an expression of disgust and disappointment was on the face of the angler as he lifted the fish and held it up before us.

Say nothing about it, boys," he exclaimed "and the 'rumb' is on me to-night."

That run now alas! is entirely obliterated, for the new dam that was constructed a number of years ago has raised the water in the lake so high that every vestige of the old fishing ground is entirely lost to sight.

#### Live Bait for Trout.

As I have already stated, the average angler must depend on bait in spring fishing for trout, the use of the fly in icy and melted snow water bringing very unsatisfactory results. In large brooks, rivers, and the deep water of lakes, the minnow is by far the preferable, and most sportsman like bait, and my best success has been with the red fin dace, and next to that the common shiner and striped minnow have proved most attractive to the trout. But these are not always obtainable; in fact, nine bait anglers out of ten have to depend on the common angle worm, and such is the bait that is generally used in most of the hurryscurrying mountain brooks, in which it is only now and then that a pool six inches in depth is found in which the angler can drop his lure; in these his dependence is placed on the worm bait during the entire season. In these little brooks the trout rarely, if ever, exceed six inches in length, and they have to be picked out with a rather stiff bait rod, as soon as they are hooked.

It is astonishing how far the little beauties ascend those mountain streams. I remember once following one of these brooks in all its meanderings and twisting near Gilead, Me., for nearly six miles, and trout had in some way wiggled up over the shoal places into all the pools which were, of course, small until the brook became a mere tinkling little rill. How they managed to ascend so far was a puzzle to me, and I concluded

that they were a good deal like a birch canoe that will float quite comfortably over dew-moistened grass—as guides sometimes declare. On that occasion my companion and I picked out enough of the trout to satisfy our desires, and we left many more in the brook than we caught.

How those fish managed to get through the winters when the brooks must be almost frozen through is hard to say. Ordinarily, in similar streams they must ascend to deeper water, but those in the brook I refer to, could not safely go into deep water, for it emptied into the Androscoggin River, in which there was an abundance of pickerel, whose predatory habits every trout is always anxious to avoid.

#### Choice Angleworms.

Now everybody knows all about the ordinary angle worm, and is satisfied to use it in its normal condition, but there are some anglers who are rather fussy about this kind of bait. My old friend, John Moore, who was at that time editor of one of the Concord, N. H., papers, kept his in damp moss which he sprinkled occasionally with indian meal moistened with sweet milk; the worms when thus treated bleached until they were almost white, and they seemed to become tougher than worms usually are in their normal condition. He was an enthusiast in brook trout fishing, and he would talk on that subject for hours, and interestingly, too.

Now, the ordinary sized angle worm is not a very tempting morsel to the great trout of the Rangeleys, unless "one had a whole gob of 'em on his hook," as one of the guides used to say. But bait fishermen, when minnows were not to be obtained, used to secure a supply of the big earth worm that comes out of its burrow only at night.

With feet clad in moccasins, in order that their tread might be as light and noiseless as possible, with lantern in hand, they walk stealthily about in search of the worms; these were most commonly found in pasture lands and other stretches of open sward, and they come out at night to feed. Huge fellows they were, six inches in length, with fat, yellowish bodies and bronze-colored heads. They never left their burrows entirely, but maintained a hold on them with the extremity of their tails, and the celerity with which they slid back into the earth when it was jarred was simply astonishing.

The worm hunter, on discovering one of these long, slimy bodies glistening in the light of the lantern, in order to secure it, was obliged to creep noiselessly toward it until he could reach it with his hand, and then he captured it only by pouncing upon and grasping it as quickly as possible. A dozen or two of these monsters sufficed for a day's fishing, and in the water their long, wriggling bodies, through which the hook was passed three or four times, proved such tempting bait that no trout could resist seizing it. It was with one of these angle worms that the eleven pound trout, that was caught at the Upper Dam and which was sent to the Smithsonian Institution, was captured.

### Fish and Fishing.

#### Canada's Alpine Chars.

A GROWING interest is being manifested by anglers and others in the numerous variations and somewhat muddled nomenclature of the Canadian chars. Almost every season I am indebted to some of my many angling friends for specimens of peculiarly marked trout as they are usually called, almost all of which are chars, and the great majority of them simply uncommonly colored specimens of *Salvelinus fontinalis*, or the commonly called American brook trout. It is quite surprising how much difficulty there is in persuading the ordinary unscientific angler that several of the extraordinarily marked specimens of the common American brook char do not constitute a distinct variety. Nevertheless, it is always quite interesting to receive specimens differing in any way from the more common examples of our native fish, though for the lack of sufficient material in the local museums for proper comparative studies, I usually find it advisable to forward doubtful specimens to the Museum of Comparative Zoology at Cambridge. In view of the approach of the coming angling season, I should like to indicate to anglers fishing in Canada, how desirable it is that several specimens of any novel variety of fish should be forwarded, when any at all are sent to those interested in their identification or nomenclature. It is almost impossible to speak positively as to the proper classification of an unusual specimen, in some instances, at least, unless supplied with both young and adult specimens of both sexes.
